FINAL ENVIRONMENTAL IMPACT STATEMENT

Submitted Pursuant to
Chapter 343, Hawai'i Revised Statutes
and
Title 11, Chapter 200, Hawai'i Administrative Rules

Prepared for:
D.R. Horton - Schuler Division

Prepared by:
PBR HAWAII
& ASSOCIATES, INC.

This Final Environmental Impact Statement and all ancillary documents have been prepared under my direction or supervision and the information submitted, to the best of my knowledge, fully addresses document content requirements as set forth in Chapter 343, Hawai'i Revised Statutes and Section 11-200-17, Hawai'i Administrative Rules.

Dean Uchida, Vice President
D.R. Horton - Schuler Division

July 2008

AR00027023

Executive Summary

EXECUTIVE SUMMARY

DESCRIPTION OF THE ACTION

The Proposed Action involves development of a mixed-use community in 'Ewa which entails the reclassification of approximately 1,553.844 acres from the Agricultural District to the Urban District (Petition Area). Urbanization of the Petition Area will enable the Petitioner ("Petitioner" and "Applicant" used interchangeably, as discussed in Section 1.0, Introduction) to develop the proposed Conceptual Land Use Plan. The proposed plan for Ho'opili – which means "coming together" in Hawaiian – reflects the ideas, hopes and dreams of what the community wanted to see from and within Ho'opili. The plan reflects the community's desire for vibrant and safe neighborhoods where people feel a sense of connection with one another, and with the rest of O'ahu.

The Conceptual Land Use Plan reflects the desire for a community that is complete, with: employment centers; quality schools; shopping, gathering and recreational places; and parks and open space for residents; and diverse, including affordable, housing options. Residents will live, work, learn, play, and shop in one area. In addition, Ho'opili will incorporate green building practices to be an environmentally-sound, healthy and resource-efficient community.

To achieve the vision for Ho'opili, a Conceptual Land Use Plan has been formulated that illustrates a mixed-use community that would complete and connect 'Ewa with surrounding communities. Originating from the common vision and values of a community-driven planning effort, the conceptual plan contains a series of neighborhoods with a mix of uses including residential, retail, office and light industrial. Included in this mix are a series of parks, schools, public buildings and community centers which act as a focus and help define the identity of each neighborhood. Additionally, the project was designed in consultation with adjoining landowners, such the Department of Hawaiian Home Lands (DHHL), the University of Hawai'i at West O'ahu (UHWO) and the Hawaii Community Development Authority (HCDA).

Ho'opili is planned to be connected to the surrounding 'Ewa District (and neighboring DHHL, UHWO and HCDA properties) by a network of streets and bicycle paths which should allow a variety of circulation options for residents and visitors. During the public review period, the Hawai'i Community Development Authority (HCDA) wrote that: "The HCDA supports the development of an internal network of closely-spaced gridded streets and bike paths linking the project to the surrounding communities of University of Hawaii West Oahu (UHWO), Department of Hawaiian Home Lands (DHHL), Ewa Villages, and the KCDD. This objective is consistent with the HCDA Kalaeloa Master Plan. Improving connectivity throughout the region was one of the most important issues identified during the strategic planning meetings for the region as well as the KCDD. The extension of the

AR00027025

Kapolei Area Bikeway Plan to include UHWO, DHHL, and the KCDD in the DEIS is also noteworthy and consistent with our Master Plan."

Wider tree-lined boulevards are intended to create a distinct axis running north-south and east-west across the site. Ho'opili is being designed to be transit-ready, and the land use plan, while subject to change, has been designed to accommodate a high-capacity transit corridor either along Farrington Highway or diagonally through the project site, with either one or two transit station locations. Also possible is a transit maintenance and storage facility. While the proposed residential unit count should not materially change, it will need to be adjusted depending on the final alignment of the high-capacity transit corridor, as ridership generation, "capture" of transit-oriented development potential and the potential for noise impact from an elevated high-capacity transit alignment would likely require taller, higher density residential or industrial uses along the alignment. The final siting of the transit station location(s) will concentrate higher intensity development (and density) around the transit station(s). A site for a transit maintenance and storage facility is also possible. (As of this writing, the City and County of Honolulu (City) has begun work on the Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor (HHCTC) project, with a target publication date in the second quarter of 2008. By the time the HHCTC Draft EIS is published, the final alignment of the high-capacity transit corridor, the location of transit stations, and the location of the transit maintenance and storage facility will be known).

In the geographical center of the site there is a public square or Civic Plaza that is surrounded by higher density housing development and mixed-use buildings. Housing density transitions to lower-density small-lot single-family homes along the eastern and southern peripheries of the site. A significant open space and pedestrian/bicycle trail network provide a wide variety of recreational opportunities for residents and other members of the 'Ewa community. Ho'opili is planned to incorporate traditional Hawaiian building styles with a modern, contemporary aesthetic that befits the landscape and climate.

SIGNIFICANT BENEFICIAL AND ADVERSE IMPACTS

The development of the proposed project will impact Petition Area resources; however, past and current agricultural uses of the property have significantly altered the natural landscape. Among the many regional transportation improvements long-planned by the State of Hawai'i (State) and the City and County of Honolulu (County) include: the proposed Honolulu High-Capacity Transit Corridor (HHCTC) mass-transit project; the completion of North-South Road and a new H-1 Freeway interchange; and the widening of Farrington Highway. Portions of each of the aforementioned regional transportation projects (as well as the recently proposed East-West Connector (connecting Farrington Highway to Fort Weaver Road through UHWO, DHHL and Ho'opili) will require land area from under the Ho'opili project.

AR00027026

Ho'opili has been planned with the reduction of traffic impacts in mind. First, it includes transit-oriented development. Bus lines have been identified to encourage residents throughout the project to use rapid transit or to use buses or bicycles within the project area. Street sizes and connectivity will encourage pedestrian and bicycle movement. To the extent that automobile use declines (or Ho'opili attracts new residents who are less committed to automobile use than others), residents can expect to have more exercise, and be healthier than people in other subdivisions of Leeward O'ahu.

Ho'opili will contribute to the growth of the urban community life in 'Ewa by providing new job locations, recreational areas, and schools as well as housing. It is designed as a community in which many residents will not need to drive to Honolulu often. Its transportation planning will work to address the region's serious traffic congestion problems. It will help to link existing and new communities, serving its neighbors as well as its residents.

PROPOSED MITIGATION MEASURES

Various mitigation measures will be implemented throughout the development of the proposed Ho'opili project to minimize impacts on the environment. Infrastructure improvements will incorporate appropriate engineering and design methods to meet basic infrastructure requirements.

Drainage/Flood Control/Water Quality/Soil Erosion. All grading operations will be conducted in accordance with dust and erosion control and other requirements of the City and County of Honolulu Grading Ordinance. All construction activities must comply with the relevant provisions regulating Fugitive Dust set forth under Section 11-60.1-33, Hawaii Administrative Rules (HAR). A grading permit is required to modify the topography, and additionally, a National Pollutant Discharge Elimination System (NPDES) permit will be required prior to construction to address ~~non-~~point source discharges.

Archaeological Resources. An archaeological inventory survey report prepared for the Petition Area has been accepted by the State Historic Preservation Division (SHPD) in fulfillment of Sections 13-284 and 13-276, HAR. In addition, a preservation plan and archaeological monitoring plan is being prepared and will be submitted to SHPD for its review and approval. If burials are encountered during project construction, the Petitioner will comply with the relevant notification and stop work requirements.

Noise. Noise will be generated by construction and earth-moving equipment during the project's development. However, construction noise will be relatively short-term (in the vicinity of where construction will occur), occur only during daytime hours, and comply with State Department of Health (DOH) noise regulations. If construction noise is expected to exceed DOH's maximum permissible property line noise levels, a permit will be obtained from the DOH to allow the operation of vehicles, construction equipment,

AR00027027

power tools, et cetera. Additionally, construction equipment, vehicles, or devices will be equipped with mufflers, as necessary.

Air Quality. During all phases of construction, there is a potential for fugitive dust emissions. These short-term air quality impacts will be mitigated by the implementation of a dust control management plan and compliance with the relevant provisions on Fugitive Dust set forth under Section 11-60.1-33, HAR.

After project construction, long-term impacts to air quality can result from increased activity within the Petition Area. Vehicles will increase exhaust emissions, although public transportation will be encouraged by proximity to the planned transit nodes and corridors. Stricter vehicular emission controls will also help to mitigate air quality impacts. The project is being designed to promote walking/biking by integrating land uses. This should encourage residents to walk/bicycle from home to work, school, day care, retail outlets, and parks and trails, and reduce the reliance on the use of personally-owned vehicles for commuting to work, going to the park, going shopping or attending school.

Transportation. As previously mentioned, there are several major transportation projects that have been long-planned for 'Ewa. The Ho'opili project has been planned assuming that certain planned transportation projects will be constructed including a portion of North-South Road between Farrington Highway and Kapolei Parkway; a portion of the North-South Road and a new H-1 Freeway interchange; a portion of the intersection of North-South Road and Farrington Highway; the long-planned widening of Farrington Highway fronting the Petition Area; the proposed East-West Connector Road through the Petition Area; and the segment of the proposed HHCTC mass-transit project through the Petition Area.

The proposed project has been designed to reduce future residents' reliance on private motorized vehicles through the following measures:

- the project is the first new project designed to ~~embrace~~ support the City and County of Honolulu's plan to develop a high-capacity transit (elevated, fixed-guideway) corridor and station(s) (and possible maintenance yard);
- the project is large enough to be designed and offer a full range of mixed land uses, including a wide range of places of live, work, shop, recreate and learn and will aspire to achieve a job-housing balance;
- the project is designed to maximize connectivity (transit, pedestrian, bicycle and vehicular) with surrounding streets and communities (including DHHL and UHWO), while minimizing cul-de-sacs and dead-end streets;
- the project will be designed to take advantage of the relatively flatness of the site and proximity to UHWO by designing streets and grade-separated multi-modal pathways for walking and bicycling; and

AR00027028

- the project will seek to implement other transportation management and transportation demand management strategies (such as requesting that the State/County consider extending or instituting contra-flow of major transportation corridors during a.m. and p.m. peak travel times).

Visual Resources. The visual appearance of the Petition Area will change from vacant scrub and cultivated vegetation to a landscaped mixed-use community with parks and open space. This is consistent with the *Kapolei Area Long Range Master Plan* as well the *Ewa Development Plan*. Project landscaping, the provision of open space buffers, and sensitive architectural design will help to establish the planned community visual character of the area.

Infrastructure/Public Facilities/Utilities. The de facto population associated with the project will require potable water (i.e., drinking water) from the existing municipal water system (including the existing source, transmission and storage components of the Board of Water Supply (BWS) safe drinking water system). It will be a requirement that the project provide system upgrades to the transmission and storage components to ensure that the system operates effectively and meets BWS standards. With respect to non-potable water requirements, the project will be maximizing non-drinking usage to minimize the demand on the safe drinking water system. Street right of ways of the Ho'opili project will have underground non-drinking distribution systems.

Over time the project will result in an increase in wastewater being generated than currently being generated on-site (by agricultural activities). To mitigate this effect, new collection system components consisting of gravity sewer, pump stations and relief sewers will be constructed. To date, the Petitioner has already contributed $2 million towards increasing the capacity of the Makakilo/Kapolei Interceptor sewers from the intersection of North-South Road to the Honouliuli Wastewater Treatment Plant (WWTP). The project will generate additional flow that must be treated at the Honouliuli Wastewater Treatment Plant (WWTP). To mitigate the additional burden, the project will participate in the Wastewater System Facility Charge (WSFC) program and contribute funds (based on building permits) to expand the treatment plant. Land is available at the Honouliuli WWTP site to allow for expansion.

The project will increase impervious surfaces such as roadways, roofs, paved parking areas, and sidewalks. These surfaces will cause an increase in storm water discharge within the Petition Area. However, detention basins and/or retention basins are being planned and sited to detain and/or retain storm water to ensure that areas downstream of the project are not impacted.

AR00027029

Surface water quality can be impacted through development. The project will be providing detention basins to meet City and County of Honolulu Standards for water quality treatment. Structural methods may also be used to meet water quality requirements of the Rules Relating to Storm Drainage Standards. Structural methods include the use of Stormceptor® type storm drain manholes.

For the portion of the Petition Area within the West Loch drainage basin, it is planned to collect all storm water and route it to an existing detention basin located on the east side of Fort Weaver Road and south of the Oahu Railway & Land (OR&L) railroad tracks. The basin would be expanded to ensure that the water quality storage component of the City and County of Honolulu Standards was achieved. While there are existing drainage easements under Fort Weaver Road, additional drainage, access and utility easements may need to be obtained under Fort Weaver Road and other State and County road right-of-ways.

Solid Waste. Project construction will conform to the guidelines and objectives of the Integrated Solid Waste Management Act, Chapter 342G, Hawaii Revised Statues (HRS). Construction will also comply with the City and County of Honolulu's approved integrated solid waste management plans in a schedule and time frame satisfactory to the DOH. The goal for waste management is to appropriately reduce, reuse and recycle materials, to minimize generation of solid waste and achieve diversion from landfills. As such, in conformance with Section 344-4(2), HRS, the project will promote the optimal use of solid wastes through programs of waste prevention, energy resource recovery, and recycling. The City and County of Honolulu is restarting its curbside pick up recycling program. In November, 2007, two pilot curbside recycling programs began in Mililani and Hawai'i Kai. During the six to twelve month evaluation period, the City and County of Honolulu Department of Environmental Services staff will be coordinating plans for islandwide expansion.

On June 27, 2008, the Associated Press reported that Mililani and Hawai'i Kai residents have recycled 54 percent of their cans, bottles, newspapers and green waste during the city's six-month curbside recycling pilot project. City Officials with the City and County of Honolulu Department of Environmental Services (DES) are reportedly satisfied with the results and are moving forward with plans to provide some 160,000 O'ahu homes the curbside recycling service by May 2010. In the new plan, the city will collect garbage and recyclables each once a week. The DES will no longer have garbage pickup twice-weekly. A study released by DES predicts the program will divert an estimated 53,800 tons of mixed recyclables and green waste from O'ahu landfills. They plan to begin expanding the program to more communities in November 2008.

ALTERNATIVES CONSIDERED

Development of the 'Ewa region as O'ahu's Second City has been studied and planned for over three decades. Further study or delay of any proposed development on the property

AR00027030

would not be consistent with the *Ewa Development Plan* or the County's objective of directing growth to 'Ewa. Therefore, various alternatives for the site were rejected, such as: 1) continued agricultural use; 2) locating the 1,554-acre development elsewhere on O'ahu; 3) more density (with the same number of units as proposed) resulting in more open space; and 4) less density, less open space; as it would not achieve the overall objectives for the project, which would create a mixed-use community including residential, business, and commercial areas, schools, parks and open space.

UNRESOLVED ISSUES

Honolulu High-Capacity Transit Corridor (HHCTC) Alignment Through Ho'opili. As of this writing, the high-capacity transit corridor alignment through Ho'opili has not been finalized by the City and County of Honolulu. As previously noted, Ho'opili is being designed to be transit-ready, and the land use plan, while subject to change, has been designed to accommodate a high-capacity transit corridor either along Farrington Highway or diagonally through the project site, with either one or two transit station locations. While the proposed residential unit count should not materially change, it will need to be adjusted depending on the final alignment of the high-capacity transit corridor, as ridership generation, "capture" of transit-oriented development potential and the potential for noise impact from an elevated high-capacity transit alignment would likely require taller, higher density residential or industrial uses along the alignment. The final siting of the transit station location(s) will concentrate higher intensity development (and density) around the transit station(s). (As of this writing, the City and County of Honolulu has begun work on the Draft EIS for the Honolulu High-Capacity Transit Corridor (HHCTC) project, with a target publication date in the second quarter of 2008. By the time the HHCTC Draft EIS is published, the final alignment of the high-capacity transit corridor, the location of transit stations, and the location of the transit maintenance and storage facility will be known).

State of Hawaii Department of Education (State DOE) School Fair Share Requirements. The Petitioner is currently coordinating with the State DOE regarding the number of schools that will be required for the development of the Ho'opili project. <u>During the Draft EIS public review period, the DOE commented that it will determine the actual number of schools required for the Ho'opili development after the developer provides more definitive data on respective market prices, size, and number of bedrooms for each type of unit planned.</u> This will be identified as an unresolved issue until the number of schools required is finalized.

Drainage. The Petition Area falls within three different drainage basins. The portion of the Petition Area within the West Loch drainage basin is planned to collect all storm water and route it to an existing detention basin located on the east side of Fort Weaver Road and south of the OR&L railroad tracks. The basin would be expanded to ensure that the water quality storage component of the City and County of Honolulu Standards was achieved. An overflow from the detention basin would discharge to the West Loch of

AR00027031

Pearl Harbor. The overflow from the proposed makai detention basin would have to cross Navy property. Permission of the Navy would be required. The concept of the overflow across Navy property is not new and was approved in concept back in the early- to mid-1990's. However, as of this date, the Navy has rejected any considerations to allow increased runoff to cross Navy land. Permission from the Navy needs to be resolved for the overflow option to move forward, otherwise the detention basin system for the West Loch drainage basin will need to be expanded to retain all increased runoff generated in the West Loch drainage basin.

COMPATIBILITY WITH LAND USE PLANS AND POLICIES

State Land Use Law, Chapter 205, HRS. The Petition Area is within the State Agricultural District. As such, a State Land Use District Boundary Amendment is being sought to change the site's district boundary from the Agricultural District to the Urban District.

Coastal Zone Management Program, Chapter 205A, HRS. All lands of the State of Hawai'i are included within the Coastal Zone Management (CZM) Area as defined in Chapter 205A, HRS. As such, the Petition Area is within the CZM Area; however, it is not located along a shoreline or within the Special Management Area.

Hawaii State Plan, Chapter 226, HRS. The Hawaii State Plan (Chapter 226, HRS), which serves as a guide for the long-range growth and development of the State, establishes a set of goals, objectives, policies, and priorities for the State. Conformance to applicable goals, objectives, and policies set forth by the Hawaii State Plan is discussed in detail in Section 5.2.4.

Hawaii State Functional Plans. The Hawaii State Plan is primarily guided by the State Functional Plans (Chapter 226, HRS) and implemented by the State Department of Budget and Finance and the State Land Use Commission (LUC). State Functional Plans are prepared by various state agencies to serve as the primary implementing vehicle for the goals, objectives, and policies of the Hawaii State Plan. The functional plans applicable to the proposed Ho'opili project are discussed in Section 5.2.5.

City and County of Honolulu General Plan. As required by the City Charter, the *General Plan* for the City and County of Honolulu establishes long-range objectives focusing on the social, economic, environmental, and design objectives for the general welfare and prosperity of the residents of O'ahu. The *General Plan* also establishes broad policies designed to achieve the objectives. Conformance with specific elements of the *General Plan* is discussed in Section 5.3.1.

Ewa Development Plan. The *Ewa Development Plan* was updated and officially adopted by the City Council in August 1997 and is presently being updated. The plan presents a vision for 'Ewa's future development and provides conceptual land use plans that will serve as a policy guide for more detailed zoning maps and regulations, and public and

AR00027032

private sector investment decisions. Provisions of the *Ewa Development Plan* that are applicable to the proposed project are discussed in Section 5.3.2.

Land Use Ordinance. The Petition Area is presently zoned AG-1 Restricted Agricultural District by the City and County of Honolulu Land Use Ordinance (LUO). As such, a Zone Change will be required for approximately 1,555.145 acres of the Project Area.

LISTING OF PERMITS AND APPROVALS REQUIRED

As presented below, a list of major permits and approvals is required for the project.

PERMIT/APPROVAL	APPROVING AUTHORITY	STATUS	PROJECT SUBMITTAL DATE
State Land Use District Boundary Amendment (with EIS)	State of Hawai'i Land Use Commission	Petition has been filed; processing on hold until EIS process has been completed.	First Quarter 2007
Zone Change	City and County of Honolulu Department of Planning and Permitting/City Council	Application to be filed assuming successful processing of SLUDBA.	Third Quarter 2009
Large Lot Subdivision ~~Approval~~ Action	City and County of Honolulu Department of Planning and Permitting	Application to be submitted after change the Zone Change application is approved.	Third Quarter 2010
National Pollutant Discharge Elimination System (NPDES) Permit	State of Hawai'i Department of Health	Application to be submitted prior to Building/Grading Permits.	2011
Building/Grading Permits	City and County of Honolulu Department of Planning and Permitting	Application to be filed after the Zone Change application is approved.	2011
Water Use Permit	State of Hawai'i Department of Land and Natural Resources, Commission on Water Resource Management	Application to be submitted prior to Building/Grading Permits	2011

AR00027034

1.0
Introduction

1.0 INTRODUCTION

This EIS is prepared in accordance with Chapter 343, HRS, and Title 11, Chapter 200, HAR, *ENVIRONMENTAL IMPACT STATEMENT RULES*. The applicant, as defined under §11-200-2, HAR, is the petitioner for district boundary amendment presently before the State Land Use Commission and proposes certain actions that would trigger compliance with Chapter 343, HRS, as discussed below. "Applicant" and "Petitioner" shall be used interchangeably to mean D.R. Horton – Schuler Homes, LLC.

1.1 PROJECT PROFILE

The following summary describes the existing entitlements and proposed actions:

Project Name: Ho'opili

Project Location: 'Ewa District, O'ahu, Hawai'i

Petitioner: D.R. Horton – Schuler Homes, LLC, a Delaware Limited Liability Company, d.b.a. D.R. Horton – Schuler Division

Landowner Within the Petition Area: D.R. Horton – Schuler Division

Landowners Outside the Petition Area but within Project Area:
D.R. Horton – Schuler Division
Monsanto Company
United States Naval Reservation
City and County of Honolulu
Hawaiian Electric Company

Total Project Area: Approximately 1,600.265 acres. In addition, the project will require easements over State and County road right-of-ways for the installation of roadways and various infrastructure and utility lines such as water, sewer, drainage, electricity, telephone and communications.

Total Petition Area: Approximately 1,553.844 acres. (While the total Project Area is approximately 1,600.265 acres, it should be noted, that most of the difference in acreage between the total Project Area and the total Petition Area is required for off-site infrastructure which does not need to be located on lands within the State Urban Land Use District. Development of the Petition Area will require easements over State and County road right-of-ways for the installation of

AR00027036

	roadways and various infrastructure and utility lines such as water, sewer, drainage, electricity, telephone and communications. The Petition Area includes lands that would be condemned by various State and County agencies for the completion of North-South Road and its interchange with the H-1 Freeway, a portion of the intersection of North-South Road and Farrington Highway, the widening of Farrington Highway, the HHCTC project, and the proposed East-West Connector Road.
Tax Map Key Parcels:	*Petition Area:* 9-1-17: 04 (portion), 59, and 72; 9-1-18: 01 and 04; *Remainder of the Project Area:* 9-1-10: 02, 14 (portion), and 15 (portion); 9-1-17: 04 (portion); 9-2-01: 04, 05, 06 and 07; and 9-2-02: 02.
Proposed Action:	Reclassification of approximately 1,553.844 acres of land from the Agricultural District to the Urban District, and the use of State and County lands for access, and various municipal infrastructure and utility improvements.
Existing Uses:	Diversified agriculture, pasturage, storage/processing/distribution facility for produce, seed cultivation, agricultural research station, parking for school buses and Handi-Vans.
Proposed Uses:	Development of a mixed-use, transit-ready community including: low-medium density residential/live-work, mixed-use medium density residential, mixed-use/high-density residential, light industrial mixed-use/business, schools, parks, open space and long-planned regional transportation improvements planned by others (including a portion of North-South Road and its intersections, the future widening of Farrington Highway, and a portion of the HHCTC alignment).
Existing State Land Use Designation:	Agricultural District (within the Petition Area) and Urban and Agricultural Districts (outside of the Petition Area)
Existing Zoning Designation:	AG-1 (Restricted Agricultural District)
Ewa Development Plan:	Low and Medium Density Residential, High Density Residential, Agricultural and Preservation, Parks, Transit Node (High Density Residential and Commercial), and Future Intermediate School

AR00027037

Special Designations:	None. Petition Area is not situated in a Special Management Area or in the Shoreline Setback.
Permits/Approvals Required:	Compliance with Chapter 343, HRS and Title 11, Chapter 200, HAR State Land Use District Boundary Amendment City and County of Honolulu Zone Change Grading /Building Permits National Pollutant Discharge Elimination System (NPDES) Permit Subdivision Approval
Accepting Authority:	State of Hawai'i Land Use Commission

1.2 PROJECT LOCATION

The approximately 1,600.265 acre Project Area is located in 'Ewa District, island of O'ahu (See Figure 1.1: Location Map). The Project Area is comprised of ten distinct parcels of land situated in between the H-1 Freeway (north) and Mango Tree Road (south), and in between the proposed University of Hawai'i West O'ahu (UHWO) property (west) and Old Fort Weaver Road (east). The Petition Area consists of 1,553.844 acres and three of the 10 parcels (See Table 1.1: Project Area Tax Map Key Parcels).

1.3 PROJECT AREA

The 10 parcels are identified as Tax Map Keys (TMK) and include 9-1-10: 02, 14 (portion), 15 (portion); 9-1-17: 04 (portion), 59, and 72; 9-1-18: 01 and 04, 9-2-01: 04, 05, 06, and 07 and 9-2-02:02 (See Figures 1.2 – 1.4: Tax Map Keys). For purposes of this EIS, the parcels labeled A through G are shown in Figure 1.5: Parcels Map, and listed below in Table 1.1. Parcels 9-1-10:02, 14 and 15 will be reserved for drainage only, and Parcels 9-2-01:04, 05, 06 and 07 and Parcel 9-2-02:02 will be used for reservoirs and storage, making the Petition Area approximately 1,553.844 acres. An additional 43.297 acres from 9-1-18:04 and 9-1-17:04 in the Petition Area will be condemned by the City and County of Honolulu for the creation of North-South Road.

AR00027038

Table 1.1. Project Area Tax Map Key Parcels

PROJECT AREA	LANDOWNER	PARCEL NAME	TAX MAP KEY	ACREAGE
Petition Area	D.R. Horton-Schuler Homes LLC	A	9-1-18: 04	52.289

		C	9-1-17:04 (portion), 59, and 72	1053.963
			TOTAL PETITION AREA	1,553.844
Non-Petition Area	D.R. Horton-Schuler Homes LLC	G	9-1-17:04 (portion)	1.301
	D.R. Horton-Schuler Homes LLC	D1	9-1-10: 02	30.825
	U.S. Naval Reservation	D2	9-1-10:14 (portion) and 15 (portion)	4.5*
	HECO	E1	9-2-01:04	.243
	Monsanto Company		9-2-01:05	.392
	City and County of Honolulu	E2	9-2-01:06	1.49*
		E3	9-2-01:07	.359
		F	9-2-02:02	7.311
* Approximate Acreage			**TOTAL APPROXIMATE NON-PETITION AREA**	**46.421**
			TOTAL APPROXIMATE PROJECT AREA	**1,600.265**

In addition, the project will require easements over State and County road right-of-ways for the installation of various infrastructure and utility lines such as water, sewer, drainage, electricity, telephone and communications.

1.4 EXISTING USE

The Project Area currently contains cultivated fields for diversified agriculture, pasturage, and agricultural research, and fallow fields formerly used for sugar cane cultivation.

1.5 LAND OWNERSHIP

D.R. Horton – Schuler Division is the owner of the parcels (A, B and C) located in the Petition Area. D.R. Horton – Schuler Division, Hawaiian Electric Company (HECO), the City and County of Honolulu, the U.S. Naval Reservation and Monsanto Company own property situated within the non-petition area of the Project Area.

1.6 PETITIONER

The Petitioner is D.R. Horton – Schuler Homes LLC., a Delaware Limited Liability Company, d.b.a. D.R. Horton – Schuler Division (D.R. Horton).

Contacts: Mr. Michael Jones, Division President
Mr. Robert Q. Bruhl, Vice President, O'ahu Development
Mr. Dean Uchida, Vice President, Ho'opili

1.8 ACCEPTING AUTHORITY

According to Section 343-5, HRS, "The authority to accept a final statement shall rest with the agency initially receiving and agreeing to process the request for approval." Privately-initiated EIS documents must be accepted by the government agency empowered to approve permits for a project. The accepting authority for this EIS is the State of Hawai'i Land Use Commission, hereinafter simply referred to as the "Commission."

1.9 COMPLIANCE WITH STATE OF HAWAI'I AND CITY AND COUNTY OF HONOLULU ENVIRONMENTAL LAWS

This document has been prepared in accordance with the provisions of Chapter 343, HRS, (Environmental Impact Statement Law) and Title 11, Chapter 200, HAR, (Environmental Impact Statement Rules). Section 343-6, HRS, establishes nine "triggers" that require compliance with these regulations. The trigger(s) for the proposed Ho'opili project include, but are not limited to, the following:

- Use of State/County lands and funds.

The proposed project's on- and off- site infrastructure improvements relating to roadway, traffic, water, sewer, utility (electricity, telephone and communications) and drainage facilities may affect State and/or County roadways or other lands. While the specific nature of each improvement is not known at this time, the EIS is intended to address all current and future instances involving the use of State and/or County lands and funds relating to the Ho'opili project.

1.9.1 Studies Contributing to this Environmental Impact Statement

A number of specific technical studies were prepared for the proposed Ho'opili project. These studies are included as appendices to the environmental impact statement and include:

- Agricultural Impact Analysis (Decision Analysts Hawaii, Inc.)
- Air Quality Study (B.D. Neal & Associates)
- Archaeological Inventory Survey (Cultural Surveys Hawai'i Inc.)
- Cultural Impact Survey (Cultural Surveys Hawai'i Inc.)
- Faunal Survey (Rana Productions, Ltd.)
- Flora Survey (LeGrande Biological Surveys Inc.)
- Fiscal Impact Study (Mikiko Corporation)
- Market Assessment Study (Mikiko Corporation)
- Acoustical Study (D.L. Adams Associates, Ltd.)
- Conceptual Water Master Plan (Bills Engineering Inc.)
- Preliminary Wastewater Collection System Master Plan (Bills Engineering Inc.)
- Drainage Master Plan (Bills Engineering Inc.)

AR00027046

- Preliminary Electrical and Communications Master Plan (MK Engineers, Ltd.)
- Social Impact Assessment (Belt Collins Hawaii Ltd.)
- Traffic Impact Analysis Report (Wilbur Smith Associates)
- Arthropod Survey and Assessment (Pacific Analytics, L.L.C.)

AR00027048

2.0
Description of the Project

2.0 DESCRIPTION OF THE PROJECT

This section provides background information and a general description of the proposed Ho'opili project, and discusses the development timetable and preliminary development costs.

2.1 BACKGROUND INFORMATION

2.1.1 Location

The approximately 1,600.265 acre Project Area is located in the 'Ewa District on the island of O'ahu (See Figure 1.1: Location Map). The Project Area is comprised of eleven distinct parcels of land situated in between the H-1 Freeway (north) and Mango Tree Road (south), and in between the proposed University of Hawai'i West O'ahu (UHWO) property (west) and Old Fort Weaver Road (east). The Petition Area consists of 1,553.844 acres and three of the 10 parcels (A, B and C).

2.1.2 Ownership

D.R. Horton–Schuler Division is the owner of the parcels (A, B, and C) located in the Petition Area. D.R. Horton–Schuler Division, Hawaiian Electric Company (HECO), the City and County of Honolulu, the U.S. Naval Reservation and Monsanto Company own property situated within the non-petition area of the Project Area (See Figure 2.1: Current Land Ownership). In addition, the project will require easements over State and County road right-of-ways for the installation of various infrastructure and utility lines such as water, sewer, drainage, electricity and communications.

2.1.3 Surrounding Land Uses

The Petition Area consists of 1,553.844 acres of the 1,600.265 acres in the Project Area. The Project Area consists of 10 distinct parcels of land situated within the Agricultural District. For purposes of this EIS, the parcels have been labeled as A, B, C, D1, D2, E1, E2, E3, F and G (See Figure 1.5: Parcels Map). The Petition Area parcels are A, B and C. The remaining Project Area parcels, D1, D2, E1, E2, E3, F and G, do not need to be reclassified to urban.

Parcel A is located west of Parcels B and C, and north of the UHWO. It is bordered by State land to the west, Farrington Highway to the south, the proposed North-South Road (under construction) to the east, and the H-1 Freeway to the north.

Parcel B is located north (mauka) of Parcel C and Farrington Highway. It is the second largest of the 10 parcels. Parcel B is bordered to the west by land proposed for multi-family residential use by the HCDCH, to the south by Farrington Highway, to the east by Kunia Road, and to the north by the H-1 Freeway.

AR00027050

Parcel C is located south (makai) of Farrington Highway. It is the largest of the 10 parcels. Parcel C is bordered by the proposed North-South Road to the west; State Department of Hawaiian Home Lands (DHHL) landholdings, 'Ewa Villages, and the 'Ewa Villages Golf Course to the south; Old Fort Weaver Road and (new) Fort Weaver Road to the east; and Farrington Highway to the north. There are two out-parcels along Farrington Highway. One out-parcel of land near the planned University of Hawai'i West O'ahu (UHWO) campus and North-South Road is proposed for multi-family residential use by the Housing and Community Development Corporation of Hawaii (HCDCH). The other out-parcel of land is used by the City and County of Honolulu Board of Water Supply (BWS).

Parcel D1 is located east of the other four parcels and Fort Weaver Road. Pearl Harbor National Wildlife Refuge is located to the north, West Loch Estates is located to the northwest, 'Ewa by Gentry is located to the south and southwest, and Waipahu and Pearl Harbor are located to the east.

Parcel D2 functions as an outlet, connecting Parcel D1 to Pearl Harbor and its use would require approval from the United States Navy.

Parcels E1, E2 and E3 are located north (mauka) of the H-1 Freeway. The parcels are numbered from west to east, with E1 on the west and E3 on the east. All are surrounded by open space, and are connected to Parcel F via narrow parcel of land which will serve as a waterline.

Parcel F is located north (mauka) near to the H-1 Freeway. It is linked to Parcels E1, E2 and E3 by a narrow band of land. It is bordered by the H-1 Freeway on the southern boundary and by open space on its north, east and western sides.

Parcel G is adjacent to the makai boundary of Parcel C and is located north (mauka) of the 'Ewa Villages Golf Course, and is already located within the State Urban Land Use District boundaries.

Adjacent landowners to the Project Area, from a regional perspective, are identified in Figure 2.2: Surrounding Land Ownership.

2.1.4 Description of the Project Area

The Project Area has been used primarily for agricultural purposes. The Project Area was previously leased to the 'Ewa Plantation Company/'Ewa Sugar Company and the O'ahu Sugar Company. The Project Area's current tenants and existing land uses are listed in Table 2.1 below and shown on Figure 2.3: Current Lessees.

Rocker G. Livestock (d.b.a. Bud Gibson)	Pasturage
Larry G. Jefts	Diversified agriculture, ranching and grazing of cattle
Garst Seed Company	Cultivation of legal seed corn and other agricultural crops
Roberts Hawaii School Bus, Inc.	Parking of no more than 30 school buses and 60 Handi-Vans
Hawaii Agricultural Research Center	Agricultural research station

2.1.5 State Land Use District

The Petition Area is currently in the State Agricultural District (See Figure 2.4: State Land Use District). Lands outside of the Petition Area are located within the Urban and Agricultural Districts. D.R. Horton filed a petition (A06-771) with the State Land Use Commission to reclassify the Petition Area to the Urban district.

2.1.6 Ewa Development Plan

The *Ewa Development Plan* designates the Petition Area as Low and Medium Density Residential, High Density Residential, Agricultural Land Preservation, Parks, and Transit Node (High Density Residential and Commercial) and Future Intermediate School (See Figure 2.5: Ewa Development Plan and Figure 2.6: Ewa Development Plan Open Space Map).

2.1.7 City and County of Honolulu Zoning

The Petition Area is presently zoned AG-1 Restricted Agricultural District by the City and County of Honolulu's Land Use Ordinance (See Figure 2.7: Current Zoning Map). As such, the Petitioner will be seeking a Zone Change for the 1,553.844 acre Petition Area, and the 1.301 acre Parcel G [TMK: 9-1-17: 04 (por.)].

2.2 STATEMENT OF PURPOSE AND NEED

According to the City and County of Honolulu Department of Planning and Permitting (DPP), the year 2006 population of the *Ewa Development Plan Area* (Ewa DPA) was 86,000 (DPP, 2006). This comprised an increase of 25.1 percent from its 2000 population of 68,718. The DPP expects the population of the Ewa DPA to increase to 180,200 by the

AR00027055

year 2030. In comparison, the population for the City and County of Honolulu as a whole increased only 3.8 percent from 876,156 to 909,863 between 2000 and 2006. The City and County of Honolulu is expected to experience a population growth of 27.5 percent (241,144 persons) from 876,156 to 1,117,300 total residents during the same 30-year period.

With the expected increase in population, most of O'ahu's new housing stock is planned for development in the 'Ewa and Central O'ahu regions. Indeed 'Ewa is the City and County of Honolulu's lone "Development Plan" area. This trend is expected to continue over the next several decades to accommodate the projected population growth and housing demand. Large-scale housing development projects in the 'Ewa region provide an opportunity for fee-simple home ownership at relatively affordable prices.

The Ho'opili community will provide numerous socio-economic opportunities to residents of Hawai'i. Development of the Petition Area would include development of a mixed-use, transit-ready community including residential, business, and commercial units; and transit stations, schools, and parks. As such, Ho'opili aims to provide: employment centers; quality schools; shopping, gathering and recreational places; and parks and open space for residents; and diverse, including affordable, housing options. Residents will live, work, learn, play, and shop in one area. In addition, the project will generate direct and indirect jobs during construction and post-construction, and enable residents to live, work, learn, play, and shop in one area.

2.3 THE VISION

Ho'opili – which means "coming together" in Hawaiian – reflects the ideas, hopes and dreams of what the community envisioned during the planning and preliminary design phases of the project. The plan envisions vibrant and safe neighborhoods where people feel a sense of connection with one another, and with the rest of O'ahu.

Ho'opili reflects the public's desire for a community that provides: affordable living options; employment centers; quality schools; shopping, gathering and recreational places; and parks and open space for residents, thus allowing community residents the ability to live, work, learn, play, and shop in one area. In addition, Ho'opili will incorporate green building practices and to be an environmentally-sound, healthy and resource-efficient community.

To achieve the vision for Ho'opili, a Conceptual Land Use Plan (See Section 2.5.1) has been formulated that illustrates a mixed-use community that would complete and connect 'Ewa with the surrounding communities. Originating from the common vision and values of a community-driven planning effort, the conceptual plan contains a series of neighborhoods with a mix of uses including residential, retail, office and light industrial. Included in this mix are a series of parks, schools, public buildings and community centers which act as a focus and help define the identity of each neighborhood.

2.4 THE COMMUNITY PLANNING PROCESS

Representatives from various West O'ahu community groups began work on formulating a vision and master plan for a new West O'ahu community being planned by D.R. Horton in October 2005. The group, the Ho'opili Community Task Force, met nearly once a month – and sometimes more often – for a year (October 13, 2005; November 9, 2006; February 1, 2006; March 1, 2006; March 29, 2006; April 17, 2006; May 15, 2006; June 5, 2006; June 26, 2006; August 14, 2006; and October 16, 2006), to explore the communities' needs and desires for the completion of the 'Ewa Vision on topics such as "gathering place," "parks and community facilities," "transportation and infrastructure," "education," "employment," and "housing." After the completion of the master plan, the Ho'opili Community Task Force has continued to meet (March 5, 2007; April 2, 2007; May 7, 2007; June 4, 2007; June 25, 2007; July 16, 2007; August 6, 2007; September 17, 2007; and October 15, 2007) to address the most challenging issue of the region, traffic, especially daily commuting to workplaces and schools outside of the 'Ewa region. The group will be asked to reconvene in early 2008 to continue its work on the plan and anticipated development issues.

The planning effort produced a community-driven vision for a new kind of development, one that improves the quality of people's lives by allowing them to live, work, learn, shop and play – all right in their own community.

The proposed plan for Ho'opili hopes and dreams of what the community wanted to see in this new community. The plan reflects the community's desire for vibrant and safe neighborhoods where people feel a sense of connection with one another, and with the rest of O'ahu.

The Conceptual Land Use Plan also reflects the desire for a community that provides: affordable living options; employment centers; quality schools; shopping, gathering and recreational places; and parks and open space for residents.

Finally, the community expressed a desire to see this new community incorporate green building practices and to be an environmentally-sound, healthy and resource-efficient community.

The Ho'opili Community Task Force identified three core values for its vision for 'Ewa:

- **Connected community**
  - Connects the City of Kapolei with the surrounding communities of 'Ewa, 'Ewa Beach, 'Ewa Villages, Honouliuli, Kalaeloa, Kunia, Makakilo, Waipahu, West Loch, and the rest of O'ahu
  - Make it easy for residents to connect to local shops, parks, schools, employment areas, such as the City of Kapolei and the planned

AR00027061

University of Hawai'i at West O'ahu through a walkable, transit-oriented community with pedestrian/bicycle paths
- Acknowledge the transportation issues in 'Ewa, and provide a thoughtful and real response to these issues
- Use technology to connect businesses and residents with others to create a healthy "live-work" environment

- **Lifestyle-enhanced community**
  - Create a healthy, balanced and vibrant community that offers a unique urban lifestyle in a "village" setting
  - Provide a wide diversity of housing, including truly "attainable" housing
  - Create a "gateway" to West O'ahu that establishes a strong sense of place and a warm sense of community, both for this generation and the next
  - Plan for schools of every type: public and private; daycare through bachelor's degree; and life-long learning opportunities
  - Provide more quality jobs so people can live, work and thrive in their own community
  - Provide a gathering place that creates a real community "center" and gives residents "somewhere to go"

- **Sustainable "green" community**
  - Incorporate green building practices and an environmentally-sound, healthy and resource-efficient community
  - Provide lots of parks, open space and community facilities
  - Plan for and properly-phase utility infrastructure
  - Reduce automobile dependency by creating a compact community with a mix of land uses
  - Preserve views to Diamond Head and surrounding mountains

The Ho'opili Community Task Force's vision and values manifested itself in the following proposed land uses for a mixed-use community:

Variety of Parks and Open Space. Various large and small parks are planned throughout Ho'opili. These include:

- A District Park with active playfields
- Canyon Park (a unique "wilderness"-type park)
- Civic Plaza - a community gathering space for outdoor concerts, farmer's markets, et cetera.
- "Mini" parks, located throughout the project to be within walking distance of most residences
- Linear parks and open space that encircle Ho'opili with walking/biking paths

AR00027062

Various Community Gathering Spaces. Ho'opili is planned to provide a number of gathering places including the Civic Plaza, the various parks, a community center, houses of worship and new public school cafetoriums that can be used for community meetings, et cetera.

Wide Range of Educational Facilities. A range of educational facilities are planned for Ho'opili residents, either on-site or nearby. Possible schools include daycare and/or pre-school facilities, public elementary schools, a public middle school, and a public high school, and possibly private schools. Ho'opili will also be designed to connect with the new UH West O'ahu campus. Providing such facilities in Ho'opili will help reduce trips outside of 'Ewa.

Diverse Career Opportunities. Through 2025, it is expected that more than 40,000 new jobs will be created in the 'Ewa region and Kapolei. While many of its residents might fill these jobs, Ho'opili is designed to be a well-balanced community, hoping to allow residents the opportunity to integrate their personal and professional lives by offering a number of new employment alternatives. The Petitioner hopes to help attract new employers to the area in its goal to achieve a jobs-housing balance to help reduce the need for commuting outside of 'Ewa. At full build out, Petition Area employment is expected to account for approximately 1,550 jobs. Possible jobs-creation areas include research and development parks associated with UH West O'ahu, medical offices that will complement Hawai'i Medical Center West and Kahi Mohala, schools, offices, restaurants and retail. As at Mehana, in the City of Kapolei, Ho'opili will include "live-work" units where residents can own homes that also serve as business locations. Off-site, but within 'Ewa, career-type opportunities include those at the City of Kapolei, Ko 'Olina and UH West O'ahu.

Various Home Choices. Ho'opili is planned to feature a variety of housing options, including: low-density residential, including single-family homes; medium-density (including "live-work" housing featuring townhouses and semi-attached homes); and higher-density residential condominiums and apartments.

Shopping, Dining and Entertainment Choices. Ho'opili is planned to include shopping, dining and entertainment establishments concentrated within walking distances of the Civic Plaza, medium and higher density residential areas, offices and the planned high-capacity transit stop. These establishments should add to the social opportunities within 'Ewa and reduce the need to drive to "town" for shopping, dining and movies.

Multi-Modal Transportation. Ho'opili is designed to be bus/high-capacity transit-ready with a vast, interconnected internal street grid that provides numerous ways of getting around by bus/high-capacity transit, on foot, by bicycle, and by car (See Figure 2.8: Proposed Circulation Plan).

AR00027063

Pedestrian-Friendly Environment. Ho'opili is planned to include a comprehensive pedestrian/bicycle system that connects homes to schools, gathering places, community facilities, parks and open spaces. Also, Ho'opili's proposed mix of land uses should mean that jobs, goods and services that residents need (including day care), will be either just "steps away" or a "couple of doors down." Reducing automobile dependency can lead to an enhanced lifestyle that encourages healthy living.

2.5 THE HO'OPILI COMMUNITY

2.5.1 Ho'opili Conceptual Land Use Plan

The Proposed Action involves the reclassification of approximately 1,553.844 acres from the Agricultural District to the Urban District. Urbanization of the petition area will enable the Petitioner to develop the proposed Conceptual Land Use Plan (See Figure 2.9: Conceptual Land Use Plan). The proposed Ho'opili Conceptual Land Use Plan will be a community where residents can live, work, learn, play, and shop.

To achieve the communities' vision for Ho'opili, a Conceptual Land Use Plan has been formulated that illustrates a mixed-use community that would complete and connect 'Ewa with the surrounding communities. Originating from the common vision and values of a community-driven planning effort, the conceptual plan contains a series of neighborhoods with a mix of uses including residential, retail, office and light industrial. Included in this mix are a series of parks, schools, public buildings and community centers which act as a focus and help define the identity of each neighborhood.

Ho'opili is planned to be connected to the surrounding 'Ewa District (and neighboring DHHL, UHWO and HCDA properties) by a network of streets and bicycle paths which should allow a variety of circulation options for residents and visitors. Wider tree-lined boulevards are intended to create a distinct axis running north-south and east-west across the site. Ho'opili is being designed to be transit-ready, and the land use plan, while subject to change, has been designed to accommodate a high-capacity transit corridor either along Farrington Highway or diagonally through the project site, with either one or two transit station locations. Also possible is a transit maintenance and storage facility. While the proposed residential unit count should not materially change, it will need to be adjusted depending on the final alignment of the high-capacity transit corridor, as ridership generation, "capture" of transit-oriented development potential and the potential for noise impact from an elevated high-capacity transit alignment would likely require taller, higher density residential or industrial uses along the alignment. The final siting of the transit station location(s) will concentrate higher intensity development (and density) around the transit station(s). A site for a transit maintenance and storage facility is also possible. (As of this writing, the City and County of Honolulu has begun work on the Draft EIS for the Honolulu High-Capacity Transit Corridor (HHCTC) project, with a target publication date in the second quarter of 2008. By the time the HHCTC Draft EIS is

published, the final alignment of the high-capacity transit corridor, the location of transit stations, and the location of the transit maintenance and storage facility will be known).

In the geographical center of the site there is a public square or Civic Plaza that is surrounded by higher density housing development and mixed-use buildings. Housing intensity transitions to lower-density small-lot single-family homes along the eastern and southern peripheries of the site. A significant open space and pedestrian/bicycle trail network provides a wide variety of recreational opportunities for residents and other members of the 'Ewa community. Ho'opili will incorporate traditional Hawaiian building styles with a modern, contemporary aesthetic and will reflect the landscape and climate.

The general land use allocation illustrated on the Conceptual Land Use Plan is summarized in Table 2.2 and described below:

Low-Medium Density Residential/Live-Work
Ranging from traditional single-family detached homes on varying lot sizes to multi-family dwellings with a variety of live-work opportunities, there are approximately 535 gross acres (which includes secondary roads and mini-"neighborhood" parks) planned to accommodate approximately 5,100 residential units at densities of 5 to 14 units per acre. These areas would include mini-parks located as focal points and activity centers of the community.

Mixed-Use/Medium Density Residential
Planned to be oriented along future high-capacity transit and major roadway alignments, these medium density mixed use districts would include live-work residential units or residential uses over ground floor commercial and office uses. Within these districts that comprise approximately 340 acres (all of which will not be developed for housing because the acreage includes secondary roads, off-street parking and mini-"neighborhood" parks), there are approximately 5,200 dwelling units planned at densities of 15 to 29 units per acre along with retail and office use.

Mixed-Use/High Density Residential
Planned to be located near major transportation junctions, these higher density mixed use districts would include commercial, office space, and higher density live-work residential units or residential uses above ground floor businesses. Within these districts that comprise approximately 50 gross acres (which includes secondary roads, off-street parking and mini-"neighborhood" parks) would be approximately 40 net developable acres that would accommodate approximately 1,450 dwelling units planned at densities of 30 to 50 units per acre along with retail and office use.

Business / Commercial
To serve the neighborhoods and surrounding communities and to provide a variety of employment opportunities within Ho'opili, the business/commercial uses are located to be conveniently accessed from the major transportation corridors of the region. The

AR00027067

approximately 145 gross acres illustrated (which includes secondary roads and off-street parking) are estimated to yield a net development area of approximately 130 acres that are projected to accommodate retail and office use. These areas would be significant employment generators for Ho'opili and the region.

Light Industrial / Business Mixed-Use
To meet regional demands and to provide for an additional employment center for Ho'opili, approximately 50 gross acres (which includes secondary roads and off-street parking) are planned to provide an area for larger light industrial type users and businesses. It is estimated that there would be a net development area of approximately 40 acres industrial mixed-use.

Open Spaces / Buffers
Integral to the connectivity of Ho'opili to the surrounding neighborhoods, a variety of open space buffers and drainage detention areas are planned. Some of the key open space buffers include along the H-1 Freeway, Honouliuli Gulch and along Old Fort Weaver Road.

Parks
Some of the key parks being planned include a district park along Fort Weaver Road and a downtown civic square to serve as the community gathering area.

Mini-Parks
Integral to the establishment and identity of neighborhoods, a variety of smaller parks of approximately one to two acres in size are planned. Properly planned and located, most residents will be within walking distance of one of these mini-parks.

Public Facilities
The proposed project could include as many as five public school sites. The Conceptual Land Use Plan shows the possible locations for five State Department of Education (DOE) school sites planned to be as accessible to the neighborhoods of Ho'opili as the community is developed; one high school, one middle school and three elementary schools. The plan can also accommodate private schools as the need is determined. In addition, area is set aside along the western end of Farrington Highway fronting the Petition Area for either a fire station or a police substation. In total, approximately 100 acres are allocated to meet public facility needs. The master plan will likely be adjusted prior to zoning to achieve DOE-desired public school campus site configurations.

Major Roads and the Honolulu High-Capacity Transit Corridor (HHCTC) Project
To provide for improved regional circulation and to define and serve the various neighborhoods of Ho'opili, the major boulevards planned within the community are illustrated. In addition, there will be a well planned network of local streets to provide connectivity and alternate routes throughout the community in a safe and pedestrian friendly manner. This land use category includes the portion of the property that will be

AR00027068

utilized for 1) the widening of Farrington Highway fronting the Petition Area, 2) a portion of North-South Road between Farrington Highway and Kapolei Parkway, 3) portions of the intersections of North-South Road with Farrington Highway and the H-1 Freeway, and 4) the segment of the East-West Connector through the Petition Area. As previously mentioned, a portion of the project site may be taken for a segment of the HHCTC project, including a possible transit maintenance and storage facility.

Proposed land uses are shown in the Conceptual Land Use Plan (See Figure 2.9: Conceptual Land Use Plan) and generally described below. The approximate land use areas may be adjusted as the proposed Ho'opili Conceptual Land Use Plan is refined through the land use review and approval process, as well as when the HHCTC alignment is finalized within Ho'opili. During the EISPN public review period, the City and County of Honolulu's Department of Design and Construction recommended that "the developer meet with City officials from the Department of Planning and Permitting, Department of Design and Construction, and Department of Parks and Recreation (DPR) at an early stage in the development's planning process to develop a conceptual plan for overall development which is acceptable and appropriate." As such, the Petitioner will continue to coordinate with City and County of Honolulu agencies to develop a conceptual plan for overall development which is acceptable and appropriate.

AR00027069

Table 2.2. Conceptual Land Use Plan – Land Use Summary for Petition Area

LAND USE	APPROX. GROSS ACREAGE	APPROX. DEVELOPABLE NET ACRES	APPROX. NUMBER OF UNITS	GENERAL LAND USE DENSITY RANGE (DWELLINGS/UNITS PER ACRE)	PROPOSED ZONING DISTRICT****
PETITION AREA					
Low-Medium Density Residential/Live-Work*	535	400-475	5,100	5-14	R-5/AMX-2
Mixed Use/Medium Density Residential*	340	250-300	5,200	15-29	AMX-3
Mixed Use/High Density Residential*	50	40	1,450	30-50	BMX-3

Major Roads (as shown)**	124	N/A	-	-	Varies
TOTAL (approx.)	**1,554*** **	**-**	**11,750**	**-**	**-**
* - Mini-"Neighborhood" parks and secondary roadways included in residential areas					
** - May increase as developable areas decrease in residential and commercial categories					
*** - Total acreage to be rezoned is approximately 1,555.145 acres					
**** - Zoning designation may vary depending whether a Transit-Oriented Development overlay district is adopted					
***** - If a transit maintenance yard is sited within the Petition Area, it is assumed that it would fall in the Land Use Ordinance (LUO) land use category of "Public uses and structures." Public uses and structures are defined in the LUO as "uses conducted by or structures owned or managed by the federal government, the State of Hawaii, or the city to fulfill a governmental function, activity or service for public benefit and in accordance with public policy...Typical public uses and structures include: libraries, baseyards...). Once the HHCTC DEIS is published, the location of the transit maintenance yard will be known, and if required, the conceptual land use plan for Ho'opili will be updated.					

2.6 INFRASTRUCTURE IMPROVEMENTS

In support of the Project, infrastructure facilities to be installed, expanded or improved include access and circulation roadways, drainage systems, water and wastewater collection lines, and electrical/communication systems. All infrastructure improvements will be designed and sized to accommodate the project, and for possible future dedication and acceptance by the appropriate agencies. One or more of the proposed infrastructure and utility improvements may require the use of State and/or county road right-of-ways or other lands. Project construction will commence with development of the infrastructure upon issuance of the necessary grading permits.

AR00027070

Major on-site infrastructure improvements required for the project include: facilities for water transmission and distribution; wastewater collection; traffic circulation; drainage; and electrical and communication systems. It is possible that one or more micro-utility companies may be providing a portion or all of the electrical and/or communication systems for the project. For instance, there are companies that can install solar photovoltaic panels on buildings for free in return for charging lower electrical rates than HECO. While the specific nature of each improvement is not known at this time, the EIS is intended to address all current and future instances involving the use of State and/or County lands and funds relating to the Ho'opili project, including micro-utility companies that may require the use over State and/or County lands to operate and maintain any utility lines or facilities. Per comments made by the State Department of Transportation during the Draft EIS public review period, drainage systems, other project construction plans and work affecting the highway right-of-ways require prior DOT review and approval.

It should be noted that the project has been designed to accommodate long-planned regional transportation improvements to be constructed by others including: a portion of North-South Road and its intersections, the future widening of Farrington Highway, and a portion of the HHCTC alignment).

Typically developers will set aside land for and/or build facilities that are designed to meet County standards, such as roads, water storage facilities and transmission lines, sewer collection lines and parks, schools, et cetera, and typically these are dedicated to the appropriate State or County agency to operate and maintain. At Ho'opili, it is possible that community associations, businesses, other private entities or a separate authority, will be accepting the liability, security, operations and maintenance responsibilities for some facilities such as roads, parks, transit stations, et cetera.

2.7 DEVELOPMENT TIMETABLE AND PRELIMINARY COSTS

The following Table 2.3 is a list of major permits and approvals required for the implementation of the proposed Ho'opili Conceptual Land Use Plan.

AR00027071

Table 2.3. Required Permits/Approvals

PERMIT/APPROVAL	APPROVING AUTHORITY	STATUS	PROJECT SUBMITTAL DATE
State Land Use District Boundary Amendment (with EIS)	State of Hawai'i Land Use Commission	Petition has been filed; processing on hold until EIS process has been completed.	First Quarter 2007
Zone Change	City and County of Honolulu Department of Planning and Permitting/City Council	Application to be filed assuming successful processing of SLUDBA.	Third Quarter 2009
Large Lot Subdivision ~~Approval~~ Action	City and County of Honolulu Department of Planning and Permitting	Application to be submitted after change the Zone Change application is approved.	Third Quarter 2010
National Pollutant Discharge Elimination System (NPDES) Permit	State of Hawai'i Department of Health	Application to be submitted prior to Building/Grading Permits.	2011
Building/Grading Permits	City and County of Honolulu Department of Planning and Permitting	Application to be filed after the Zone Change application is approved.	2011
Water Use Permit	State of Hawai'i Department of Land and Natural Resources, Commission on Water Resource Management	Application to be submitted prior to Building/Grading Permits	2011

AR00027072

The Petitioner estimates that the development of the Ho'opili project (major off-site and on-site infrastructure improvements including grading, drainage, sewer, safe-drinking water, non-potable water, roadways, landscaping and improvements to Farrington Highway and North-South Road for access) will cost approximately $4.6 billion (in Year 2007 dollars), spent over the project timeline of 2009 – 2030. During the public review period, both the Land Use Commission and the State Office of Planning made reference to subsection 15-15-50, Hawaii Administrative Rules (HAR). Subsection 15-15-50, HAR identifies the form and contents of a petition to the State Land Use Commission to amend the State Land Use District Boundaries, including representing "…that development of the subject property in accordance with the demonstrated need therefore will be accomplished before ten years after the date of commission approval. In the event full urban development cannot substantially be completed within such period, the petitioner shall also submit a schedule for development of the total of such project in increments together with a map identifying the location of each increment, each such increment to be completed within no more than a ten-year period." The construction of Ho'opili's development will be a challenging process that will require ongoing coordination between many fundamental parts. Infrastructure and road access, neighboring property development, demands of the commercial and housing markets, careful continued agriculture and general property management, and economic viability will all be considered throughout the construction planning process. Furthermore, the City and County of Honolulu's (City) transit project, the largest public works endeavor in Hawai'i's history, will within Ho'opili have its longest traverse through privately owned property and further expand development challenges undoubtedly in unprecedented ways. Many of these parts may involve developing different areas of the project site within the same construction timetable as discussed further below:

Several major development priorities include in no particular order:

- **Water Service from the North.** Both of Ho'opili's main potable water storage and transmission systems will reside mauka of H-1. Considerable investment will be required in the construction of tanks and transmission lines that will ultimately service two water zones within Ho'opili that roughly divide the site between northern and southern halves. (Necessary offsite utility easements have already been secured at a price.) Nonpotable water will be sourced from the reclamation operations at the Honouliuli Wastewater Treatment Plant (WWTP), meaning it will be delivered to Ho'opili from the opposite end from where its potable source will come. Preliminary budgetary construction cost estimates range from between $35 million to $40 million with another $20 million possible from BWS for service connections.

AR00027073

- **Sewer Service from the South.** Unlike Ho'opili's main water system, sewer service will come from the southern end of the property. The first of what is expected to be several Joint Development Agreements (JDA) to secure and construct wastewater transmission is in place with DHHL, UHWO, DLNR and the City and funded. Indeed, the DOT has already constructed this line as part of the North-South Road Phase 1A contract. Discussions are expected to commence later this year in earnest on separate JDAs for two additional segments. Nearly $2 million has already been invested to date, preliminary budgetary costs estimates for these two JDAs range from $10 million to $15 million to stub service at the property's southwestern border, $5 million to $10 million to route through to the mauka area and as much as another $60 million for the City's Department of Environmental Services uses connection charges.

- **Balancing Spread out Access, Initial Infrastructure Needs and Cash Flows.** Today, Ho'opili's lands along the Farrington Highway corridor, its northernmost boundary, present Ho'opili's easiest access for construction purposes and future occupants. Once DHHL completes its section of the East-West Connector Road and the State DOT completes the North-South Road (both now under construction), Ho'opili will have construction and occupant access open at its southern and westernmost locations. This is significant because while available for development today, the Farrington Highway corridor is expected to present some of Ho'opili's greatest development challenges, predominantly the distance sewer lines will have to run through undeveloped land for service, as well as timing development to the City's planned improvements to Farrington Highway itself. Thus, the Petitioner will look to mobilize on these other areas as early as practicable. Nonetheless, there are several key commercial parcels in this Farrington Highway corridor that will need to be among the earliest to be marketed in order to generate cash flow to support needed upfront utility (such as water and sewer as detailed above) and road infrastructure throughout Ho'opili. As a result, development should be started in more than one area from the onset. Over the build-out of the project, it is expected that as much as $50 million to $60 million could be spent on drainage systems and hundreds of millions will be invested in roadway systems servicing the project.

- **Balancing Job Generation, Appropriate Initial Housing Deliveries and Transit**. The majority of the employment areas within Ho'opili are within the Farrington Highway corridor to the north of the property, while the residential development areas that could be most sensible to develop first – the single-family areas – are to the south. Starting housing construction there could generally preserve higher density development in the areas in and around the transit corridor to the north to be better staged with transit's completion and more appropriately address the various demands it will create.

AR00027074

- **Managing Agricultural Operations.** As lands are moved into development over time, consideration will have to be given to the significant challenges of maintaining a working agricultural water system and providing ongoing and unencumbered vehicular access to crop areas. This will be no small task, as it will be the objective of the Petitioner to keep active farms onsite as long as practicable.

As previously stated the development is expected to occur over approximately 20 years. This area of 'Ewa has long been planned for development (Kapolei Area Long Range Master Plan and Ewa Development Plan).

There are several major transportation projects that have been planned for 'Ewa. The Ho'opili project has been planned assuming that certain planned transportation projects will be constructed including a portion of North-South Road between Farrington Highway and Kapolei Parkway; a portion of the North-South Road and a new H-1 Freeway interchange; a portion of the intersection of North-South Road and Farrington Highway; the long-planned widening of Farrington Highway fronting Ho'opili; the proposed East-West Connector Road through the Petition Area; and the first segment of the proposed Honolulu High-Capacity Transit Corridor project through the Petition Area. As major off-site infrastructure (water, sewer, drainage, electrical and communications) would likely occur in most of the above major road right-of-ways, and the exact timing of the completion of these transportation improvements undetermined, it is difficult for the Petitioner to provide a map identifying the phasing of the proposed action in 10 year increments with any degree of certainty. While the phasing of development may be more relevant where there is little or no development, 'Ewa has rapidly developed in recent years and proposed transportation improvements are indicative of State and County assumptions that this portion of 'Ewa would be eventually developed.

2.8 SUSTAINABLE BUILDING DESIGN

Sustainability options are being considered for the Ho'opili project. Where feasible, project buildings, activities, and site grounds are intended to be designed with energy-saving considerations. Given the natural climate, the project may be suited for the use of renewable energy technologies including photovoltaics. During the public review period, the Office of Hawaiian Affairs wrote: "...OHA recommends the use of not only photovoltaic cells but also small wind harvesting electrical generation for peripheral uses such as parking lot lighting."

According to the American Wind Energy Association, small wind energy systems typically range from $3,000 to $5,000 for every kW (kilowatt) of generating capacity, or about $40,000 for a 10 kW system (installed). According to the Hawaiian Electric Company (HECO), wind generation energy resources typically cost approximately $.08 to $.11/kW per hour, however these rates apply to larger wind systems (wind farms) as opposed to individual wind systems whose rates are not readily available by HECO.

AR00027075

Photovoltaic (PV) systems range in price from $8,250 for a one-kW system to more than $40,000 for a five-kW system. According to HECO, internal estimates for photovoltaic (PV) energy resources typically cost approximately $.30 to $.40/kW per hour.

The average energy consumption by a single-family residence in Hawai'i is approximately 600 kW per hour. According to HECO, "Non-firm sources, such as wind and solar, are called "as-available" resources and must be backed up by firm generation to ensure electricity is available when customers need it -- 24 hours a day, regardless of whether the wind is blowing or the sun is shining."

"In addition to not being available 24-hours-a-day, the variability of wind, typical of the trade winds in Hawaii, can cause power problems. It can affect the quality of power produced. Today, a lot of sensitive electronic equipment can be damaged or disrupted by the variability of power produced from sources like the wind. These fluctuations can also place a big strain on the utility's fossil fuel generators if they have to kick in and meet the demand for electricity when the wind power is suddenly not available."

Even when "as-available" resources are available, HECO still needs to cut back on "as-available" renewable energy sources during off-peak periods of electricity use. This is due to scenarios where customer demand for power drops too low, generation must be turned off to cut back on power production. Otherwise, the electric system could potentially overload and become unstable. Furthermore, fossil-fuel generation can only be reduced so much. This on-and-off cycling could lead to damage and accelerated deterioration of fossil-fuel generators. It also causes the generators to burn more fuel than necessary which leads to an increased cost of electricity.

In June 2008, Governor Lingle signed SB 644 which requires that solar water heaters be required before issuance of a building permit on or after January 2010 for single-family residences.

In addition, based on the Department of Business, Economic Development & Tourism (DBEDT), Strategic Industries Division's recommendations, Ho'opili's mechanical and electrical consultants, in consultation with its sustainability consultant, will be directed to review the City and County of Honolulu's Energy Code early in the project and to consult with Hawaiian Electric Company, Inc. (HECO) on demand-side management programs that offer rebates for installation of energy-efficient technologies.

AR00027076

3.0

Assessment of the Natural Environment, Potential Impacts, & Mitigation Measures

3.0 ASSESSMENT OF THE NATURAL ENVIRONMENT, POTENTIAL IMPACTS, AND MITIGATION MEASURES

This section describes the existing natural environment associated with the Petition Area and the project's potential impacts that may result from proposed development. Mitigation measures are proposed to address the project's potential project impacts.

3.1 CLIMATE

Existing Conditions

Average annual daily minimum and maximum temperatures in the Petition Area are 65 and 84 degrees Fahrenheit, respectively. The annual prevailing wind direction for this area of O'ahu is east northeast, about 40 percent of the time, at approximately 10 knots (12 miles per hour). The 'Ewa Plain experiences light rainfall, with a mean annual precipitation of about 20 inches per year, most of which occurs between the months of November and April.

Anticipated Impacts and Mitigation Measures

The project is not expected to have an impact on regional climate. With project build-out, there may be some localized increase in temperature as a result of paved surfaces and roofs. However, shade trees will be incorporated into project landscaping and necessary irrigation will help mitigate any localized temperature increases from roadways, walkways, and buildings.

3.2 TOPOGRAPHY

Existing Conditions

The island of O'ahu was built by the extrusion of basalt and basaltic lava from two shield volcanoes, Wai'anae and Ko'olau. The Petition Area is located on the southwestern flank of the Wai'anae Volcano. A sedimentary wedge, formed by eroded sediment and coral and algae, is located in the Petition Area and to the south. This wedge forms the 'Ewa Plain and serves as the "caprock" over the Southern O'ahu Basal Aquifer (SOBA).

The approximately 1,600.265-acre Project Area consists of 10 distinct parcels of land (See Figure 1.5: Parcels Map). Parcels A, B, C, D1, D2 and G are situated makai of the H-1 Freeway while Parcels E1, E2, E3 and F are situated mauka of the H-1 Freeway. The topography of each of the 10 parcels is described below.

AR00027078

The topography of Parcel A ranges from approximately 150 feet above mean sea level (MSL) at Farrington Highway to approximately 210 feet MSL at the H-1 Freeway. The slope of Parcel A is 3 percent.

The topography of Parcel B ranges from approximately 170 feet MSL at the southwestern boundary (at Farrington Highway) to approximately 205 feet MSL at its northwestern boundary (at the H-1 Freeway). The topography of Parcel B at the southeastern boundary (at Farrington Highway) is approximately 75 feet MSL and approximately 175 feet MSL at the northeastern boundary (at the H-1 Freeway). The slope of Parcel B is between 1.9 percent and 3.2 percent.

The topography of Parcel C ranges from approximately 65 feet MSL at its southern boundary to approximately 175 feet MSL at Farrington Highway. The slope of Parcel C is 1.4 percent. A ravine and steep, east-facing slope are located on the eastern boundary of the Parcel C, along Old Fort Weaver Road.

The topography of Parcel D1 ranges from approximately 10 feet MSL at its northern boundary to approximately 40 feet MSL at its northern boundary. The central portion of Parcel D1 is 25 feet MSL. The slope of Parcel D1 is 1.2 percent. Parcel D2 ranges from 0 feet at its northern boundary to 35 feet MSL at its southern boundary with a slope of 1.1 percent.

The topography of Parcels E1, E2 and E3 ranges from approximately 410 feet MSL at their southern boundaries to 415, 430 and 415, respectively at their northern boundaries. The slope of parcel E1 is 2.8 percent, the slope of E2 is 3.5 percent, and the slope of E3 is 3.9 percent.

The topography of Parcel F runs with an east-west slope with an elevation of 240 feet MSL on the western boundary and an elevation of 205 on the eastern edge. The center of the parcel is at an elevation of 220 feet. Parcel F has a slope of 3.49 percent on the east-west axis.

Parcel G is very small and located along the makai edge of Parcel C, bordering the 'Ewa Villages Golf Course. The slope of Parcel G is approximately 1.4 percent.

The entire Petition Area has been historically utilized for sugarcane cultivation and large portions are currently utilized for agricultural production. As such, the Petition Area has been extensively modified with dirt roadways, various irrigation systems, and other appurtenant agricultural structures.

AR00027079

Anticipated Impacts and Mitigation Measures

The topography of the Petition Area is mostly gently sloping (and highly accessible) and provides adequate slope for drainage. The Petition Area will be modified with infrastructure improvements and urban structures for residential, commercial, industrial, recreational and educational uses. The Petition Area will include drainage detention basins, open space buffers, parks and some undeveloped areas. Most of the developed areas will be extensively landscaped, which will minimize the potential for soil erosion. Compared to existing conditions in which the land is vacant or used for agricultural production, the proposed drainage system for the Project will provide better control and management of surface runoff during intense storms.

All grading operations will be conducted in accordance with dust, erosion control, and other requirements of the City and County of Honolulu's grading ordinance. All construction activities must comply with the relevant provisions regulating Fugitive Dust set forth under Section 11-60.1-33, HAR. A grading permit is required to modify the topography, and additionally, a National Pollutant Discharge Elimination System (NPDES) permit will be required prior to construction to address non-point source discharges.

3.3 SOILS

Existing Conditions

Three soil suitability studies have been prepared for lands in Hawai'i. The principal focus of these studies is to describe the physical attributes and relative productivity of different land types for agricultural production within the State of Hawai'i. The three studies are the U.S. Department of Agriculture (USDA) *Natural Resources Conservation Service Soil Survey*, the University of Hawai'i Land Study Bureau *Detailed Land Classification*, and the State of Hawai'i Department of Agriculture's *Agricultural Lands of Importance to the State of Hawaii* (ALISH).

Natural Resources Conservation Service Soil Survey. The Petition Area includes several different soil types, as classified by the Natural Resources Conservation Service. Table 3.1 lists these soil types and their potential for erosion.

AR00027080

Table 3.1. Soil Types and Erosion Potential

SOIL TYPE	EROSION POTENTIAL

Waipahu Silty Clay, 6-12% Slopes	Moderate
Wahiawā Silty Clay Loam 0-3% Slopes	Slight

Figure 3.1: Natural Resources Conservation Service Soil Survey shows the distribution of soils within the Petition Area.

Land Study Bureau Detailed Land Classification. The *Detailed Land Classification* (1965 through 1972) series was produced for each island by the Land Study Bureau (LSB) of the University of Hawai'i. The intent of this series of reports was to develop a land inventory and productivity evaluation based on statewide standards of crop yields and levels of management.

A five-class productivity rating is applied using the letters A, B, C, D and E, with A representing the class of highest productivity and E the lowest. Most of the soils within the Petition Area are rated B (See Figure 3.2: Land Study Bureau). Other soils are rated A, with fewer soils rated C, D and E. These soil ratings reflect the Petition Area's past and present use for agricultural production under irrigated conditions.

Agricultural Lands of Importance to the State of Hawaii. *The Agricultural Lands of Importance to the State of Hawaii* (ALISH) (1977) system classifies lands that are important to agriculture in Hawai'i as Prime, Unique, or Other Agricultural Land, with Prime Agricultural Land representing the class of greatest importance and Other Agricultural Land the least. Most of the Petition Area includes soils identified as Prime Agricultural Land, which is defined as "land best suited for the production of food, feed, forage, and fiber crops." The remaining lands are identified as Other Agricultural Land (which is important to agriculture in Hawai'i but exhibits properties that exclude it from the Prime

or Unique Agricultural Land classifications) or are not classified by the ALISH system (See Figure 3.3: Agricultural Lands of Importance to the State of Hawaii).

Anticipated Impacts and Mitigation Measures

During project construction, there is a potential for soil loss through the generation of dust and water-borne soil erosion as areas are graded. All grading operations will be conducted in accordance with dust and erosion control and other requirements of the City and County of Honolulu Grading Ordinance and all applicable provisions regulating Fugitive Dust set forth under Section 11-60.1-33, HAR regarding. A NPDES permit will also be required prior to construction to address construction-related runoff. Additionally, a watering program will be implemented during construction to minimize soil loss through fugitive dust emission. During the public review period, the Department of Health (DOH) Clean Air Branch (CAB) recommended that a dust control management be prepared. The DOH CAB also provided additional examples of measures that can be implemented during construction:

- where possible, for areas involving mixed land uses, buffer zones be established to alleviate potential dust nuisance problems;
- planning the different phases of construction, focusing on minimizing the amount of dust-generating materials and activities, centralizing on-site vehicular traffic routes, and locating potential dust-generating equipment in areas of the least impact;
- providing an adequate water resource and watering program at the site prior to start-up of construction activities;
- landscaping and providing rapid covering of bare areas, including slopes, starting from the initial grading phase;
- minimizing dust from shoulders and access roads;
- providing adequate dust control measures during weekends, after hours, and prior to daily start-up of construction activities; and
- controlling dust from debris being hauled away from the project site.

In addition, during the public review period, the Office of Hawaiian Affairs wrote: OHA recommends cleaning job-site construction equipment and establishing groundcover as quickly as possible after grading with native or endemic drought tolerant species. In addition to landscaping and watering programs, other mitigation measures suggested include:

- Early construction of drainage control features;
- Construction of temporary sediment basins to trap silt, where needed;
- Use of temporary berms and cut-off ditches where needed; and
- Use of temporary silt fences (coir works well) or straw bales to trap silt.

AR00027084

After construction, landscaping and drainage improvements will provide permanent post-construction pollution control measures and minimize the potential for soil erosion. Since much of the Petition Area presently consists of cultivated crops, exposed soil, and scrub vegetation, overall soil loss will likely be reduced significantly after development compared to previous and current conditions in which the land is used for agricultural production.

3.4 AGRICULTURAL IMPACT

Existing Conditions

The approximately 1,553.844 acre Petition Area was cultivated in sugarcane from the late 1800s to 1995. Currently, the majority of the Petition Area is leased or subleased to Aloun Farm, Inc., Fat Law's Farm, Sugarland Farm, Inc. and Syngenta Seeds, Inc. (See Figure 2.3: Current Lessees). These existing leases are listed in Table 2.1 of Section 2.1.4.

An Agricultural Impact Analysis had been prepared by Decision Analysts Hawaii, Inc. and is included as Appendix A. A summary of the studies findings are listed below.

Anticipated Impacts and Mitigation Measures

The creation of the Ho'opili project will require that the approximately 1,553.844 acre Petition Area be withdrawn from agricultural use. The project will result in a direct loss of approximately 1,497 acres of agricultural land being leased for various agricultural operations. This amounts to less than one percent of the approximately 160,000 acres of agricultural land that remain available throughout the State of Hawai'i. On the island of O'ahu, approximately 10,900 acres of agricultural land would remain available in Kunia and the North Shore. During the Draft EIS public review period, the State Department of Agriculture commented that the 1,497 acres of leased agricultural land in the project site is 13.7% of the 10,900 acres of farm land reported to be available on Oahu (3,150 acres in Kunia and 7,750 acres in the North Shore).

The Petition Area is currently in the State Agricultural District (See Figure 2.4: State Land Use District). However, the *Ewa Development Plan* designates the Petition Area as Low and Medium Density Residential, High Density Residential, Agricultural Land Preservation, Parks, and Transit Node (High Density Residential and Commercial) and Future Intermediate School (See Figure 2.5: Ewa Development Plan). D.R. Horton filed a petition (AO6-771) with the State Land Use Commission to reclassify the Petition Area to the Urban District. The petition to reclassify the Petition Area is consistent with the standards for determining boundaries of the Urban District pursuant to Section 15-15-18, HAR.

The Ewa DP and *Kapolei Long Range Master Plan* (See Figure 3.4: Kapolei Area Long Range Master Plan) have long planned for new development in the Petition Area,

AR00027087

including transit, and as such, tenants have been fully aware, for quite some time, that the proposed Petition Area would be used to accommodate future development in the region. The current tenants entered into lease agreements acknowledging the Petitioner's plans for future development. In return, the Petitioner set lease rents and water rates favorable for agricultural operations. In addition, the Petitioner continues to work on the eventual relocation of the largest tenant, Aloun Farm, Inc., to other farm areas in Central O'ahu and the North Shore, even though construction is not expected to start until the final quarter of 2009 at the earliest, with an estimated completion date of 2030.

Since the Petitioner intends to develop the project in phases, it will only withdraw land from the leases on an as-needed basis for construction and development and as provided for in agreements with the individual lessees. Within the Petition Area, lands will gradually be withdrawn from agricultural production for residential, commercial, and educational uses.

Potential temporary nuisance issues related to agricultural cultivation in close proximity to newly built homes could arise as portions of the Ho'opili project are developed. To mitigate these potential impacts, mitigation measures include:

- To the extent possible – and subject to transit alignment, water and other infrastructure improvements – phase the development of homes and coordinate agricultural leases to provide wide separations between homes and upwind agricultural activities.
- For each development phase of Ho'opili and projects on adjoining State land, require agricultural tenants to provide a buffer of fallow fields and berms upwind of the homes before the homes are occupied.
- As necessary, limit agricultural activities (restricted hours of operation, restricted plowing and use of chemicals on windy days, etc.) so as to avoid or minimize nuisance problems.
- Inform home buyers in the area that they will be living near agricultural activities, as long as agricultural activity continues in the area.

Upon full build-out of the Ho'opili project, approximately $6 million per year in revenues, an average of about 80 jobs and $1.7 million per payroll will be displaced from the Petition Area. <u>According to comments received from the State Department of Agriculture during the Draft EIS public review period, "the $6 million in farmgate revenues is about 4.4% of Oahu revenue from sales of all crops (2005 Statistics of Hawaii Agriculture, page 12), or 15.4% of the farmgate value of vegetables and melons produced on Oahu (ibid., page 11). The farm worker employment of 77 people represents about 3.7% of all the farm workers on Oahu (ibid, page 87)."</u> Affected lessees are anticipated to be able to secure replacement lands, therefore, enabling them to maintain prior levels of production, sales revenues, employment and payroll. Should sufficient replacement land not be available on the island of O'ahu, then other options include the relocation of agricultural businesses to Neighbor Islands with available agricultural land.

AR00027088

Agricultural operations may have to adjust for different agronomic conditions in the replacement lands, preparing soils and irrigation systems for specific crops, and moving offices and cooling and packing facilities. Since the affected diversified crop operations can be flexible with regard to their sizes, it is anticipated that they will survive regardless of the amount of replacement land they lease in the future.

The loss of agricultural production from the project and other projects through ought the State of Hawai'i are expected to be offset by:

- Agricultural businesses maintaining their current levels of operation and production by leasing replacement lands in Kunia and/or the North Shore, and possibly cultivating their remaining lands more intensively.
- Agricultural operations relocating all or portions of their operations to a Neighbor Island.
- Other agricultural operations on O'ahu and the Neighbor Islands increasing their production.
- A combination of the three.

As such, statewide agricultural production, revenues, employment or payroll are not anticipated to be adversely affected.

Various mitigation measures recommended to contribute to the successful relocation of affected businesses by the proposed project include: addressing water issues that limit crop production on the North Shore where most available cultivable land lands on O'ahu are located and providing sufficient time to make necessary improvements and arrangements for the relocations. The recommended mitigation measures include:

- Upgrading the Wahiawā Wastewater Treatment Plant (WWTP) to treat wastewater to the State's R-1 standard, or eliminate discharging wastewater into the Wahiawā Reservoir.
- Repair of the Wahiawā Irrigation System (WIS)
- Phase future development projects to maintain agricultural operations in 'Ewa for as long as possible.
- Continue supporting current tenants by providing lands for cultivation at below market rates.
- Continue supporting current tenants by phasing construction to allow agricultural operations as long as possible and to minimize nuisance complaints.

AR00027089

3.5 GROUNDWATER RESOURCES/HYDROLOGY

Existing Conditions

The 'Ewa region of O'ahu overlies the Southern O'ahu Basin Aquifer (SOBA), a designated Sole Source Aquifer. Drinking water supply is drawn from this aquifer in the volcanic formation at depth. According to Tom Nance Water Resource Engineering, the piezometric head of this aquifer, which is inland and directly beneath the Ho'opili site, is about 18 feet above sea level.

The gently sloping topography of the 'Ewa Plain is comprised of terrestrial alluvium, which is made up of clay and mud eroded from volcanic rock. The terrestrial alluvium is inter-layered with coral limestone deposited during periods when the area was covered by the ocean. This geologic feature is commonly referred to as "caprock." The caprock overlies these volcanics to the near vicinity of Farrington Highway. In cross section, the caprock is wedge-shaped. It is about 1,000 feet thick at the shoreline and tapers to just a few tens of feet thick in the vicinity of Farrington Highway. It is comprised primarily of limestone and marl on its seaward half (makai of OR&L Railroad right-of-way) and primarily terrestrial alluvium inland of the OR&L Railroad right-of-way. ~~The caprock is located makai of the H-1 Freeway and is approximately 1,000 feet thick near the shoreline.~~

Brackish to saline basal groundwater exists in the upper limestone layer of the caprock. According to Tom Nance Water Resource Engineering, its water level is 1.0 to 1.5 feet above sea level. It is referred to as the caprock aquifer, but it is not present through the entire caprock formation. It is limited to the upper limestone layer. All water in the caprock formation below the thin lens in the upper limestone layer is saltwater. Water in the caprock is too saline to be used for safe drinking water.

Leakage upward from the higher head, volcanic aquifer into the caprock formation does occur, but according to Tom Nance Water Resource Engineering, it is limited to the inland margin of the caprock. This rate of upward leakage is a function of geology and the piezometric head in the volcanics. It is not influenced by the much lower water level in the upper limestone layer of the caprock.

The current irrigation allocation for the Petition Area is 8.0 million gallons per day (MGD). The average irrigation use is approximately 2.0 to 3.0 million gallons per day (MGD), depending on the time of the year.

The potential for surface water contamination under the caprock is low due to artesian conditions and the relatively impermeable caprock. Infiltration of surface water mauka of the caprock could cause contamination to the safe drinking ground water resource since the caprock is no longer present to function as a barrier in this area. Hydrological modeling predicts that the salinity of the caprock aquifer will increase as fresh water recharge declines with the reduction in sugarcane irrigation.

AR00027090

DOH has established the Underground Injection Control (UIC) line at North Hanson Road (south of the Petition Area). The primary purpose of the UIC line is to protect potential sources of safe drinking water by not allowing wastewater injection wells or cesspools mauka of the line. The Petition Area is situated mauka of the UIC line.

A well-defined stream channel is the only existing hydrological feature within the Petition Area. Honouliuli Stream channel acts as the primary channel for runoff from part of the Petition Area and drainage of the watershed upstream. Runoff waters and discharge waters from the BWS tanks upstream pass through the site in this stream channel. Within the Petition Area, surface water in the channel does not appear to be connected to the groundwater.

The Honouliuli Stream discharges into the Pacific Ocean at West Loch, Pearl Harbor. The mouth of the stream is located at the western border of the West Loch Golf Course. Fishponds, small feeder channels, and tidal flats were observed near the mouth of the stream.

Anticipated Impacts and Mitigation Measures

The total average daily source requirement for ultimate build-out is estimated at 3.9 MGD. The present agricultural use of the Petition Area provides recharge to the alluvial portion of the caprock from excess applied irrigation water. This irrigation return eventually moves into the aquifer in the upper limestone layer of the caprock, becoming a portion of its recharge, albeit a relatively small portion. According to Tom Nance Water Resource Engineering, development of the Ho'opili project will diminish this small component of the recharge to some extent, but will have an immeasurable impact on water level in the upper limestone layer.

The project is not expected to impact groundwater resources, as the caprock acts as a barrier to the drinking water in the Petition Area. The caprock in 'Ewa, around Pearl Harbor, and in Honolulu, does function to retard seawater intrusion into the drinking water aquifer in the volcanics. According to Tom Nance Water Resource Engineering, it is an incredibly important contribution to the availability of drinking water which comes about due to the mostly impermeable contact surface between the volcanics and the overlying caprock. It is not due to the water level in the caprock.

Both the drinking water aquifer in the volcanics and the bracksish to saline aquifer in the caprock's upper limestone layer are in hydraulic contact with seawater nearshore and offshore. Sea level changes, whether weeks or months long due to large scale whether phenomena in the Pacific or a longer term sea level rise, does cause both aquifers to rise or fall accordingly. According to Tom Nance Water Resource Engineering, the Ho'opili project will have no impact on sea level changes.

AR00027091

Although the Petition Area is situated mauka of the UIC line, no injection wells or cesspools will be installed (since the project's wastewater collection system will eventually connect to the Honouliuli Wastewater Treatment Facility), and any runoff or wastewater disposal required for the project will be managed in full compliance with State Department of Health (DOH) regulations. Irrigation for landscaping will utilize brackish water from the 'Ewa caprock and/or treated effluent (R-1 quality) from the City and County of Honolulu's Honouliuli Wastewater Treatment Facility (if available) to facilitate the recharge of caprock water and to reduce the demand for safe drinking water from the BWS system.

Probably like any other region where a directed growth policy is in place. O'ahu has a finite supply of potable quality groundwater, meaning development using additional groundwater will eventually result in the need for desalination. The proposed project is not unique in this regard. BWS has long range plans to develop a desalination plant at the makai end of Campbell Industrial Park to ultimately meet the island's needs.

Regional drainage plans call for storm runoff from Kalo'i Gulch mauka of the H-1 Freeway to be diverted to the east side of North-South Road (planned for completion in 2008), within a portion of the North-South Road right-of-way. Proposed drainage improvements within the Petition Area include on-site detention and retention basins, which will promote on-site infiltration of surface water and facilitate groundwater recharge. Parcel D1 will also be used for off-site drainage. The project will meet storm water quality requirements of the Rules Relating to Storm Drainage Standards through the use of detention basins and structural methods including Stormceptor® type drain manholes.

There are presently no plans for uses within Honouliuli Stream that are expected to require a permit from the U.S. Army Corps of Engineers. Additionally, there are presently no proposed uses expected to obstruct flows within Honouliuli Stream flood hazard zones.

3.6 NATURAL HAZARDS

Existing Conditions

Natural hazards include events such as tsunami, earthquakes, floods, hurricanes, soil slippage, and volcanic hazards. Of these natural hazards, the Petition Area may be subject to hurricanes and earthquakes in the future. However, the Petition Area is not naturally more prone to hurricanes and earthquakes than any other areas on O'ahu.

The Federal Emergency Management Agency (FEMA) classifies flood hazard zones as part of the Flood Insurance Program for the City and County of Honolulu. According to the Flood Insurance Rate Map (FIRM), the majority of lands within the Petition Area are in Zone D (See Figure 3.5: Flood Insurance Rate Map). A very small portion of Parcel C near

AR00027092

Honouliuli Stream is located in Zone AE and Zone X. A portion of Parcel B around Honouliuli Stream is located in Zone A and Zone X. These flood zones are described in Table 3.2 below.

Table 3.2. FIRM Designations

ZONE	DESCRIPTION
A	Areas inundated by 1 percent annual chance flooding, for which no base flood elevations have been determined
AE	Areas inundated by 1 percent annual chance flooding, for which base flood elevations have been determined
X	Areas outside of the 0.2 percent annual chance floodplain
D	Areas of undetermined, but possible, flood hazards

During the public review period, the State Department of Land and Natural Resources Engineering Division confirmed the flood zone designations affecting the Petition Area and wrote that: "The National Flood Insurance Program does not have any regulations for developments within Zone X, however, it does regulate developments within Zone A and AE…Please note that the project must comply with the rules and regulations of the National Flood Insurance Program (NFIP) presented in Title 44 of the Code of Federal Regulations (44CFR), whenever development within a Special Flood Hazard Area is undertaken…Please be advised that 44CFR indicates the minimum standards set forth by the NFIP. Your Community's local flood ordinance may prove to be more restrictive and thus take precedence over the minimum NFIP standards. If there are questions regarding the local flood ordinances, please contact the applicable County NFIP Coordinators below:…Mr. Robert Sumitomo at (808) 768-8096 or Mr. Mario Siu Li at (808) 768-8098 of the City and County of Honolulu, Department of Planning and Permitting…" While it is highly unlikely that any development will be proposed on lands designated Zone A or AE, the Petitioner will continue to coordinate with the Department of Planning and Permitting to discuss project-related issues, including the City's local flood ordinance."

Anticipated Impacts and Mitigation Measures

The project is not expected to exacerbate any natural hazards. Potential damage from hurricanes and earthquakes will be mitigated by compliance with the Uniform Building Code adopted by the City and County of Honolulu. All structures will be constructed for protection from earthquakes and tropical hurricanes. The potential for soil slippage will be mitigated by over-excavation and other construction methods.

During the public review period of the Draft EIS, the State Civil Defense (SCD) commented that "the developer install at least three outdoor warning sirens… At the present time SCD personnel recommends that the minimum-size siren have a sound rating

of 121-decibels @ 100 feet, omni-directional and solar powered." SCD also noted that "As the development plans are finalized, State Civil Defense (SCD) will be better able to define the placement and size of the sirens." The Petitioner will continue to coordinate with the SCD as development plans are finalized to be better able to define the placement and size of the sirens.

3.7 FLORA

Existing Conditions

The Project Area consists of 10 distinct parcels of land (See Figure 1.5: Parcels Map). Parcels A, B, C, D1, D2 and G are situated makai of the H-1 Freeway while Parcels E1, E2, E3 and F are situated mauka of the H-1 Freeway. Botanical resources surveys of the Project Area were conducted by LeGrande Biological Surveys, Inc., in January, May and August 2006. The primary objectives of these studies were to: 1) prepare a general description of the vegetation on the Project Area; 2) provide an inventory the flora; and 3) search for and identify threatened and endangered species as well as species of concern. This report is included in Appendix B.

According to the botanical survey reports, most of the Project Area is currently plowed and devoid of trees and brush. Other lands within the Project Area are uncultivated brushland/or pastureland. The vegetation is typical of agriculturally cultivated cropland/or highly disturbed weedy areas. Little of the original native vegetation remains after over a century of intensive sugarcane agriculture and periodic burning. Native species have been replaced by aggressive non-native plant species. No federally listed endangered or threatened native plants, or candidate endangered species, were encountered on the property. Additionally, no wetlands occur on the property. Findings of the botanical resources surveys are summarized below.

Main Parcels (Parcels A, B, C and G)

Parcel A

Located between H-1 Freeway and Farrington Highway west of Palehua Road, the majority of the parcel is either in cleared land/or active corn (*Zea mays*) cultivation. The edges of Parcel A are dominated by weedy species such as castor bean (*Ricinus communis*), lion's ear (*Leonotis nepetifolia*), partridge pea (*Chamaecrista nictitans*), and kikania (*Xanthium strumarium* var. *canadense*). In addition, a small distribution of kiawe (*Prosopis pallida*) and opiuma (*Pithecelobium dulce*) trees are scattered along the top of Hunehune Gulch.

AR00027095

Parcel B

Located between H-1 Freeway and Farrington Highway with Fort Weaver Road bordering the parcel to the east, the majority of Parcel B is in active corn cultivation. Edges of fields are largely dominated by weedy shrubs such as koa haole (*Leucaena leucocephala*), Christmas berry (*Schinus terebinthifolius*), sourbush (*Pluchea carolinensis*), castor bean, and guinea grass (*Panicum maximum*). Honouliuli Gulch, which runs northwest-southeast through Parcel B, is largely dominated by koa haole, guinea grass, kukui (*Aleurites moluccana*), kiawe, pride of India (*Melia azerdarach*), and autograph tree (*Clusia rosea*). At the bottom of Honouliuli Gulch, koali ai (*Ipomoea cairica*), little bell (*Ipomoea triloba*), primrose willow (*Ludwigia octovalvis*), love-in-a-mist (*Passiflora foetida*), and comb hyptis (*Hyptis pectinata*) were observed.

An Aloun Farm, Inc.'s baseyard is also located within Parcel B. Various crops were observed on the site including citrus (*Citrus sp.*), noni (*Morinda citrifolia*), kalo (*Colocasia esculenta*), yellow Poinciana (*Peltophorum pterocarpum*), sugarcane (*Saccharum officinarum*), and lemon grass (*Cymbopogon citrates*). Along Farrington Highway, the vegetation is largely dominated by kiawe and monkeypod (*Samanea saman*) trees and bougainvillea (*Bougainvillea sp.*) scattered throughout the length of Parcel B.

Parcels C and G

Parcels C and G are bordered by Farrington Highway to the north, Old Fort Weaver Road to the east, Mango Tree Road to the south, and the planned North-South Road to the west. A large portion of the property is currently under cultivation of corn, melons (*Cucumis sp.*), basil (*Ocimum sp.*), and bananas. Three indigenous plant species were observed on the property: 'ilima (*Sida fallax*), 'uhaloa (*Waltheria indica*) and pōpolo (*Solanum americanum*).

A cliff of approximately 20-30 feet high runs along the eastern boundary of Parcel C. The majority of the cliff area is dominated by kiawe and guinea grass. Indigenous plant species such as 'ilima, 'uhaloa and pōpolo can be found along the top of cliff.

The southern section of site between Old Fort Weaver Road and the cliff contains areas that are in active agricultural cultivation. Basil, cucumber (*Cucumis sativus*) and horseradish tree (*Moringa oleifera*) can be found growing at this particular operation. Coconut trees (*Cocos nucifera*), papaya (*Carica papaya*) and bamboo (*Bambusa sp.*) can also be observed growing around this lessee's facilities.

New 440 Tank, Transmission Line, & New 228 Tank Site (Parcels E2, E3, and F)

The majority of the property, located north of H-1 Freeway and proposed for the Reservoir and Waterline, consists of either a dirt roadway or uncultivated fields.

AR00027096

At the lower elevation (220 feet) site, an additional water tank is proposed to be constructed west of an existing water tank. The graded areas are dominated by weed plant species including buffelgrass, guinea grass, beggar tick, sourbush (*Pluchea carolinensis*), castor bean (*Ricinus communis*), and koa haole.

A dirt roadway, where the proposed waterline is to be constructed along, connecting the lower water tank site to the upper tank site is dominated by weedy plant species such as castor bean, koa haole, boerhavia (*Boerhavia coccine*a), Australian saltbush (*Atriplex semibaccata)*, spiny amaranth, khaki weed (*Alternanthera pungens*), and Mexican poppy (*Argemone mexicana*). One indigenous plant species, 'uhaloa, was observed along the dirt roadway.

The upper elevation (440 feet) site is proposed for the construction of two water tanks. The property, located adjacent to an existing HECO substation, is an uncultivated pineapple field largely dominated by pineapple (*Ananas comosus*) and balsam pear (*Momordica charantia*) vines. African tulip, Christmas berry (*Schinus terebinthifolius*), and dogtail (*Buddleia asiatica*) were also spotted throughout the field. Autograph trees (*Clusia rosea*) and tropical coral trees (*Erythrina variegate*) were observed along the HECO substation perimeter fence. One indigenous plant species, pōpolo, was observed within the upper elevation site.

Makai Detention Site (Parcels D1 and D2)

The majority of the property is either in active cultivation or uncultivated fields. The uncultivated lands are largely dominated by weedy plant species such as koa haole, guinea grass, and other weedy plant species. Two indigenous plant species, 'ilima and 'uhaloa were observed at the property.

Due to access issues that prevented the botanical consultants from surveying the detention parcel that terminates in Pearl Harbor (Parcel D2), the property was observed from a nearby footpath and appears to be dominated by kiawe.

Anticipated Impacts and Mitigation Measures

None of the plant species which occurred on the Petition Area are considered a threatened ~~and~~ or endangered species or a species of concern. During the public review period, the State Department of Land and Natural Resources, Division of Forestry and Wildlife wrote that it had no objections to the proposed project.

The Hawaii Biodiversity and Mapping Program (HBMP) supplied historical and present locations of known threatened and endangered plant species within the Petition Area for review. The only rare plant mapped near the Petition Area was the ko'oloa'ula (*Abutilon menziesii*) population at the southern end of North-South Road. There were no threatened or endangered plants mapped within the Petition Area itself. *A. menziesii* is protected by

AR00027097

both the federal Endangered Species Act of 1973, as amended, and Chapter 195D, HRS, as amended. *A. menziesii* is a shrub of the mallow family, growing six to eight feet tall, with coarsely toothed, silvery, heart-shaped leaves that are about one to three inches long. Flowers are medium red to dark red and less than an inch in diameter. It has been sold as an ornamental plant at local nurseries in the past under the name "Red 'ilima." Other extant populations of ko'oloa'ula currently exist on Lāna'i and Maui.

As part of the environmental planning for North-South Road and a portion of Kapolei Parkway, a *Habitat Conservation Plan for Abutilon menziesii at Kapolei* was finalized in March 2004. Mitigation measures have already been specified for these populations of *A. menziesii* related to construction of North-South Road. Although a concerted effort was made in surveying for ko'oloa'ula, no plants were observed on the property. As such, the proposed project is not expected to have a significant negative impact on the botanical resources in this part of O'ahu.

Native and indigenous vegetation will be considered in the selection of plant materials when a landscaping master plan is prepared.

3.8 FAUNA

Existing Conditions

The Project Area consists of 10 distinct parcels of land (See Figure 1.5: Parcels Map). Parcels A, B, C, D1, D2 and G are situated makai of the H-1 Freeway while Parcels E1, E2, E3 and F are situated mauka of the H-1 Freeway. Faunal resources surveys of the Project Area were conducted by Rana Productions, Ltd., in July, August and September 2006 (See Appendix C). The primary objectives of these studies were to: 1) prepare a general description of the Project Area; 2) to determine if there were any avian or mammalian species currently listed as endangered, threatened or proposed for listing under either Federal or State of Hawai'i endangered species statutes; and 3) provide information on the relative abundance of avian species within the various parcels.

Main Parcels (Parcels A, B, C and G)

Parcel A is located between H-1 Freeway and Farrington Highway west of Palehua Road. Parcel B is located between H-1 Freeway and Farrington Highway with Fort Weaver Road bordering the parcel to the east. Honouliuli Gulch runs northwest-southeast through Parcel B. Parcel C is bordered by Farrington Highway to the north, Old Fort Weaver Road to the east, Mango Tree Road to the south, and the planned North-South Road to the west. A cliff of approximately 20-30 feet high runs along the eastern boundary of Parcel C. Parcel G is surrounded by Parcel C and abuts Mango Tree Road.

The majority of the "Main Parcels" are made up of former sugar cane land, some of which is barren and some of which is under active cultivation with crops such as corn and

AR00027098

bananas. The habitat on all of the parcels is almost completely dominated by alien plant species. Mammalian surveys using both direct visual or auditory and detection of indirect of evidence (tracks, scat or sign) revealed only alien species, including house mouse (*Mus musculus domesticus*), dog (*Canis f. familiaris*), mongoose (*Herpestes a. auropunctatus*), horse (*Equus c. caballus*) and cat (*Felis catus*). The lone listed terrestrial mammalian species, Hawaiian hoary bat (*Lasiurus cinereus semotus*) was not detected during the course of the faunal surveys.

Twenty-four avian species were recorded during the survey of the main parcels, including two indigenous migratory shorebird species, the Pacific Golden Plover (*Pluvialis fulva*) and Ruddy Turnstone (*Arenaria interpres*). The remaining 22 species are alien and include pheasants, partridges, herons, pigeons and doves, bulbuls, larks, starlings, sparrows, mockingbirds and finches. While not observed during the survey, the Short-eared Owl, or Pueo (*Asio fammeus sandwichensis*) is known to exist in the 'Ewa region, and may be present in the area. The State of Hawai'i lists the O'ahu population of the Pueo as an endangered species, while the federal statute does not.

The site does not contain any unique habitat, and modification of any or all of the habitat present will have no deleterious effect on any mammalian or avian species currently listed as endangered or threatened, or proposed for listing under either the federal or state endangered species statutes.

New 440 Tank, Transmission Line, & New 228 Tank Site (Parcels E2, E3 and F)

The majority of the property, located north of H-1 Freeway and proposed for the Reservoir and Waterline, consists of either a dirt roadway or uncultivated fields. The upper elevation (440 feet) site is proposed for the construction of two water tanks and 5,600 feet of transmission lines. The property is located adjacent to an existing HECO substation and contains two existing BWS water tanks and a transmission line. The proposed location of the 440 tank is a former pineapple field, now fallow. The entire site is dominated by alien plant species.

Three alien mammalian species were found: dogs, cats and mongooses. The endangered Hawaiian Hoary Bat was not observed.

Thirteen different avian species were observed, including the indigenous migratory shorebird species, Pacific Golden Plover. While not observed, the Pueo may be present in the area. The remaining 12 species are alien species, including: finches, pheasants, partridges, herons, pigeons and doves, bulbuls, starlings, mynas, cardinals and finches. The Common Waxbill (*Estrilda astrid*), Zebra Dove (*Geopelia striata*) and Japanese White-eye (*Zosterops japonicus*) accounted for about 40% of the total number of avian species recorded. Diversity and density were relatively low, not surprising given the severely diminished habitat on most of the site.

AR00027099

Among mammalian species, it is likely that the house mouse and rats are present, although not observed. Rats and mice are deleterious to native ecosystems and to the faunal species that depend on them for their survival.

The site does not contain any unique habitat. Modification along the dirt road or in the area designated for the reservoirs and accessory facilities will have no deleterious effect on any mammalian or avian species currently listed as endangered or threatened, or proposed for listing under either the federal or state endangered species statutes.

Makai Detention Site (Parcels D1 and D2)

This site is east of Fort Weaver Road and south of the Honouliuli Unit of the Pearl Harbor National Wildlife Refuge. It is transected by the former OR&L railway line. A storm water detention basin is proposed to be located on the northern third of the site. The southern third is in active cultivation with corn and tomatoes. Vegetation on the site is almost completely dominated by alien species.

There were three alien mammalian species found: dog, cat and mongoose.

Twenty different avian species were recorded, 17 of which are alien. The Common Waxbill, Zebra Dove and Spotted Dove (*Streptopelia chinensis*) accounted for nearly half of the birds sighted. Other alien species included pheasants, partridges, herons, pigeons and doves, bulbuls, starlings, sparrows and mockingbirds.

The three indigenous species include the Black-crowned Night-Heron (*Nycticorax nycticorax hoactli*), a resident indigenous breeding species, and the Pacific Golden-Plover and Ruddy Turnstone, indigenous migratory shorebirds that breed in the Arctic. While not observed during this survey, the Pueo has been observed in the past in the nearby National Wildlife Refuge and may be present in the area.

Four waterbird species are currently listed as endangered under both the State and Federal statutes. The endangered water bird species consist of the Hawaiian Duck x Mallard hybrids (*Anas wyvilliana x platyrhynchos*), Common Moorhen (*Gallinula choropus sandvicensis*), Hawaiian Coot (*Fulica alai*) and Black-necked Stilt (*Himantopus mexicanus knudseni*). These species breed in the Honouliuli Unit of the National Wildlife Refuge, less than a sixth of a mile (250 meters) north of Parcels D1 and D2, and are regularly encountered on the golf course to the northwest. While the planned detention basin is located near the Refuge, there is no suitable habitat for these waterbirds. According to Bills Engineering, the project civil engineer, the makai drainage will rarely contain standing water.

During the public review period, the Land Use Commission requested an assessment of arthropods on the Petition Area. A survey of arthropods on the Petition Area was conducted on May 9, 2008 by Dr. Gregory Brenner of Pacific Analytics, L.L.C. The

AR00027100

primary objectives of the survey were to: provide a general description of the arthropod fauna of the Petition Area; evaluate the habitats (if any); and search and assess the potential for threatened or endangered arthropod species as well as species of concern. According to Dr. Brenner, the arthropod species that were collected during the study would be considered typical of what would be found in lowland sites with little or no native vegetation and disturbed by agricultural operations. No species were found that are locally unique to the site. A copy of the assessment is attached to this EIS as Appendix R.

There is no expected deleterious effect on faunal species from the proposed project development. The site does not contain any unique habitat, and any modification will have no deleterious impact on any species currently listed as endangered or threatened, or proposed for listing under either the federal or state endangered species statutes.

Anticipated Impacts and Mitigation Measures

The mammalian and avian species currently found within the Project Area are by and large alien species. All of the mammalian species identified are alien and only three of the avian species present are indigenous. A variety of rats and mice are present in some locations, and are strongly suspected to be present in other areas. The endangered Hawaiian Hoary bat was not detected during the course of the faunal surveys.

The majority of the sites surveyed within the Project Area are lands formerly cultivated in sugarcane or pineapple, having led to high degrees of disturbance or destruction of native habitat. Current habitats are deemed "depauperate" (severely diminished) by the biological consultant. Some of the sites are currently under partial cultivation, but those habitats likewise have been severely degraded. During the public review period, the State Department of Land and Natural Resources, Division of Forestry and Wildlife wrote that it had no objections to the proposed project.

The notable exceptions to the above are the four endangered waterbird species which currently inhabit the National Wildlife Refuge located north of Parcels D1 and D2. These birds may utilize the proposed detention basin if sufficient water collects to allow ponding. There may be periodic disturbance to the waterbird species if temporary construction occurs within the proposed detention basin (to enlarge it) or if an outlet is allowed. As previously noted, the waterbirds breed in the Honouliuli Unit of the National Wildlife Refuge, less than a sixth of a mile (250 meters) north of Parcels D1 and D2. While the planned detention basin is located near the Refuge, there is no suitable habitat for these waterbirds. According to Bills Engineering, the project civil engineer, the makai drainage will rarely contain standing water.

At the present time there is no federal nexus associated with this project, because it does not appear that the U.S. Navy will permit access or grant an easement for an outlet from the proposed makai drainage retention basin. If and when this component of the

AR00027101

proposed development moves forward, the Petitioner will consult with both the U.S. Fish and Wildlife Service and the State of Hawai'i Division of Forestry and Wildlife to ensure that the construction and operation of the detention basin does not result in deleterious impacts to any species currently listed as endangered, threatened or proposed for listing under either federal or State of Hawai'i endangered species statutes.

Otherwise, ~~I~~impacts to the other existing mammalian and avian species and their habitats are expected to be minimal. Disturbance and displacement of individual alien species is likely to occur as construction and development infill takes place. The disturbance will be of a temporary nature. No mitigation measures are proposed for any faunal species detected during the course of the faunal surveys.

The results of the arthropod survey at the Petition Area (See Appendix R) indicate that there are no special concerns or legal constraints related to invertebrate resources in the Petition Area. No invertebrate species listed as endangered, threatened or that are currently proposed for listing under either federal or State of Hawai'i endangered species statutes are known to exist on the project site.

AR00027102

4.0

Assessment of the Human Environment, Potential Impacts, & Mitigation Measures

4.0 ASSESSMENT OF THE HUMAN ENVIRONMENT, POTENTIAL IMPACTS, AND MITIGATION MEASURES

This section describes the existing human environment associated with the Petition Area and the project's potential impacts that may result from proposed development. Mitigation measures are proposed to address the project's potential project impacts.

4.1 ARCHAEOLOGICAL AND HISTORIC RESOURCES

Existing Conditions

An archaeological inventory survey report for the Project Area was conducted in February 2006 by Cultural Surveys Hawai'i Inc. (CSH). This report is included in Appendix D.

Five historic properties (SIHP Nos. 50-80-12-4344, 4345, 4346, 4347, and 4348) were documented during Cultural Surveys Hawai'i's archaeological inventory survey of the Petition Area. All five historic properties have been assessed as eligible for the State Register of Historic Places under Criteria C and D, except for Site 4344, which is only eligible under criterion D. The State Historic Preservation Division (SHPD) concurs with these significance assessments. All five historic properties are located in the vicinity of Old Fort Weaver Road) (See Figure 4.1: Historical Sites).

SIHP Nos. 50-80-12-4344. A survey conducted by CSH in 1990 identified three iron pipe features, including a tall metal post and two welded pipe constructions, located in the vicinity of the Drivers/Stable Villages. The age and function of these features elucidate out record of plantation life in 'Ewa. A more recent inventory study conducted by CSH in 2005 could not locate the previously identified features as the area had been bulldozed and the features destroyed. However, four additional plantation infrastructure features adjacent to Honouliuli Gulch were identified. These features were added to the site description, and will not affect the significance and recommendation for this site ("no preservation").

SIHP Nos. 50-80-12-4345 (Ewa Plantation Railroad Berm). The Ewa Plantation Company operated an approximately 30-mile private railroad from 1890 – 1947 for the primary purpose of the transport of sugar cane. While the railroad runs throughout the Petition Area, a particularly good section of railroad can be found in the northeastern portion of the Petition Area in the mouth of a dry stream valley. A railroad berm runs on both sides of the valley access road with well-preserved facings approximately 2 meters in height. The archaeological consultant recommended that the railroad berm be preserved through incorporating the feature into the development of the project where feasible.

AR00027104

SIHP Nos. 50-80-12-4346 (Northern Pumping Station). A survey conducted by CSH in 1990 previously determined the site's significance under Criteria C and D. The site consists of a pumping station with a deep rectangular basalt block, faced wall. The site is believed to pre-date 1928. An adjacent single pump house, which has an exterior or corrugated sheet metal panel construction, is located nearby. The archaeological consultant recommended that the well be preserved and that issues of significance and proper historic documentation be resolved with the SHPD office in advance of any development in the area to avoid adverse impacts. A preservation plan has been drafted and will be submitted to SHPD for review and comments.

SIHP Nos. 50-80-12-4347 (Central Pumping Station). A survey conducted by CSH in 1990 previously determined the site's significance under Criteria C and D. The site consists of a pumping station with a deep rectangular basalt block, faced wall. The site is believed to pre-date 1928. Eight features related to and in the immediate vicinity of the well include a number of small architectural and/or industrial features. The archaeological consultant recommended that the well and portions of the site be preserved. The significance of the site would be evaluated after an assessment of the significance of the architectural features and the assessment of the significance of the 'Ewa Village area. A preservation plan has been drafted and will be submitted to SHPD for review and comments.

SIHP Nos. 50-80-12-4348 (Southern Pumping Station). A survey conducted by CSH in 1990 previously determined the site's significance under Criteria C and D. The site consists of a pumping station with a deep rectangular basalt block, faced wall. The site is believed to be constructed shortly after 1928. An adjacent single pump house, which has an exterior or corrugated sheet metal panel construction, is located nearby. The archaeological consultant recommended that the well be preserved and that issues of significance and proper historic documentation be resolved with SHPD in advance of any development in the area to avoid adverse impacts. A preservation plan has been drafted and will be submitted to SHPD for review and comments.

Research of earlier maps indicates four areas of interest: the Honouliuli taro lands, Kapalani Church, Pipe Line Village and Drivers/Stable Villages. All are located in the vicinity of Old Fort Weaver Road, well below from the main development area.

The Honouliuli taro lands were probably nineteenth century (and earlier) Hawaiian habitation and agricultural area. However, no surface or subsurface remains were found during the 2005 inventory survey. CSH has determined that no additional testing is necessary. However, CSH is recommending on-call/on-site archaeological monitoring during any future development in this area. SHPD concurs with this recommendation.

The Kapalani Church was a nineteenth century Hawaiian Catholic Church, schoolhouse and possible cemetery area. Pipeline Village and the Drivers/Stable Villages were early twentieth century immigrant plantation habitation camps. No surface or subsurface

PBR HAWAII & ASSOCIATES, INC.

remains were found during the 2005 inventory survey. CSH has determined that no additional inventory survey is necessary. However, CSH is recommending on-call/on-site archaeological monitoring during any future development in this area. SHPD concurs with this recommendation.

In summary, SHPD concurs with the consulting archaeologist's (Cultural Surveys Hawai'i Inc.) mitigation recommendations, which include: (1) no further archaeological work at Site 4344, (2) preservation of Sites 4345, 4346, 4347, and 4348, and (3) archaeological monitoring in the vicinity of the four areas of historic habitation (Honouliuli taro lands, Kapalani Catholic Church, Pipeline Village, and Drivers/Stable Village).

Anticipated Impacts and Mitigation Measures

According to SHPD, the archaeological inventory survey report is now accepted in fulfillment of Sections 13-284 and 13-276, HAR (See Appendix E). A preservation plan and archaeological monitoring plan will be prepared and submitted to SHPD for their review and approval. All five sites are located near Old Fort Weaver Road and well away (and below the bluff) from the main Petition Area. Should any archaeologically significant artifacts, bones, or other indicators of previous on-site activity be uncovered during construction, work will stop immediately and the Department of Land and Natural Resources, Historic Preservation Division (SHPD) will be notified in accordance with applicable regulations.

4.2 CULTURAL RESOURCES

Existing Conditions

A cultural impact assessment for the Project Area was conducted in December 2006 by Cultural Surveys Hawai'i Inc. (CSH). This report is included in full in Appendix F. A summary is presented below.

The Petition Area is located in the ahupua'a of Honouliuli, in the 'Ewa district on the island of O'ahu. Honouliuli, translated as "dark water" or "blue harbor," is the largest ahupua'a in the moku (district) of 'Ewa. Honouliuli consists of lands stretching from the western boundary of Pu'uloa (Pearl Harbor) to the 'Ewa/Wai'anae district boundary.

Honouliuli is associated with a number of legendary accounts. Many of these concern the actions of gods or demi-gods such as Kāne, Kanaloa, Māui, Kamapua'a, the reptile deity (mo'o) Maunauna, the shark deity Ka'ahupāhau, and the demigod hero Palila. While there are several references to chiefly lineages and references to the ruling chiefs Hilo-a-Lakapu and Kūali'i, there is no clear reference to powerful chiefs living permanently in Honouliuli.

AR00027107

The accessibility of Honouliuli lands, including the proposed Project Area, to the Hawaiians for gathering or other cultural purposes was radically curtailed during the second half of the nineteenth century. By the 1870s, herds of cattle grazing across the 'Ewa Plain probably denuded the landscape of much of the native vegetation. Subsequently, during the last decade of the nineteenth century, the traditional Hawaiian landscape was further distorted by the introduction and rapid development of commercial sugar cane cultivation. Throughout the twentieth century, sugar cane cultivation was the dominating land use activity within the Petition Area and surrounding areas. Sugar cane cultivation, and the sense that most of the Ewa plain was private property, restricted access inside the Petition Area and surrounding areas to employees of 'Ewa Plantation.

Previous Settlements

There are three areas of early settlement in the Honouliuli ahupua'a: the extensive limestone plain with recurrent use as habitation for fishermen and gatherers and sometime gardeners; the uplands around Pu'uku'ua associated with kauwā (slave or servant) residences but probably used for agriculture and forest resources; and the rich cultivated lands of the Honouliuli 'ili (subdivision of an ahupua'a) for extensive wetland taro and clearly the ahupua'a population center. These irrigated lands are centered around the west side of Pearl Harbor at Honouliuli Stream and its broad outlet into West Loch.

Consultation

Hawaiian organizations, government agencies, community members, and cultural and lineal descendants with ties to 'Ewa were contacted to: (1) identify potentially knowledgeable individuals with cultural expertise and knowledge of the Petition Area and its surroundings, and (2) identify cultural concerns and potential impacts within the Petition Area. An effort was made to locate informants with ties to 'Ewa and neighboring ahupua'a who live, or had lived in the region or who, in the past, used the area for traditional and cultural purposes. For this assessment, Arline Eaton, Richard Hirata, Richard Oshiro, Kenneth Soma, Charles Nakamatsu and other kūpuna were interviewed. They mentioned that in the past there was traditional gathering of taro and salt, along with fish such as pāpio, mullet, as well as oysters, clams and a variety of crab along the banks of Pearl Harbor. They all referred to this area of rich marine resources as Chocolate Beach and Three Stones (along Pearl Harbor). The people contacted were not aware of any on-going cultural practices, archaeological sites, trails, or burials within the Petition Area. Most of the people contacted mentioned that the Petition Area was heavily altered by plantation activities.

AR00027108

Conclusion

While Honouliuli is associated with a number of legendary accounts involving gods, demi-gods and chiefly lineages, there is no clear reference to powerful chiefs living permanently in Honouliuli. Access to Honouliuli lands, including the Petition Area, by Hawaiians for gathering or other cultural purposes was radically curtailed during the second half of the nineteenth century. Herds of cattle grazing across the 'Ewa Plain likely denuded the landscape, which was subsequently further distorted by the introduction and rapid development of commercial sugar cane cultivation. Throughout the twentieth century, sugar cane cultivation was the dominating land use activity. These two factors give evidence of the area's decline as a population center, and the disappearance of reasons to access it.

Based on results of the consultation process, the evidence from Land Court Awards (LCAs) and lack of resources, the vast majority of the Petition Area was utilized less intensively during traditional times. Based on this evidence, no contemporary or continuing cultural practices occur within the Petition Area at present.

Anticipated Impacts and Mitigation Measures

The Petition Area was used for ranching and the production of commercial sugar, and portions of the property continue to be used for agricultural purposes under short-term agreements. Ranching and sugar cane production would have most likely destroyed any cultural resources on the property. Subsurface historic properties associated with former traditional Hawaiian activities in the project area, such as artifacts, cultural layers or burials, may be present despite the decades of destructive modern activities. The Project Area is approximately 600m (approximately 2,000 feet) back from the coast. Therefore, access to marine resources will not be affected.

As a precautionary measure, personnel involved in construction or development activities will be informed of the possibility of inadvertent cultural or skeletal finds, and will cease work immediately, secure the area and notify the proper authorities in the event of such discoveries.

Currently, no contemporary or continuing cultural or traditional practices occur within the proposed Petition Area. Therefore, no impacts are expected and no mitigation measures are planned.

AR00027109

4.3 NOISE

Existing Conditions

An environmental noise assessment report for the Petition Area was conducted in February 2008 by D.L. Adams Associates, Ltd. This report is included in Appendix G.

The Ho'opili project is currently exposed to varying daytime ambient noise levels, depending on the proximity to major roadways. The areas adjacent to H-1 Freeway and Farrington Highway experience high ambient noise levels during peak traffic hours. Ambient noise levels range from 59 to 72 dBA adjacent to the H-1 Freeway and 44 to 59 dBA adjacent to Farrington Highway. The ambient noise environment is relatively low in areas that are far from the major roadways, where ambient noise levels range from 37 to 60 dBA. The dominant noise sources are traffic, birds, wind, occasional distant aircraft flyovers and farm equipment.

Aircraft activity in the vicinity of the 'Ewa area generated from the Kalaeloa Airport and Honolulu International Airport may be audible at the Ho'opili project. In its comments on the Draft EISPN, the State DOT wrote that single-event noise may occur from potential overflights of aircraft or under certain weather/atmospheric conditions, particularly from aircraft approaching or departing Kalaeloa Airport. However, the overflights of aircraft are infrequent and the Ho'opili project is located well outside of the 55 dBA noise contour for both airports. Even when no aircraft is flying near the Petition Area, noise is generated by traffic on adjacent roadways, including the H-1 Freeway, Farrington Highway, Kunia Road and Fort Weaver Road. Wind through vegetation and birds also generate noise within the Petition Area.

Anticipated Impacts and Mitigation Measures

Construction Noise

Noise will be generated by construction and earth-moving equipment during the project's development. However, over the life of the project, depending where development will occur, construction noise will be relatively short-term, occur only during daytime hours, and comply with ~~DOH noise regulations~~ Chapter 11-46, HAR (Community Noise Control). Noise impacts will only be heard on margins of the Petition Area that border sensitive land uses, such as existing residential uses on the eastern boundary (minimal development is currently contemplated along Old Fort Weaver Road) and the southern boundary (buffered by the 'Ewa Villages Golf Course) of the Petition Area. In general, the Petition Area is surrounded by roads or open space; thus there are relatively few current residents that would be impacted by construction noise. There are no adjacent schools or hospitals to the Petition Area.

AR00027110

If construction noise is expected to exceed DOH's maximum permissible property line noise levels, a permit will be obtained from the DOH to allow the operation of vehicles, construction equipment, power tools, et cetera. Additionally, construction equipment, vehicles or devices will be equipped with mufflers, as necessary.

Operational Noise

Over the long-term operation of the project, several new noise generating activities (such as new land uses, additional traffic) will be introduced, which are not currently present; and introduced new residents to ongoing noise generating activities (such as aircraft noise, future traffic without the project on surrounding roads, transit).

The proposed land uses may include noise generating activities which could impact future residents. The proposed land use plan was designed to acknowledge that the only neighboring residential areas are located along Old Fort Weaver Road below a bluff where most of the Petition Area is located. Thus, no new residential is currently being proposed in this area. Proposed land uses closest to Honouliuli include a natural park area and medical-related office use.

The project is designed to have higher densities than the existing Villages of Kapolei, and as such, will present similar ambient noise conditions as might be expected where a mix of multi-family residential and commercial uses occur. Noise mitigation measures will be incorporated into the project design to prevent such impacts, such as installing landscaping, and installing mufflers and/or erecting barriers around noisy mechanical equipment (such as air conditioning). Consideration will be given to the layout of the commercial areas to meet State Department of Health noise regulations and reduce the noise impact. It is expected that the Petitioner will likely include restrictions on hours of operations on commercial uses in order to minimize the impact of potential noise producing uses such as bars and nightclubs or indoor recreational land uses. Project activities will comply with Chapter 11-46, HAR (Community Noise Control).

Increases in peak hour traffic noise along Fort Weaver Road due to the project are estimated to be less than 1 dB. Increases in peak hour traffic noise along Old Fort Weaver Road due to the project are estimated to be between 3 and 8 dB. This is acknowledged to be a significant increase for homes currently located along Old Fort Weaver Road impacting approximately 35 homes.

Vehicular traffic noise from the H-1 Freeway and from Farrington Highway and Fort Weaver Road may significantly impact the proposed development. The developer will take appropriate measures in the design, layout and construction facilities in these areas to minimize or mitigate such that exterior noise. These steps may include but are not limited to: air conditioning facilities to reduce ambient noise levels, and traffic noise mitigation measures, such as an earthen berm or noise barrier wall. The developer proposes to notify

AR00027111

all buyers within 120 feet of the H-1 Freeway, Farrington Highway and Fort Weaver Road that they may experience exterior noise levels of 67 dBA or greater.

Aircraft noise due to operations at nearby Kalaeloa Airport and the Honolulu International Airport may be audible at the project site. However, flights directly above the site are infrequent and the project site is outside of the Ldn 55 noise contour for both airports. Therefore, a significant noise impact due to aircraft noise is not expected. However, per the comments made by the State Department of Transportation during the Draft EIS public review period, prospective occupants will be made aware of the potential for such occurrences.

The proposed alignments of the future Honolulu rail transit system run along Farrington Highway and North-South Road (or possibly diagonally though the Petition Area) and may include two transit stations. The developer proposes to notify all buyers along the proposed transit alignment and nearby the transit stations that they can expect to experience noise from the transit guideway and/or transit stations during the hours the transit system will be in operation.

Exterior noise levels at two school sites (H-1 Freeway/Kunia Road and Farrington Highway) will exceed the Hawaii State Board of Education (BOE) Policy 6700 noise limit of L10 = 65 dBA (before mitigation). During the Draft EIS public review period, the DOE commented that schools should not be located at sites where noise levels exceed 65 dBA. Policy 6700 requires that air conditioning be provided to schools that are exposed to exterior noise levels in excess of the noise limit. The layout and construction of the school should be carefully designed such that exterior noise will not disturb learning activities and interfere with speech intelligibility. To reduce ambient noise levels at the school site, traffic noise mitigation measures may also be necessary, such as an earthen berm or noise barrier wall, or siting the buildings along high noise-generating roadways to essentially serve as noise barriers.

4.4 AIR QUALITY

An Air Quality Study for the Petition Area was conducted in February 2008 by B.D. Neal & Associates to describe the existing air quality in the Petition Area and to assess the potential short- and long-term direct and indirect air quality impacts that could result from construction and use of the proposed project. The study also discussed proposed measures to mitigate impacts by the project. This report is included in Appendix H.

Existing Conditions

Air Quality Standards. Both Federal and State standards have been established to maintain ambient air quality. At the present time, seven parameters are regulated including: particulate matter, sulfur dioxide, hydrogen sulfide, nitrogen dioxide, carbon monoxide, ozone and lead. State air quality standards are comparable to the Federal

AR00027112

standards, except those for nitrogen dioxide and carbon monoxide, which are more stringent than the Federal standards.

Climate. Regional and local climate together with the amount and type of human activity generally dictate the air quality of a given location. The climate of the 'Ewa area is very much affected by its leeward and coastal situation. Winds are predominantly trade winds from the east-northeast except for occasional periods when Kona storms may generate strong winds from the south or when the trade winds are weak and landbreeze-seabreeze circulation may develop. Wind speeds typically vary between about 5 to 15 miles per hour proving relatively good ventilation much of the time. Temperatures in the leeward O'ahu area are generally very moderate with average daily temperatures ranging from about 65 degrees Fahrenheit (F) to 84 degrees F.

The extreme minimum temperature recorded at the nearby (former) 'Ewa Plantation is 47 degrees F, while the extreme maximum temperature is 93 degrees F. This are of O'ahu is one of the drier locations in the state with rainfall often highly variable from one year to the next. Monthly rainfall has been measured to vary from as little as a trace to as much as 15 inches. Average annual rainfall amounts to about 21 inches with summer months being the driest.

Existing Pollution Sources. Air quality in the Petition Area is mostly affected by air pollutants from motor vehicles, industrial sources, agricultural operations and to a lesser extent natural sources. Much of the particulate emissions on O'ahu originate from area sources, such as the mineral products industry and agriculture. Sulfur oxides are emitted almost exclusively by point sources, such as power plants and refineries. Nitrogen oxides emissions emanate predominantly from industrial point sources, although area sources (mostly motor vehicle traffic) also contribute a significant share. The majority of carbon monoxide emissions occur from area sources (motor vehicle traffic), while hydrocarbons are emitted mainly from point sources. Based on previous emission inventories that have been reported for O'ahu, emissions of particulate and nitrogen oxides may have increased during the past ten years, while emissions of sulfur oxides, carbon monoxide, and hydrocarbons have probably declined.

The H-1 Freeway is a major arterial roadway that presently carries moderate to heavy levels of vehicle traffic during peak traffic hours. Emissions from motor vehicles using this roadway, primarily nitrogen oxides and carbon monoxide, will tend to be carried away from the Petition Area by the prevailing winds.

Several sources of industrial air pollution are located in the Campbell Industrial Park, which is located six miles from the Petition Area toward the southwest. Industries currently operating at Campbell Industrial Park include the Chevron and BHP refineries, the Honolulu Program of Waste Energy Recovery (H-POWER) facility, Kalaeloa Partners, Applied Energy Services, Hawaiian Cement and others. The Hawaiian Electric Company, Inc. (HECO) Waiau Generating Station is located a few miles to the south at Pearl City.

AR00027113

These industries emit large amounts of sulfur dioxide, nitrogen oxides, particulate matter, carbon monoxide and other air pollutants; however, prevailing winds from the east or northeast carry these emissions away from the Petition Area most of the time.

Until recently, air pollution in the Petition Area originating from agricultural sources could mainly be attributed to sugar cane operations in the 'Ewa area and to pineapple cultivation in the central O'ahu area. Emissions from both the sugar mill and the canefield operations in the area have now been eliminated with the closure of Oahu Sugar Company, Ltd. (OSCo). Much of the former sugarcane lands are currently being used as pastureland or for diversified agriculture. Also, pineapple cultivation has been significantly reduced. Therefore, air pollution from agricultural sources in the Petition Area has been substantially reduced over the course of the past several years.

Natural sources of air pollution emissions that could also affect the Petition Area but cannot be quantified very accurately include the ocean (sea spray), plants (aero-allergens), wind blown dust and perhaps distant volcanoes on the island of Hawai'i.

Summary of Existing Air Quality Conditions. The present air quality of the Petition Area appears to be relatively good based on nearby air quality monitoring data.

Based on air quality data from the nearest monitoring stations operated by DOH, it appears likely that the State Ambient Air Quality Standards (AAQS) for sulfur dioxide, nitrogen dioxide, ozone, and lead are currently being met at the Petition Area. Concentrations of particulate matter normally comply with State and Federal standards, except occasionally on New Years Day (fireworks activity). While carbon monoxide measurements at the Kapolei monitoring station suggest that concentrations are within the State and Federal standards, local "hot spots" may exist near traffic-congested intersections.

Anticipated Impacts and Mitigation Measures

It may be inevitable that some short- and/or long-term impacts on air quality will occur either directly or indirectly as a result of project construction and use.

Short-term Impacts and Mitigation. Short-term direct and indirect impacts on air quality will likely occur during the project construction phase. Two potential types of air pollution emissions that could directly result in short-term air quality impacts during project construction include: 1) fugitive dust from vehicle movement and soil excavation; and 2) exhaust emissions from on-site construction equipment. Exhaust emissions from stationary and mobile construction equipment, from the disruption of traffic, and from workers' vehicles may affect air quality during the construction period.

State air pollution control regulations require that there be no visible fugitive dust emissions at the property line. Hence, an effective dust control plan must be implemented

AR00027114

to ensure compliance with State regulations. Fugitive dust emissions can be controlled to a large extent by watering active work areas, using wind screens, keeping adjacent paved roads clean and covering open-bodied trucks. Other dust control measures could include limiting the area that can be disturbed at any given time and/or mulching or chemically stabilizing inactive areas that have been worked. Paving and landscaping of Project Areas early in the construction schedule will also reduce dust emissions. Monitoring dust at the project boundary can help to evaluate the effectiveness of the dust control program. Exhaust emissions can be mitigated by moving construction equipment and workers to and from the project site during off-peak traffic hours.

All construction activities on the project site will comply with State Air Pollution Control regulations and the provisions of Section 11-60.1-33, HAR, on Fugitive Dust. An effective dust control plan for the construction phase will be implemented, and particular care will be taken when construction activities take place near existing homes, businesses or highways.

Long-term Impacts and Mitigation. After construction, motor vehicles traveling to and from the proposed development will result in a long-term increase in air pollution emissions in the Petition Area.

To evaluate the potential long-term indirect ambient air quality impact of increased roadway traffic associated with the project, computerized emission and atmospheric dispersion models were used to estimate ambient carbon monoxide concentrations along roadways leading to and from the project. Maximum carbon monoxide concentrations typically coincide with peak traffic periods; therefore, air quality impacts were assessed during the morning and afternoon peak traffic periods evaluated by the traffic study (See Section 4.8.1 and Appendix H). Air quality analyses were conducted for the following intersections:

- Farrington Highway at Fort Weaver Road (Northbound Ramps);
- Farrington Highway at Leokū Street;
- Fort Weaver Road at Old Fort Weaver Road;
- Fort Weaver Road at Renton Road;
- Farrington Highway at Fort Barrette Road;
- North-South Road at H-1 Freeway (Eastbound Ramps);
- North-South Road at Farrington Highway; and
- North-South Road at Kapolei Parkway.

For the Ho'opili project, four scenarios were selected for the carbon monoxide modeling study: 1) Year 2007: Existing Conditions; 2) Year 2030: Without the Project; 3) Year 2030: With the Project and With the Transit Corridor; and 4) Year 2030: With the Project and Without the Transit Corridor.

AR00027115

In the Year 2007: Existing Conditions Scenario, the highest worst-case one-hour concentration was predicted to occur during the morning near the intersection of Fort Weaver Road and Renton Road. A value of 12.1 milligrams per cubic meter (mg/m3) was predicted to occur at this location and time. Peak-hour worst-case values at the other locations and times studied for this scenario ranged between 4.6 and 11.0 mg/m3. All projected worse-case concentrations for this scenario complied with Federal standards; however, concentrations exceeded the more stringent State standards at two locations in the Petition Area (Fort Weaver Road at Renton Road and Fort Weaver Road at Old Fort Weaver Road).

In the Year 2030: Without the Project Scenario, the highest worst-case one-hour concentration was predicted to occur during the morning at the intersection of Farrington Highway and Fort Barrette Road. A value of 7.7 mg/m3 was predicted to occur at this location and time. Peak-hour worst-case values at the other locations and times ranged between 3.2 and 7.4 mg/m3. All projected worst-case concentrations for this scenario remained within the State and Federal standards.

In the Year 2030: With the Project and With the Transit Corridor Scenario, the highest worst-case one-hour carbon monoxide concentration was predicted to occur during the morning at the intersection of the North-South Road and Farrington Highway. A value of 8.2 mg/m3 was predicted to occur at this location and time. Peak-hour worst-case values at the other locations and times ranged between 4.6 and 7.8 mg/m3. All projected worst-case concentrations for this scenario remained within the State and Federal standards.

In the Year 2030: With the Project and Without the Transit Corridor Scenario, the predicted worst-case one-hour concentration continued to remain the same or increase slightly compared to the alternative with the project and with the transit corridor. Peak-hour worst-case values for this scenario ranged between 4.6 and 8.9 mg/m3. Although the predicted concentrations increased somewhat in this alternative, the values remained within the State and Federal standards.

Several assumptions were made concerning both traffic movement and worst-case meteorological conditions in this air quality analysis. The analysis assumed a wind speed of one meter per second with a steady direction for one hour will occur. A steady wind of one meter per second blowing from a single direction for an hour is extremely unlikely and may occur only once a year or less. With wind speeds of two meters per second, for example, computed carbon monoxide concentrations would be only about half the values given above.

Based on the air quality modeling results, worst-case carbon monoxide concentrations in the future with the project should be lower (better) than the existing levels and within the Federal and State standards.

AR00027116

Depending on the demand levels, long-term impacts on air quality are also possible due to indirect emissions associated with a development's electrical power and solid waste disposal requirements. Based on the estimated demand levels and emission rates involved, any impacts will likely be negligible.

4.5 MAN-MADE HAZARDS

Existing Conditions

The Petition Area was historically in sugar cane cultivation until relatively recent times. The only known man-made hazardous site related to sugar cane cultivation in the vicinity was a fertilizer/pesticide mixing plant located on the adjacent DHHL property, and not within the Petition Area.

The State of Hawaii Department of Health (DOH) currently assesses the potential of hazards of former agricultural lands on human health based on known historic uses.

Anticipated Impacts and Mitigation Measures

On March 13, 2008, in an interdepartmental memorandum from the DOH Hazard Evaluation & Emergency Response Office (HEER) to the DOH Environmental Planning Office, HEER wrote: "The land under consideration for development of the Ho'opili Project mixed residential/commercial community was formerly used to grow sugar cane. The Draft EIS acknowledges the presence of potential contamination, and investigative work is being coordinated with the HEER Office." The Petitioner is working with DOH on a sampling methodology to determine the presence and levels of certain pesticides. Subsequent actions will be based on the results of the sampling.

Based on sampling done on the adjacent DHHL property, no impacts from pesticide use on the former sugar cane cultivation of the Petition Area are anticipated. Since the Ewa Plain was once mostly under sugar cultivation and large areas have subsequently been developed for residential use without any apparent ill effects, it is anticipated that future residents in the Petition Area will not be exposed to unacceptable levels of pesticides from past or present agricultural activities. During the public review period, the HEER recommended that soils be tested for residual pesticide contamination and that the presence of potential hazards be evaluated. The scope of the investigative work is currently being coordinated with the HEER Office to ensure that the study will be carried out in the most efficient and effective manner possible.

AR00027117

4.6 VISUAL RESOURCES

Existing Conditions

The Petition Area is located in 'Ewa (the area roughly bounded by the H-1 Freeway to the north, Kapolei Golf Course, Kapolei Middle School and the Villages of Kapolei to the west, 'Ewa Villages to the south, and Honouliuli and Fort Weaver Road to the east). Most of 'Ewa is mostly open and is being cultivated. The major man-made features in 'Ewa besides roads (such as Farrington Highway and the North-South Road – under construction) are HECO's transformer station along Farrington Highway and its overhead 138kV powerlines and supporting tower structures crossing the H-1 Freeway, and running along Farrington Highway and North-South Road.

As is the case with the rest of 'Ewa, Parcels A, B and C of the Petition Area are presently undergoing various forms of diversified agriculture. A portion of the Petition Area is being developed during the construction of North-South Road (construction on-going). Views of the Wai'anae Mountains and Diamond Head are offered from certain locations of the project site. However, since most of the Petition Area is being actively cultivated, the public does not have the opportunity to experience these views. The most heavily traveled roadways in the vicinity of the site are the H-1 Freeway and Fort Weaver Road. In fact, as DPP noted in their comments on the EISPN, the *Ewa Development Plan* Open Space Map shows that "panoramic views" of the property are available from these roadways. While nearly all of the Petition Area is lower in elevation than the H-1 Freeway, views makai from H-1 Freeway are infrequent along the stretch of the freeway between where Kunia Road and Palehua Road cross the freeway. In some sections of the H-1 Freeway, it appears that the freeway was cut across slopes and/or the makai shoulder of the freeway was graded with berms. At posted freeway speeds of 60 miles per hour, viewing the Petition Area while driving is hazardous.

Most of the Petition Area is higher in elevation than Fort Weaver Road, but lower in elevation than the H-1 Freeway.

The most visible portion of the Petition Area from either the H-1 Freeway and/or Kunia Road/Fort Weaver Road is located near the intersection of the H-1 Freeway and Kunia Road or from Farrington Highway.

Anticipated Impacts and Mitigation Measures

The visual appearance of the Petition Area as well as the rest of 'Ewa (including the Kroc Center, UHWO and DHHL East Kapolei Development Parcel 2) will change from vacant scrub and cultivated vegetation to a landscaped mixed-use community with parks and open space. The HHCTC project, a possible transit maintenance and storage facility, transit-oriented development, project landscaping, and the project's architectural design will set the visual character of the Petition Area.

AR00027118

Field visits were conducted from various points along the H-1 Freeway and Fort Weaver Road where "panoramic views" have been identified in the *Ewa Development Plan* Open Space Map.

West Loch Golf Course presents a large stretch of open space on the western side of Fort Weaver Road and views of the Ho'opili development (which will be at a higher elevation than Fort Weaver Road) will be available along this portion of the Fort Weaver Road, although the proposed Ho'opili development will be approximately 2,000 feet away. Planting trees along the eastern edge of the Petition Area will provide a landscaped character of the Ho'opili project, and serve to mitigate visual impacts along Fort Weaver Road.

Currently, when traveling from the Wai'anae direction of the H-1 Freeway near Exit 5 (East) Kunia Road/'Ewa/Waipahu, drivers have an unobstructed panoramic view towards the Ko'olau Mountains, Pearl City, Pearl Harbor, 'Ewa and the Pacific Ocean. The Petition Area, which will be located at a lower elevation than the freeway, will be visible from the freeway; and the visual character will change from open space to a planned development community. However, drivers' views towards the Ko'olau Mountains, Pearl City, Pearl Harbor, 'Ewa and the Pacific Ocean will likely remain unobstructed.

When traveling from further west along the H-1 Freeway, views towards the project site vary as certain segments of the H-1 Freeway contain berms and dense vegetation that obstruct views. While nearly all of the Petition Area is lower in elevation than the H-1 Freeway, views makai from H-1 Freeway are infrequent along the stretch of the H-1 Freeway between where Kunia Road and Palehua Road cross the H-1 Freeway. One unobstructed viewing opportunity will be the stretch of the H-1 Freeway crossing Honouliuli Gulch. Since the Petition Area will be located at a slightly lower elevation than the H-1 Freeway, this portion of the Ho'opili project will be highly visible. Careful attention to the architectural character and landscape architectural design of this portion (and the remainder) of the Petition Area will mitigate the impacts to existing views.

4.7 SOCIAL-ECONOMIC CHARACTERISTICS

A Social Impact Assessment for the Petition Area was conducted in November 2007 by Belt Collins Hawaii Ltd. This report is included in Appendix I. A Market Assessment for the Petition Area was conducted in March 2007 by Mikiko Corporation. This report is included in Appendix J. In addition, an Economic and Fiscal Impact Assessment for the Project was conducted in August 2007 by Mikiko Corporation. This report is included in Appendix K.

AR00027119

4.7.1 History of the Ewa Development Plan Area

Prior to the 1970s, the island economy depended on a mix of tourism, military activity, construction, and plantation agriculture. In Ewa, the roles of the military and plantation agriculture in the region's economy has declined (Barbers Point Naval Air Station and Oahu Sugar Company). For the region surrounding Ho'opili, this evolution of the region's economy has been important.

The Oahu Sugar Company, which had used much of the 'Ewa Plain for sugar cultivation, ceased operations by 1995. The land became available for urban development, families in Waipahu and 'Ewa Villages lost a major source of income, and many older workers retired. 'Ewa became a truck farming area using the land and water released from sugar cultivation, with Aloun Farm, Inc. emerging as the island's leading producer of vegetables. The Kapolei area was designated as O'ahu's "Second City" decades ago. James Campbell Industrial Park was created as the island's leading heavy industrial area. The industrial park has seen significant recent growth, including construction of a new Honolulu Advertiser printing plant. The Kapolei urban center was slower to develop but has boomed since 2000. Commercial and residential areas began to be built in the 1990s. In addition, Kapolei has office buildings that accommodate State, City, and the private sector workers, as well as extensive retail areas. The major landowner in the region, James Campbell Company LLC, reports nearly 25,000 jobs in the area, expecting that number to grow to about 65,000 by 2025. Kalaeloa Harbor (formerly Barbers Point Harbor), a deep draft harbor, is nearby. The harbor and the Industrial Park are included in Foreign Trade Zone No. 9.

The Kapolei urban center was slower to develop but has boomed since 2000. Commercial and residential areas began to be built in the 1990s. Located within the *Ewa Development Plan Area*, Ko 'Olina now includes a hotel, a time share resort, high-end vacation homes and condos; a marina has been built and is in use. Residents are now served by a public library, local police and fire stations, a satellite city hall office and other governmental agencies. There is a variety of housing types in 'Ewa, including senior housing, as well as public and private schools and preschools. 'Ewa has one of O'ahu's largest private recreation area, Hawaiian Waters Adventure Park, in addition to community parks and golf courses. The City's transit plans call for a fixed guideway alignment serving the 'Ewa area.

4.7.2 Population

Existing Conditions

According to the City and County of Honolulu Department of Planning and Permitting (DPP), the year 2006 population of the *Ewa Development Plan* Area (Ewa DPA) was 86,000 (DPP, 2006). This comprised an increase of 25.1 percent from its 2000 population of 68,718. The DPP expects the population of the Ewa DPA to increase to 180,200 by the year 2030. In comparison, the population for the City and County of Honolulu as a whole

AR00027120

increased only 3.8 percent from 876,156 to 909,863 between 2000 and 2006. The City and County of Honolulu is expected to experience a population growth of 27.5 percent (241,144 persons) from 876,156 to 1,117,300 total residents during the same 30-year period.

The Petition Area is presently undeveloped and contains cultivated fields for diversified agriculture, pasturage, and agricultural research, and fallow fields formerly used for sugar cane cultivation. There are no residents currently residing within the Petition Area.

Anticipated Impacts and Mitigation Measures

The Ho'opili project will provide up to 11,750 units. Assuming the O'ahu 2000 average size of households of just less than 3 persons per household, the Ho'opili project would have an overall population of approximately 35,290 residents. The majority of the population moving into the Ho'opili project is expected to come from O'ahu residents relocating from other areas of the island. By 2030, employment opportunities at the project are projected to increase in-migration to the island of O'ahu by approximately 2,170 residents, with 1,020 residents from out-of-State. In addition, its residential opportunities could attract some 660 new county residents of which 430 might also be new to the State.

'Ewa has been identified as a development plan area into which new housing and population are to be encouraged. The population increase is therefore consistent with the City and County of Honolulu's policy to direct future growth to this region. With the population of the Ho'opili project mainly consisting of O'ahu residents that have relocated from other parts of the island, this increase in population has already been incorporated into the City and County of Honolulu's growth projection, and as such, no mitigation measures are foreseen for the proposed project.

4.7.3 Housing

Existing Conditions

A Market Assessment for the Petition Area was conducted in March 2007 by Mikiko Corporation. This report is summarized below and included in Appendix J.

Currently, O'ahu is experiencing a shortage of suitable housing units, with an estimated pent-up demand for approximately 17,000 units. Based on projected growth patterns, O'ahu will need more about 98,000 more housing units by the year 2030, including the 17,000 currently estimated as pent-up demand.

Anticipated Impacts and Mitigation Measures

Over the next 20 years, the Ewa DPA is expected to experience a faster growth rate than any other area of O'ahu. The Ewa DPA accounted for 20,797 housing units in 2000 and

AR00027121

the housing supply is projected to triple by 2030 to 60,552 housing units. By 2000, its residential areas were largely inhabited by young families. In the newer subdivisions, home ownership is much higher than for O'ahu as a whole, but the rental inventory for low-income families in 'Ewa remains low. To accommodate the projected growth, 34,600 housing units will be needed in this DPA between 2000 and 2025. With most of O'ahu's new housing stock being planned for development in the 'Ewa and Central O'ahu regions of the island, this trend is expected to continue over the next several decades to accommodate the anticipated population growth and housing demand on O'ahu. The 'Ewa region offers the island's major opportunity for home ownership at relatively reasonable prices because of lower land costs. The Ho'opili project will provide up to 11,750 housing units which could represent a partial solution to O'ahu's current housing shortage.

O'ahu is also experiencing a need for housing for middle-income families. By developing new housing for the middle-income group, Ho'opili responds to that need. Moreover, new housing construction will help to limit price increases for both new and resale housing by increasing new housing stock.

The majority of Ho'opili's 11,750 residential units would consist of for-sale multi-family homes. The Project will also include for-sale single-family units and multi-family rental units. Ho'opili's single-family units would be developed at approximately 5- to 8-units per net acre. Multi-family units will range from low-rise townhome units at approximately 10- to 14-units per acre, to mid-rise development at 30- to 50-units per acre.

The proposed housing will be in neighborhoods that integrate low- and medium-density or medium- and high-density residential areas. As a result, Ho'opili will cater to a range of income levels. In accordance with the City and County of Honolulu's affordable housing guidelines, up to 30 percent of the total number of units are expected to be developed as affordable housing units. Details of the affordable housing program in the Ho'opili project that pertain to the regulations and programs of the City and County of Honolulu will be coordinated with the County prior to development.

Affordable housing unit pricing will need to be coordinated with City and County of Honolulu departments, as pricing will be based on then-prevailing County rules and market conditions. The project is in the planning process so there may be an opportunity to identify a few house lots throughout the proposed project for the development of group homes for persons with special needs.

Ho'opili may be compared to Hawai'i Kai and Mililani, planned communities that have become home to thousands of O'ahu residents who, as they age, choose to grow older within their communities rather than move to other neighborhoods. In addition to home ownership opportunities, the project will provide commercial, educational, and recreational opportunities which will enable residents the opportunity to live, work, learn, play, and shop within the community.

AR00027122

4.7.4 Economic Impacts

Existing Conditions

Presently, the Petition Area generates revenue in the form of rent from Aloun Farm Inc., Sugarland Farms, Inc., Rocker G. Livestock, Larry G. Jefts, Garst Seed Company, Roberts Hawaii, School Bus, Inc., and the Hawaii Agricultural Research Center; sales taxes from the sale of produce; and income taxes from employees of the various lessees. The current approximate annual real property tax revenue paid to the City and County of Honolulu for the Petition Area is approximately $51,000.

Anticipated Impacts and Mitigation Measures

The Petitioner estimates that the development of the Ho'opili project will cost approximately $4.6 billion (in Year 2007 dollars), spent over the project timeline of 2009 – 2030.

The Petitioner is committed to provide or finance its share of infrastructure and facility improvements to support the Ho'opili project. The Petitioner continues to coordinate with major planning and development efforts by other regional developers, such as UHWO, DHHL and HCDA. Meetings among regional developers, as well as with County and State agencies, have been held on a regular and frequent basis to discuss the shared infrastructure and facility improvements. The project will require some commitment of State funds and resources. The State and County will have to extend additional public services for the proposed project, these include: repair and maintenance of roads, water systems, sewer systems, drainage systems and parks; transit, police, fire protection and emergency medical services; and schools.

The cost of the aforementioned public services will be offset by the revenues to the State and County that will be generated by the project. During construction, the project will generate excise taxes via the sale of building supplies and equipment, and on professional services. It will also generate income taxes from those involved in the construction of the project. At full build out, the project will include the development of residential, commercial, and industrial land that will generate property taxes and sales taxes each time a property is resold. The project will perpetually generate income, conveyance, and other taxes for the State, and property and other taxes for the County.

The project's most significant fiscal impact would be the higher real property taxes that would be generated compared to those currently paid. In Year 2007 dollars, the Ho'opili project is projected to generate an additional $7.7 million in real property tax revenues in 2015, or $29.1 million on an annual basis upon the project's completion in 2030. These real property tax collections will continue after 2030.

AR00027123

In addition to real property taxes, the City and County of Honolulu obtains liquid fuel, utility franchise, motor vehicle weight, and other license and permit fees from residents and businesses. The Ho'opili project anticipates approximately $0.6 million in additional City and County of Honolulu revenues by 2030. Also upon completion, the project could generate approximately $2.1 million per year in additional Gross Excise Tax revenues to the State. As illustrated in Exhibit 5-2 of Appendix K, additional taxes earned by the City and County of Honolulu as a result of the Ho'opili project are estimated at $8.7 million in 2015, or $31.1 million per year by 2030 and thereafter.

4.7.5 Employment

Existing Conditions

The civilian workforce in the Ewa DPA was modest in 2000, totaling about 15,000 employees. With the closure of the Naval Air Station (NAS) Barbers Point, the largest job cluster in the Ewa DPA was in education and health services. Since then, the island economy has grown steadily. The island of O'ahu and the State of Hawai'i have emerged with much lower unemployment rates compared to the rest of the nation. Unemployment continues at very low rates (2.6% as of September 2007) and state tax revenues grew by 11% in FY2006 compared to the previous year. The healthy economy is visible in new store openings, construction in industrial areas, and investment by U.S. mainland real estate investors in industrial and commercial properties in the region.

Presently, the Petition Area produces employment and income in the form of short-term agricultural and other leases. Sugarland Farms and Aloun Farm, Inc. hold the major leases on portions of the Ho'opili property and sublease to additional farmers growing mainly truck crops that are sold in Honolulu markets.

Anticipated Impacts and Mitigation Measures

As development proceeds, existing agricultural operations will have to relocate off-site. Eventually, approximately 80 agricultural-related jobs and $1.7 million per payroll will be ultimately be lost from the Petition Area, but the jobs and the agricultural operations will likely relocate to other locations on O'ahu, which has many other acres of former sugar cane and pineapple lands. Moreover, many more employment opportunities will be gained in different job sectors.

According to projections by Decision Analysts Hawaii, Inc. job growth in the Kapolei region will increase by nearly 160% over the next 20 years. Since the 2000 Census, jobs in the Kapolei region grew by 32 percent to nearly 25,000 in 2005. Reflecting the enormous growth that is expected to drive Kapolei's planned expansion, the projections show that jobs will increase to nearly 65,000 by 2025. The project will generate direct, indirect, and induced jobs both within the Petition Area and on an island-wide basis. These jobs will occur both during construction and after construction as operational employment.

AR00027124

The project is expected to generate approximately 66,600 full-time equivalent (FTE) person-years of development related jobs during the construction phase of the project. The project will generate direct jobs via on-site retail and office facilities at Ho'opili's business park. Excluding those jobs that may relocate to Ho'opili from elsewhere in the State, approximately ~~680~~ 1,550 net new jobs are expected to be created (by 2030) through direct employment associated with the project. In addition, the project will generate indirect jobs via the supply of goods and services. Applying State employment multipliers to the project, approximately 870 jobs will be created through indirect employment associated with the project.

At full build out, employment associated with the Petition Area ~~employment~~ is expected to account for approximately 7,000 ~~1,550 net~~ new jobs. Consistent with the Ewa DP and the *Kapolei Area Long Range Master Plan*, the new jobs will generate employment in 'Ewa to reduce the need for residents traveling to downtown Honolulu for work-related purposes.

4.8 INFRASTRUCTURE AND UTILITIES

Within the Petition Area, there are no significant on-site infrastructure facilities (such as a water reservoir or a wastewater treatment plant). Extensive on-site and off-site improvements will be made, including roadways; water storage and transmission facilities; wastewater collection lines, and electrical/communication systems. Bills Engineering Inc. prepared preliminary engineering and drainage reports for the proposed project. Key elements of the reports are summarized in the following sections.

4.8.1 Transportation

A traffic impact analysis report (TIAR) for the project was prepared by Wilbur Smith & Associates (WSA) in February 2008 to identify existing traffic conditions. This report is included in Appendix L.

Existing Conditions

Existing Roadways

The following provides a brief discussion of the existing regional roadway network in the vicinity of the Petition Area.

H-1 Freeway (H-1) (State-owned/maintained). H-1 stretches east-west through Central Honolulu and the 'Ewa District. It provides connections of the Petition Area to areas outside of 'Ewa. East of the Waiawa interchange, it provides five lanes of travel in each direction. Between the Waiawa and Kunia interchanges, the freeway provides four lanes

AR00027125

of travel in each direction. West of the Kunia interchange, the freeway has three travel lanes in each direction.

H-2 Freeway (H-2) (State-owned/maintained). H-2 extends north-south through Central O'ahu and connects to the H-1 Freeway. It provides four lanes of travel in each direction from Waiawa interchange to Mililani, where it narrows to two lanes of travel in each direction.

Farrington Highway (City-owned/maintained). Farrington Highway extends east-west, parallel to the H-1 Freeway, and provides access to the Petition Area. It provides four lanes of travel in each direction from the Kamehameha interchange to Old Fort Weaver Road. Farrington Highway extends westward with one travel lane in each direction to the Villages of Kapolei where it widens to provide two lanes of travel in each direction from Kapolei Golf Course Road into the City of Kapolei. Farrington Highway provides one travel lane in each direction in the vicinity of the Petition Area. The City and County of Honolulu has plans for the widening of Farrington Highway to two lanes in each direction with a right-of-way width of 100 feet between the Kapolei Golf Course and Fort Weaver Road. The widening of Farrington Highway has long been planned and is a transportation facility on the Oahu Regional Transportation Plan (ORTP).

Kamehameha Highway (State-owned/maintained). Kamehameha Highway extends north-south to accommodate traffic traveling from the north and south shores of O'ahu. It is a four-lane highway, with separate left- and right-turn lanes at Waipahu Street, Lumi'au'au Street, Lumi'aina Street, Waipi'o Uka Street, and Ka Uka Boulevard intersection.

The following provides a brief discussion of the existing local roadway system in the vicinity of the Petition Area.

Fort Weaver Road (State-owned/maintained). This roadway extends north-south, connecting the H-1 Freeway with the Farrington Highway. North of Farrington Highway, Fort Weaver Road becomes Kunia Road. Fort Weaver Road serves as a six-lane expressway between the H-1 Freeway and Laulaunui Street. The roadway serves as a four-lane main arterial roadway with a median divider and left turn lanes at cross streets from Farrington Highway to North Road. This road is currently undergoing a widening project.

Fort Barrette Road (City-owned/maintained). This roadway extends north-south, connecting the Kalaeloa Redevelopment Area and Makakilo, and provides access to Farrington Highway and H-1 Freeway. Makai of Farrington Highway to Franklin D. Roosevelt Avenue, Fort Barrette Road serves as a two-lane divided roadway. Mauka of Farrington Highway, it serves as a four-lane divided roadway.

AR00027126

Old Fort Weaver Road (City-owned/maintained). This two-lane roadway provides access to Farrington Highway and Fort Weaver Road.

Laulaunui Street (City-owned/maintained). This four-lane minor arterial roadway extends east-west between Kaihuopalai Street and Laulaunui Lane.

Leokū Street (City-owned/maintained). This two- to four-lane minor roadway extends north-south between Waipahu Street and Leokane Street.

Kunia Road (State-owned/maintained). This roadway is an extension of Fort Weaver Road north from Farrington Highway and the H-1 Freeway Interchange to provide access into Central O'ahu.

Kupuna Loop (City-owned/maintained). This four lane looped arterial roadway provides direct access with Kunia Road at both its origin and terminus.

Renton Road (City-owned/maintained). This two- to four-lane minor arterial roadway extends east-west, connecting Fort Weaver Road, Kapolei Parkway and Franklin D. Roosevelt Avenue.

Roads Under Construction

The State Department of Transportation is constructing the North-South Road along the eastern boundary of the UHWO campus site. With a 128-foot right-of-way, North-South Road will include three vehicular lanes with paved shoulders in each direction, a 28-foot-wide median that could accommodate an exclusive transit corridor, and sidewalks on both sides of the road. A new interchange with the H-1 Freeway is currently being constructed. North-South Road will connect the 'Ewa Beach and 'Ewa Marina areas with the H-1 Freeway (requiring the completion of 0.7 miles of Kapolei Parkway through Varona Village).

Public Transit

Oahu Transit Services, Inc. under contract to the City and County of Honolulu provides TheBus fixed-route service to the communities adjacent to and in the general vicinity of the proposed Ho'opili project. These routes include both suburban trunk routes and express routes. TheBus operates seven bus lines that directly serve the proposed Project and its immediate vicinity. In addition, TheBoat provides express ocean-bound ferry service between Kalaeloa and Honolulu Harbors. The existing public transit system and proposed improvements are discussed in more detail in Section 4.9.6 of this Draft EIS.

AR00027127

Existing (2006) Traffic

Currently, neither the City and County of Honolulu nor the State of Hawai'i have guidelines for identifying the transportation impacts caused by a project. However, WSA consulted with DOT Highways Division, DTS and DPP Traffic Branch on the methodology for the TIAR. For the purposes of this TIAR, certain thresholds were identified to analyze the project's transportation impacts at intersections, freeway segments and ramp-freeway junctions in the vicinity of the Ho'opili project. These guidelines are presented below.

Intersections

- A project would cause a transportation impact at an intersection if it degrades the Level of Service (LOS)[1] of the intersection LOS to E or worse (with A being the best and F being the worst).
- A project would cause a transportation impact at an intersection operating at LOS E or F if it degrades the volume-to-capacity ratio of the intersection by more than 10 percent.

Freeway Segments

- A project would cause a transportation impact at a freeway segment if it degrades the LOS of the freeway segment to LOS E or worse.

Ramp-Freeway Junctions

- A project would cause a transportation impact at a ramp-freeway junction if it degrades the LOS of the ramp-freeway to LOS E or worse.

Existing (2006) Intersection Operating Conditions

Existing intersection operating conditions in the vicinity of the project were conducted in April 2006. The AM peak hour of traffic occurred between 6:00 AM to 8:00 AM, and the PM peak hour of traffic occurred between 3:00 PM to 5:00 PM, respectively. A total of 12 intersections were analyzed of which nine are signalized, and three are Two-Way Stop-Controlled (TWSC) intersections. Under existing AM peak hour conditions, 7 of the 12 intersections operated at what the traffic engineering consultant considers an acceptable Level of Service (LOS) D or better.

Similar to the AM peak hour conditions, the existing PM peak hour conditions reveal that five intersections operate at an unacceptable LOS E or F.

---

[1] Operations of the study intersections were evaluated using Level of Service (LOS) calculations. LOS is a qualitative description of the performance of an intersection based on the average delay per vehicle. Intersection levels of service range from LOS A, which indicates free flow or excellent conditions with short delays, to LOS F, which indicates congested or overloaded conditions with extremely long delays. LOS for signalized intersections was calculated using the Highway Capacity Manual 2000 (HCM 2000) methodology. The LOS is based on the average delay (in seconds per vehicle) for the various movements within the intersection. A combined weighted average delay and LOS are presented for each of the signalized intersections. The average delay for signalized intersections was calculated using the Synchro analysis software.

AR00027128

Existing (2006) Freeway Segment Operating Conditions

Roadway and traffic control information was obtained during AM and PM peak hours of traffic for 10 existing freeway segments on April 2006. Existing mainline freeway characteristic including the number of lanes, volumes, and posted speed limits were used to calculate the levels of service. The results of the existing freeway segment analysis using *Highway Capacity Software* (HCS) indicate that under existing AM peak hour conditions, 9 of the 10 freeway segments operate at what the traffic engineering consultant considers an acceptable LOS D or better. Freeway segment, H-1 Eastbound (west of Pāiwa Street) operated at an unacceptable LOS E.

Under existing PM peak hour conditions, 8 of the 10 freeway segments operate at what the traffic engineering consultant considers an acceptable LOS D or better. Freeway segments, H-1 Westbound (west of Pāiwa Street) and H-1 Westbound (east of Kamehameha Highway) operated at an unacceptable LOS E.

Existing (2006) Ramp-Freeway Junction Operating Conditions

Roadway and traffic control information was obtained during AM and PM peak hours of traffic for existing ramp-freeway junctions on April 2006. Similar to the existing freeway segment analysis, HCS software was used to analyze the operating conditions of the existing ramp-freeway junctions. Under existing AM peak hour conditions, four ramp-freeway junctions operated at what the traffic engineering consultant considers an acceptable LOS D or better.

Under existing PM peak hour conditions, two ramp-freeway junctions operated at what the traffic engineering consultant considers an acceptable LOS C. Ramp-freeway junctions, H-1/Fort Weaver Road (Westbound Off-Ramp) and H-1/Fort Weaver Road (Westbound Loop Off-Ramp), operated at an unacceptable LOS F.

Future Baseline Traffic Conditions (without Ho'opili project)

Full development of the Ho'opili project is expected to occur by 2030. As such, traffic volumes for year 2030 conditions were estimated based on the forecasts provided by the 2030 Oahu Metropolitan Planning Organization (OMPO) Transportation Model. This approach resulted in a cumulative impact assessment for future conditions and other anticipated developments expected by year 2030 near the Ho'opili project (such as UHWO, DHHL East Kapolei Development Parcel 2, and the Kroc Center) plus the expected growth in housing and employment for the remainder of the 'Ewa region. To identify the operating conditions of the future transportation network located in the vicinity of the project, a 2030 Baseline Conditions (without the project) analysis was prepared to compare traffic impacts under with and without project conditions.

The traffic study conducted for the UHWO campus (prepared by PB Americas, Inc.)

AR00027129

indicates that several major roadways would be improved between 2009 and 2025 including: The widening of H-1 Freeway and Farrington Highway, a new North-South Road, a new interchange at H-1 Freeway and connection to the completed Kapolei Parkway. In addition, the 2030 Oahu Regional Transportation Plan (ORTP), mentions that the high-occupancy vehicle (HOV) lanes on H-1 Freeway are planned to be extended from Waiawa Interchange (H-1/H-2 Freeway Merge) to the Makakilo Interchange. Roadway improvements anticipated by Year 2025 include the widening of Fort Barrette Road and Fort Weaver Road, the completion of the East-West Connector Road, and additional internal roadways proposed by Ho'opili and DHHL East Kapolei Development Parcel 1 (See Figure 4.2: 'Ewa Regional Transportation Plan).

The UHWO traffic study also reported that a review of the Ewa Highway Master Plan would include the inclusion of a loop ramp at the North-South Road Interchange. Furthermore, if right-of-way (ROW) is available acceleration and deceleration lanes lengths may be increased. As such, the above improvements were assumed to be in place by 2030.[2]

The Ho'opili project borders Farrington Highway which is a transportation facility on the ORTP. The Petitioner will coordinate with the City and County of Honolulu Department of Design and Construction (DDC) regarding the expanded right-of-way required for the City and County of Honolulu's long-planned widening of Farrington Highway, as well as improvements to the highway (such as turning lanes) which are needed to mitigate traffic that can be directly attributed to the proposed development.

The Petitioner will continue to coordinate with DOT on the planning of the H-1 Freeway/North-South Road Interchange. Bicycle facilities not located within State highway right-of-ways and City and County of Honolulu dedicable roadways will be privately-owned and maintained by a community association.

Projected Intersection Operating Conditions

During the AM peak hour, 17 of the 19 study intersections would operate under what the traffic engineering consultant identifies as acceptable traffic conditions (LOS D or better) (See Table 4.1). Intersections operating at what the traffic engineering consultant identifies as unacceptable traffic conditions (LOS E or worse) include: Fort Weaver Road/Renton Road and Farrington Highway/Fort Barrette Road. During the PM peak hour, 16 of the 19 study intersections would operate under what the traffic engineering consultant identifies as acceptable traffic conditions (See Table 4.2). The traffic engineering consultant identified the following intersections as operating at unacceptable traffic conditions: Fort Weaver Road/Renton Road; Farrington Highway/West Old Fort Weaver Road; and Farrington Highway/Fort Barrette Road.

[2] Based on feedback from DOT, 1) A Diamond (not a "clover leaf") interchange is being planned at the North-South Road/H-1 Interchange; and 2) The WSA traffic analysis did not assume that the loop ramp will be in place by 2030.

Projected Freeway Segment Operating Conditions

During the AM peak hour, 6 of the 10 freeway segments studied would operate under what the traffic engineering consultant identifies as acceptable traffic conditions. During the PM peak hour as well, 6 of the 10 study freeway segments would operate under what the traffic engineering consultant identifies as acceptable traffic conditions (See Table 4.3). Under 2030 Baseline Conditions (without the project), cumulative traffic impacts occur at a total of eight freeway segments.

Projected Ramp-Freeway Junction Operating Conditions

During the AM peak hour, 7 of the 10 ramp-freeway junctions studied would operate under what the traffic engineering consultant identifies as acceptable traffic conditions. During the PM peak hour, 7 of the 10 ramp-freeway junctions studied would operate under what the traffic engineering consultant identifies as acceptable traffic conditions (See Table 4.4). In considering both AM and PM peak hours under 2030 Baseline Conditions (without the project), cumulative traffic impacts occur at a total of six ramp junctions.

Proposed Project

There are several major transportation projects that have been long-planned for 'Ewa. The Ho'opili project has been planned assuming that certain planned transportation projects will be constructed including a portion of North-South Road between Farrington Highway and Kapolei Parkway; a portion of the North-South Road and a new H-1 Freeway interchange; a portion of the intersection of North-South Road and Farrington Highway; the long-planned widening of Farrington Highway fronting Ho'opili; the proposed East-West Connector Road through the Petition Area; and the first segment of the proposed Honolulu High-Capacity Transit Corridor project through the Petition Area.

The Ho'opili project has been planned assuming that the above major transportation projects would be in place. In addition, the Conceptual Land Use Plan reflects the desire for a community that is "complete" with: affordable living options; employment centers; quality schools; shopping, gathering and recreational places; and parks and open space for residents. Implementation of the Plan will allow residents the ability to live, work, learn, play, and shop within Ho'opili, reducing the need to use personal motor vehicles

AR00027135

on regional roadways. Ho'opili's planning consultant, Van Meter Williams Pollack, in consultation with Charlier & Associates, was primarily responsible for the design of Ho'opili's internal roadway system which emphasized Traditional Neighborhood Design principles such as facilitating pedestrian access and connectivity (to UHWO and DHHL East Kapolei Development Parcel 2, and to the above major transportation projects).

To accommodate connectivity, the Ho'opili project would include the construction of numerous internal roadways to accommodate on-site circulation (See Figure 4.3: Internal Roadways). A description of the proposed internal street network is included below.

First Avenue. This east-west avenue connector street runs from Second Avenue to A Street.

Second Avenue. This east-west avenue connector street runs from Fort Weaver Road to Farrington Highway.

Third Avenue. This east-west avenue connector street runs from Fort Weaver Road to Second Avenue.

Fourth Avenue. This east-west avenue connector street runs between Parkway and C Street.

Fifth Avenue. This north-south avenue connector street runs between Parkway and B Street.

A Street. This north-south street runs between First Avenue and East-West Road.

B Street. This north-south street runs between Farrington Highway and East-West Road.

C Street. This east-west street runs between Fort Weaver Road and Parkway

D Street. This north-south street runs between Second Avenue and Farrington Highway.

E Street. This north-south street runs between Second Avenue and Farrington Highway.

Vehicular access to the Ho'opili project would be made possible via multiple entry points. From the north, vehicles would approach the project from the Kunia Road/H-1 Interchange and have access to the site at the intersections of Fort Weaver Road/Second Avenue and Fort Weaver Road/Third Avenue. Access to the Ho'opili project from the south would be provided from the intersections of North-South Road/East-West Connector Road and Fort Weaver Road/C Street. From the west, vehicles would approach the Ho'opili project from the Farrington Highway/North-South Road intersection and gain access to the site at the intersection of Farrington Highway/B Street. From the east, vehicles would have opportunities to enter the Ho'opili project at the following access

AR00027136

points along Farrington Highway: Farrington Highway/Second Avenue, Farrington Highway/West Old Fort Weaver Road and Farrington Highway/East Old Fort Weaver Road.

Due to the size and nature of the Ho'opili project, the Petitioner will coordinate closely with the City and County of Honolulu to identify possibilities for future expansion of the bus service in the vicinity of the project including on the above proposed internal transportation network. This is likely to occur with or without the implementation of the HHCTC project. It is assumed that the locations of bus stops and shelters in relation to schools, commercial and residential facilities in the area will be used to determine appropriate bus stop locations. To enhance connectivity, bus stops should be sited along pedestrian/bicycle paths.

The proposed project has been designed to reduce future residents' reliance on private motorized vehicles through the following measures:

- Ho'opili is the first new project designed to ~~embrace~~ support the City and County of Honolulu's high-capacity transit (elevated, fixed-guideway) corridor and station(s) (and a possible transit maintenance and storage facility);
- the Petition Area is large enough to be designed and offer a full range of mixed land uses, including a wide range of places of live, work, shop, recreate and learn and will aspire to achieve a job-housing balance;
- Ho'opili is designed to maximize connectivity (transit, pedestrian, bicycle and vehicular) with surrounding streets and communities (including DHHL and UHWO), while minimizing cul-de-sacs and dead-end streets;
- Ho'opili will be designed to take advantage of the relative flatness of the site and proximity to UHWO by designing streets and grade-separated multi-modal pathways for walking and bicycling; and
- the Petitioner will seek to implement other transportation management and transportation demand management (TDM) strategies (such as requesting that the State/County consider extending or instituting contra-flow of major transportation corridors during a.m. and p.m. peak travel times).

The most important TDM strategy is that the project is designed to ~~embrace~~ support both rail and bus transit and the project is proposed to have mixed uses over most of the entire Petition Area.

Anticipated Impacts

The City and County of Honolulu is planning for a high-capacity transit corridor project between Kapolei and the University of Hawai'i at Mānoa (UH Mānoa). The Honolulu High-Capacity Transit Corridor Project (HHCTCP) has evaluated transit alternatives for the 23-mile long corridor between Kapolei and UH Mānoa. The City and County of Honolulu will now undertake preliminary engineering and is in the process of preparing the

environmental impact statement for the Locally Preferred Alternative (LPA). As the first project, the City Council selected a minimum operable segment (MOS) that will begin near the Kroc Center on North-South Road to Farrington Highway, through Waipahu, Pearl City, Aiea, and via Salt Lake Boulevard through downtown Honolulu to Ala Moana Center. As of this writing, we understand that the portion of the alignment between the Kroc Center and Waipahu, the location of the transit maintenance and storage facility, and the location of potential transit stations are being finalized.

Two possible HHCTC alignments through Ho'opili have been discussed with at least one station proposed within Ho'opili. If required for the transit project, the Petitioner will coordinate with DTS regarding the possibility of allocating a portion of the project lands for a potential high-capacity transit maintenance and storage facility.

High-capacity transit will be one component of a multi-modal alternative that will provide a balanced transportation system in the Petition Area. The City and County of Honolulu ~~Oahu Transit Service~~ operates TheBus and TheBoat on a supply and demand basis, subject to the availability of resources. Section 4.9.6 contains a more detailed description of transit related issues.

In addition to projecting 2030 Baseline Conditions (without the project), the traffic impact analysis report prepared for the Ho'opili project focused on projecting future transportation conditions with the anticipation of the City's proposed transit corridor project (Scenario A: With Transit Corridor). However, an in-depth analysis of future conditions without the proposed transit corridor project was also conducted to identify additional traffic impact and improvement actions in the event that the proposed transit corridor project does not extend to Ho'opili in 2030 (Scenario B: Without Transit Corridor). Each scenario's ("With Transit Corridor" and "Without Transit Corridor") impacts to "level of service" (LOS) was compared to 2030 Baseline Conditions for AM and PM peak hour intersection operations, peak hour H-1 Freeway segment operations, and ramp-H-1 Freeway junction operations. The three scenarios studied then were:

2030 Baseline Conditions Without (the Ho'opili) Project. Under this scenario, projected future transportation improvements were assumed to be in place by 2030 under without the project conditions. Future traffic volumes were obtained from the Year 2030 Oahu Metropolitan Planning Organization (OMPO) Transportation Model.

2030 Baseline Conditions With (the Ho'opili) Project, Scenario A: With Transit Corridor. Under this scenario, it is assumed that the Honolulu High Capacity Transit Corridor (HHCTC) is constructed and would pass through the Ho'opili project. The presence of a transit corridor within the Ho'opili project would affect the number of vehicle-trips generated by the proposed project land uses. The transit facility would attract an increase in the portion of the person-trips generated from the Ho'opili project; thus increasing the project-related transit trips and reducing the project-related vehicle trips. Thus a transit

AR00027139

reduction factor was applied while developing the project trip generation under this scenario.

The proposed transit alignment would run diagonally through the Ho'opili project along the UHWO Internal Road B, turn down into the median of North-South Road, and stop at the Kroc Center in the median of North-South Road. The median would follow the grass-lined channel of the realigned Kalo'i Gulch. Two transit stations are assumed within Ho'opili, the exact locations of which are still being determined. It should be noted that increased ridership is likely to occur depending on the location of the transit stations, particularly based on the density of the area surrounding the transit station.

2030 Baseline Conditions With (the Ho'opili) Project, Scenario B: Without Transit Corridor. Under this scenario, it is assumed that the HHCTC is either not constructed by 2030 or is not passing through the Ho'opili project. In this scenario, no transit reduction factor was applied while developing the project trip generation.

All of the impacts described for each of the following scenarios assume the cumulative impact of surrounding projects (such as UHWO and DHHL East Kapolei Development Parcel 2), in operation by 2030.

2030 Baseline Conditions With (the Ho'opili) Project, Scenario A: With Transit Corridor – Projected Intersection Operating Conditions

During the AM peak hour, 22 of the 26 intersections studied would operate under what the traffic engineering consultant identifies as acceptable traffic conditions (LOS D or better) (See Table 4.5). During the PM peak hour, 17 of the 26 study intersections would operate under what the traffic engineering consultant identifies as acceptable traffic conditions (See Table 4.6). Out of the four intersections operating at an unacceptable traffic condition during the AM peak hour, all four intersections also operate at an unacceptable level during the PM peak hour. Therefore under Scenario A: With Transit Corridor, the Ho'opili project would result in cumulative traffic impacts at a total of nine intersections during one or both of the peak traffic hours.

2030 Baseline Conditions With (the Ho'opili) Project, Scenario A: With Transit Corridor – Projected Ramp-Freeway Junction Operating Conditions

During the AM peak hour, 7 of the 10 ramp-freeway junctions studied would operate under what the traffic engineering consultant identifies as acceptable traffic conditions. During the PM peak hour, 7 of the 10 ramp-freeway junctions studied would operate under what the traffic engineering consultant identifies as acceptable traffic conditions (See Table 4.8). In considering both AM and PM peak hours, the Ho'opili project would significantly affect traffic conditions at a total of five ramp junctions.

2030 Baseline Conditions With (the Ho'opili) Project, Scenario B: Without Transit Corridor – Projected Intersection Operating Conditions

During the AM peak hour, 20 of the 26 intersections studied, would operate under what the traffic engineering consultant identifies as acceptable traffic conditions (See Table 4.5). During the PM peak hour, 17 of the 26 intersections studied, would operate under what the traffic engineering consultant identifies as acceptable traffic conditions See Table 4.6). Under Scenario B: Without Transit Corridor, in considering both AM and PM peak hours, the Ho'opili project would result in cumulative traffic impacts at a total of 10 intersections operating under unacceptable conditions.

AR00027144

2030 Baseline Conditions With (the Ho'opili) Project, Scenario B: Without Transit Corridor – Projected Freeway Segment Operating Conditions

During the AM peak hour, 6 of the 10 freeway segments studied would operate under what the traffic engineering consultant identifies as acceptable traffic conditions. During the PM peak hour, 2 of the 10 study freeway segments would operate under what the traffic engineering consultant identifies as acceptable traffic conditions (See Table 4.7). Under Scenario B: Without Transit Corridor, the Ho'opili project would result in cumulative traffic impacts at a total of six freeway segments.

2030 Baseline Conditions With (the Ho'opili) Project, Scenario B: Without Transit Corridor – Projected Ramp-Freeway Junction Operating Conditions.

During the AM peak hour, 8 of the 10 ramp-freeway junctions studied would operate under what the traffic engineering consultant identifies as acceptable traffic conditions. During the PM peak hour, 6 of the 10 ramp-freeway junctions studied would operate under what the traffic engineering consultant identifies as acceptable traffic conditions (See Table 4.8). In considering both AM and PM peak hours, the Ho'opili project would significantly affect traffic conditions at a total of five ramp junctions.

Mitigation Measures

To mitigate against traffic impacts, roadway improvements have been identified including: 1) additional traffic lanes at intersections and/or changed usage of existing lanes; 2) by programming an alternate signal timing plans that would be in operation during specified peak commute periods; and 3) by restricting pedestrian crossing on one or more of the intersection approaches in order to allow unconstrained right-turn movement. These proposed mitigation measures were then studied and resulted in the following findings.

Under **Scenario A: With Transit Corridor with Mitigation Measures**, 25 of the 26 intersections studied during the AM peak hour, would operate under what the traffic engineering consultant identifies as acceptable traffic conditions (See Table 4.9). During the PM peak hour, 22 of the 26 intersections studied, would operate under what the traffic engineering consultant identifies as acceptable traffic conditions (See Table 4.10).

Source: Wilbur Smith Associates, Traffic Impact Analysis Report for Ho'opili (2007)

The traffic impacts at these locations are identified under 2030 conditions, and represent increases in cumulative traffic from other developments within and outside the study area. Therefore, the contribution of traffic from the Ho'opili project to cumulative traffic increases should be recognized, and the assignment of traffic impacts should be proportionally allocated. The following locations are proposed for improvement under Scenario A: With Transit Corridor Conditions and Scenario B: Without Transit Corridor Conditions:

AR00027149

- Farrington Highway/Fort Weaver Road~~ch~~ Northbound Ramps;
- Farrington Highway/Leokū Street;
- Fort Weaver Road/Old Fort Weaver Road;
- Fort Weaver Road/Renton Road;
- Farrington Highway/Fort Barrette Road;
- North-South Road/H-1 Eastbound Ramps;
- North-South Road/Farrington Highway; and
- North-South Road/Kapolei Parkway.

Assuming that mitigation measures are implemented, the result of the analysis indicates that the Ho'opili project would result in what the traffic engineering consultant identifies as significant impacts to only one intersection under Scenario A: With Transit Corridor Scenario; this would occur at Farrington Highway/Leokū Street. Under Scenario B: Without Transit Corridor Scenario, a total of three intersections are anticipated to result in what the traffic engineering consultant identifies as significant impacts as a result of the Ho'opili project: Farrington Highway/Leokū Street, Fort Weaver Road/Old Fort Weaver Road and Fort Weaver Road/Renton Road.

One or more of the above mitigation measures may require land from State and County road rights-of-way. This EIS is intended to address the impacts of the proposed project, and in particular, what benefits or costs may result from the proposed action on State and County lands (involving mostly road right-of-ways).

As planned, the directed growth towards/urbanization in 'Ewa will add to traffic on Fort Weaver Road and Farrington Highway through the Project Area.[3] On the other hand, construction of the North-South Road and the H-1 Freeway access associated with the new roadways will help to limit congestion throughout the regional road system. New roads within the project, DHHL East Kapolei Development Parcel 2 and UHWO will provide additional connectivity between Fort Weaver Road and the North-South Road and between the UHWO and DHHL lands to the west and south of Ho'opili and Ho'opili itself.

Before Ho'opili is built, the new H-1 interchange will serve the North-South Road and Farrington Highway. This will be important for trucks to and from the Grace Pacific quarry and plant: they will travel to the new interchange, rather than along Farrington Highway past the Ho'opili site. Accordingly, urbanization along Farrington Highway east of the new interchange will have little or no impact on this truck traffic.

Eventually, rail transit could be built along North-South Road and Farrington Highway, and possibly through Ho'opili. Plans for Ho'opili have been drawn up with transit in mind, even though the exact route and placement of stations is still undecided. With

[3] For detailed quantitative analysis of the project's impact on transportation and traffic congestion, see the Traffic Impact Analysis Report (Wilbur Smith Associates 2007).

AR00027150

transit, the project can further minimize dependence on automobiles by its residents. A comparison of the existing conditions with 2030 Conditions with and without the Ho'opili project can be seen in Table 4.13.

Ho'opili will contribute to the 'Ewa Transportation Impact Fee program, supporting development of local roadways and easing impacts on the existing arterials.

Not factored in the above traffic impact assessment is the potential positive effect of Transportation Demand Management (TDM) strategies.

TDM strategies address traffic congestion by reducing the number of vehicle trips and the amount of vehicle miles traveled, thereby reducing overall travel demand. The aim of these strategies is focused on promoting travel alternatives such as increased transit usage, walking and bicycling to help achieve this goal. The Leeward Oahu Transportation Management Association (LOTMA) currently provides TDM services in the vicinity of the Ho'opili project. It is anticipated that the Ho'opili project will continue to support the existing programs and services in place, as well as consider additional TDM strategies as a means of managing and improving travel demand.

4.8.2 Water Supply Facilities

Existing Conditions

The Petition Area is within the BWS service area. The BWS has a 440-foot elevation system and a 228-foot elevation system. The service limit between the 440 system and the 228 system splits Parcel C of the Petition Area. A 5.0-million gallon (MG) storage tank provides storage for the 228-foot elevation system and this tank is located within Parcel F, adjacent to the H-1 Freeway. A 1.0-MG storage tank provides storage for the 440-foot elevation system and this tank is located within Parcel E, mauka of the H-1 Freeway. A 42-inch transmission line delivers water from the 440 system in Parcel E to the area adjacent to the 228 system in Parcel F. Water from both the 440 system and the 228 system pass makai of the H-1 Freeway via separate transmission lines running through the Honouliuli Gulch crossing under the H-1 Freeway. These transmission lines connect both the BWS 440 and 228 systems to developed lands below the H-1 Freeway. There are also major transmission lines in Farrington Highway corridor. The transmission lines in Farrington Highway include 30- and 36-inch lines.

There is no non-potable water system in the area. However, irrigation water for agricultural lands in the area comes from a battery of wells commonly referred to as EP 5 & 6 located within Parcel C. The average irrigation use is approximately 2.0 to 3.0 million gallons per day (MGD), depending on the time of the year.

AR00027152

Anticipated Impacts and Mitigation Measures

The total average daily source requirement for ultimate build-out is estimated at 3.9 MGD. The future water demand from the proposed project is based on standard civil engineering methodology; it is possible that with the implementation of feasible water conservation appliances, future water demand from the project may be lessened. During the public review period, the BWS wrote: "The developer should also consider rain barrel catchments, water-efficient front- load washer appliances and ultra low-flow toilets." It is intended that source (well supply) would be provided by BWS from existing sources. Although BWS cannot reserve water for future projects, it has indicated that there is water available to meet the estimated water demand for the project (3.9 MGD). Water Facility Charges paid by the Petitioner will be used by the Board to assist in the source replenishment caused by the project's water demands.

New water system demands will require that the Petitioner provide system upgrades to the transmission and storage components to ensure that the system operates effectively and meets BWS standards.

It is proposed to provide water system improvements to meet the Project's water demands and dedicate the improvements to the BWS. The project will require the installation of a 5.5 MG storage tank at the BWS 440 site in Parcel E. A new 24-inch transmission line will be installed parallel to the 42-inch running between the 440 tank site and 228 tank site to allow water to be pumped up to the 440 site. The pump station will be located at the existing 228 reservoir site in Parcel F.

Water for the 228 system will come from the existing 5.0 MG tank at the Honouliuli 228 site just mauka of the H-1 Freeway (Parcel F). The storage requirement for the project (1.5 MG) does not merit construction of a new tank at the 228 site. The project will contribute Facility Charges that will be used for the construction of a new 5.0 MG tank at the Honouliuli 228 site at the appropriate time.

The existing Honouliuli Gulch crossing under H-1 Freeway may not have sufficient capacity for additional transmission lines to carry water to the project boundaries. The Petitioner has requested that the State Department of Transportation (DOT) dispose of real property rights within the State Right-of-Way (ROW) to allow an easement for water use (right to micro-tunnel and installation of a drinking waterline) under and across the H-1 Freeway (See Figure 4.4~~1~~: Preliminary Easement Map). Once construction of the waterline is complete, the waterline easement will be dedicated to the BWS. While the specific nature of improvements is not known at this time, the EIS is intended to address all current and future instances involving the use of State and/or County lands and funds relating to the Ho'opili project.

AR00027153

With respect to non-potable water requirements, the project will be maximizing non-drinking usage to minimize the demand on the safe drinking water system. If a suitable supply is made available, ~~S~~street right of ways of the Ho'opili project will have underground non-drinking distribution systems. It is proposed to upgrade the existing non-drinking source (EP 5 & 6 located within Parcel C) to a BWS dedicable standard to be used as the source for the non-drinking system. It is also proposed to ultimately allow for future dedication of the non-drinking system. It is estimated that the ultimate non-drinking demand for the project will be approximately 2.1 MGD. The Petitioner will consider the use of drought tolerant/low water use plants and the implementation of xeriscaping principles for landscaping within the Ho'opili project to the extent practicable. The installation of an efficient irrigation system, possibly using drip irrigation, will be considered in the design of the project where feasible. Moisture sensors to avoid the operation of the system in the rain and if the ground has adequate moisture would be incorporated into the irrigation system, where feasible.

Another source of non-potable water is reclaimed water. The Honolulu Board of Water Supply (BWS) entered into the water recycling business in 2000 by purchasing the Honouliuli Water Reclamation Facility. Water recycling of treated wastewater effluent is one element of a broader BWS strategy to protect O'ahu's aquifers and to conserve water resources through conservation and development of new water supplies. Treated effluent from the facility is now irrigating golf courses that were once using brackish water, including West Loch, 'Ewa Villages, Hawai'i Prince, and Coral Creek. The facility is also providing recycled water (at a different level of treatment) to industries at Campbell Industrial Park.

The project will be maximizing the use of non-potable water for irrigation to minimize the impact on the source component of the BWS system. It is proposed that the project's greenbelts, parks and roadway medians use non-potable water for irrigation, if a suitable supply will be available. The BWS Water Resources Division will be contacted regarding the availability of recycled water and other non-potable water supplies. A Conceptual Water Master Plan addressing safe drinking and non-potable water facilities has been prepared and reproduced in its entirety and attached to this EIS as Appendix M ~~will be submitted to~~ for BWS ~~for its~~ review and approval. In addition, construction drawings will be submitted to BWS for its review and approval. During the public review period of the Draft EIS, the DLNR Commission on Water Resource Management requested that "the reuse of storm water and installation of water efficient fixtures be considered" and recommended "the use of xeriscaping and the planting of drought tolerant and salt-tolerant plans to conserve water supplies."

4.8.3 Wastewater Facilities

Existing Conditions

Within the 'Ewa area, sewage is treated by the City and County of Honolulu's Honouliuli Wastewater Treatment Facility (WWTF). The treatment facility is located at the corner of North Hanson Road and Geiger Road, approximately 7,200 feet (1.4 miles) south of Parcel C. The Petition Area is upwind of the Honouliuli WWTF during predominant tradewind conditions. Based on average daily flows, the facility has a primary treatment capacity of 38 million gallons per day (MGD), with future plans to expand to 51 MGD. The primary means of disposal is through a deep ocean outfall with a design capacity of 112 MGD. The facility was recently upgraded (with the Honouliuli Water Reclamation Facility) to produce 10 MGD of R-1 quality effluent, which is suitable for irrigation reuse.

The nearest existing sewer collection system to the Petition Area is the Makakilo Interceptor/Kapolei Interceptor system located along the OR&L railroad tracks. The Department of Hawaiian Homelands (DHHL) is currently extending a collection system component from the Makakilo/Kapolei collection in a northerly direction up the North-South Road alignment to serve its land holdings in the area. The main component of the system currently being built (42-inch sewer) has been oversized to accommodate the Ho'opili project as well as the University of Hawai'i West O'ahu (UHWO) campus. The Petitioner has already contributed $2 million towards the construction and installation of the 42-inch sewer line.

The existing treatment plant capacity of the Honouliuli WWTP is 35 MGD. Current flows are approximately 27 MGD.

Anticipated Impacts and Mitigation Measures

The Ho'opili project will ultimately serve a projected 11,750 homes and commercial and retail space. This translates into an average daily sewage flow rate of 4.35 MGD.

A gravity collection system will be designed to City and County standards and ultimately dedicated to the City and County of Honolulu to serve the project. The point of connection to off-site collection systems will be at the southern boundary of Parcel C and at the common property line with DHHL. DHHL is installing a 36-inch collection system within its East Kapolei project and the collection system has been oversized to receive wastewater from the Ho'opili project (as well as from UHWO).

The Ho'opili project will consist of three sewer zones. Zone 1, located on western side of the project, will gravity flow to the Main Trunk Sewer to Honouliuli WWTP with a design average daily flow of 3.441 MGD and a design peak flow of 9.2 MGD. Zone 2, located adjacent to the east side of Zone 1 and Old Fort Weaver Road, will gravity flow to the proposed Ho'opili sewage pump station, where it will then be lifted to Zone 1. Zone 2

AR00027156

has a design average daily flow of 0.448 MGD and design peak flow of 2.0 MGD. Zone 3 is located on the northeastern corner of the project, and will gravity flow to the Kunia sewage pump station, eventually connecting to the Waipahu sewage pump station. Zone 3 has a design average daily flow of 0.421 MGD and design peak flow of 1.6 MGD.

Two pump stations will be required for the project. One will generally be located at the southeastern end of Parcel C. All sewage from the eastern one-third of Parcel C will flow by gravity sewer to the subject pump station. The pump station will in turn lift the sewage to the gravity flow system on the western potion of Parcel C that ultimately connects to the 36-inch sewer line at the DHHL/Ho'opili boundary.

A second pump station will be required to serve the eastern half of Parcel B. Honouliuli Gulch bisects Parcel B and sewage from the eastern half of Parcel B will be collected by gravity sewer and directed to this pump station. The pump station will lift sewage into the gravity system within Parcel C.

An alternative for the Parcel B pump station is to connect to the existing City and County of Honolulu gravity systems within Farrington Highway corridor and ultimately connect to the Kunia and Waipahu pump stations. If this alternative is utilized there are expected upgrades to the existing gravity systems within Farrington Highway and surrounding streets as well as upgrades to both the Kunia and Waipahu Pump Stations.

Ultimate development of the Ho'opili project will exceed the capacity of the Makakilo/Kapolei Interceptors running along the OR&L railroad tracks. The Ho'opili project will participate in a future project to increase the capacity of the Makakilo/Kapolei Interceptor sewers from the intersection of North-South Road to the Honouliuli Wastewater Treatment Plant (WWTP). Options being explored are a third interceptor or complete replacement of one of the existing interceptors.

Over time the project will result in an increase in wastewater being generated than currently being generated on-site (by agricultural activities). To mitigate this effect, new collection system components consisting of gravity sewer, pump stations and relief sewers will be constructed.

The project will generate additional flow that must be treated at the Honouliuli WWTP. To mitigate the additional burden, the project will participate in the Wastewater System Facility Charge (WSFC) program and contribute funds (based on building permits) to expand the treatment plant. Land is available at the Honouliuli WWTP site to allow for expansion. The ultimate expansion of the Honouliuli WWTP is master planned to treat 51 MGD.

Preliminary contact with the City and County of Honolulu Department of Environmental Services has indicated that the sewer system has the capacity to accommodate the Project

AR00027157

with a build-out beginning in four to six years and ending 15 to 20 years after. The Petition Area has always been within the service limits of the Honouliuli WWTP.

Wastewater collected from the site is eventually treated at the Honouliuli Water Reclamation Facility (WRF). The entire water recycling facility is located adjacent to the City & County of Honolulu's Honouliuli WWTP. Water recycling components include a Reuse Pump Station, a Sand Filter Structure which includes rapid mixing tanks and chemical flocculators, Ultraviolet Light (UV) Disinfection, a Microfiltration/Reverse Osmosis Building, Storage Tanks, and a Product Delivery Pump Station.

The facility currently has a capacity of 12 million gallons per day (MGD) and produces two grades of recycled water. R-1 water is used for irrigational uses, and Reverse Osmosis (RO) for industrial uses. The facility is currently capable of producing up to 10 MGD of R-1 water, which is the highest level of treatment as designated by the State Department of Health. R-1 water is currently used throughout the State of Hawai'i for golf course irrigation, landscaping, and agriculture. On the other hand, RO water is intended strictly for industrial uses such as boiler feed water, cooling tower make-up water, and process water for refineries. The facility currently has an RO capacity of 2 MGD. Both types of recycled water begin with secondary treated effluent from the Honouliuli WWTP.

The Honouliuli WRF currently supplies the City golf courses of West Loch and 'Ewa Villages with 1 MGD each of R-1 water. Recycled water is pumped to the West Loch course at night, while the 'Ewa Villages course is supplied during the day. The pumping rate to each course is 150 gallons per minute (GPM) at a pressure of 68 pounds per square inch (PSI).

All wastewater plans will conform to applicable provisions of Chapter 11-62, HAR, "Wastewater Systems," and the DOH Wastewater Branch reserves the right to review the detailed wastewater plans for conformance to applicable rules. In addition, the Petitioner will work with the Board of Water Supply and utilize recycled water for irrigation and other non-potable water purposes in the open spaces and for landscaping areas to the extent practicable.

4.8.4 Drainage Facilities

Existing Conditions

The Petition Area is within three distinct drainage basins. These are the Kalo'i drainage basin, the Honouliuli Stream drainage basin and the West Loch drainage basin. The Kalo'i Basin stretches to the top of the eastern slopes of the Wai'anae mountain range and terminates near the ocean in the vicinity of Haseko's Ocean Pointe development. The drainage basin mauka of the H-1 Freeway is 3,000 acres and generates a peak flow of 5,000 cubic feet per second (CFS). The drainage basin size increases to 4,330 acres and carries a peak flow of 8,900 CFS at the entrance to 'Ewa Villages. The mauka boundary of Ewa Villages is laterally equal to the southern boundary of Parcel C. Approximately 100

AR00027158

acres of the Ho'opili project are within this watershed. Kalo'i Gulch is characterized on the USGS map as an intermittent stream.

The Honouliuli Stream drainage basin also stretches to the top of the eastern slopes of the Wai'anae mountain range. This basin contains 6,600 acres (11,200 CFS – peak flow) of drainage area mauka of the H-1 Freeway and expands to 7,880 acres (12,300 CFS – peak flow) at its connection with the West Loch of Pearl Harbor. The terminus location is in the vicinity of the West Loch Golf Course. Approximately 635 acres of the Ho'opili project are in the Honouliuli Stream drainage basin.

The West Loch drainage basin is the smallest drainage basin affecting the project. The basin upper reaches begin at the makai side of the H-1 Freeway and generally terminates at two locations at the West Loch of Pearl Harbor. One terminus is through West Loch Estates and the other is an overflow from an existing detention basin located east of Fort Weaver Road and just south of the OR&L railroad tracks (See Parcel D1 on Figure 1.5: Parcels Map). This basin contains approximately 937 acres and generates a peak flow of 2,500 CFS. The total basin is within lands that are part of the Ho'opili project.

Anticipated Impacts and Mitigation Measures

With respect to the portion of the project within the Kalo'i drainage basin, the project will be creating on-site detention basins to collect all storm water runoff and discharge the flow at a rate that will not exceed pre-development conditions. The project will also be providing storage and detention to meet the Rules Relating to Storm Drainage Standards with respect to water quality standards. The basin size could be decreased at some time in the future when the terminus of Kalo'i basin is finalized. All developed projects discharging to the Kalo'i basin currently have discharge restrictions and these restrictions will continue until the Kalo'i basin terminus is finalized. The portions of the project within the Kalo'i drainage basin are Parcels A and the western most part of Parcel C adjacent to the North-South Roadway alignment (See Figure 4.5~~2~~: Drainage Basins). The Petitioner will continue to coordinate with County and State agencies to discuss issues within the Kalo'i Gulch Watershed.

With respect to the Honouliuli Stream drainage basin, the project will provide detention basins to collect all storm water runoff and discharge the flow at a rate that will not exceed the 10-year recurrence flow rate. This is the recognized capacity of the Honouliuli Stream channel. The project will also be providing storage and detention to meet the Rules Relating to Storm Drainage Standards with respect to water quality standards. The portions of the project within the Honouliuli Stream drainage basin are Parcels B and the northeastern part of Parcel C adjacent to Old Fort Weaver Road (See Figure 4.5~~2~~: Drainage Basins).

With respect to the West Loch drainage basin, the project intends to collect all storm water and route it to the existing detention basin located on the east side of Fort Weaver

PBR HAWAII & ASSOCIATES, INC.

Road and south of the OR&L railroad tracks. The routing would require the installation of a concrete channel from the southeastern end of Parcel C, under Fort Weaver Road (using the existing cane haul underpass) and connecting to the existing detention basin. The basin would be expanded to ensure that the water quality storage component of the City and County of Honolulu Standards was achieved. An overflow from the detention basin would discharge to the West Loch of Pearl Harbor (See Parcel D2 on Figure 1.5: Parcels Map). The portion of the project within the West Loch drainage basin is the bulk of Parcel C (See Figure 4.5~~2~~: Drainage Basins).

The overflow from the detention basin would have to cross Navy property and permission from the Navy would be required. Initial inquiries have been made to the Navy to see if the overflow can be negotiated. Issues with the Navy include security and access in a post- "9/11" environment, Navy plans for development in the overflow corridor, and the acquisition of a maintenance commitment by the City and County of Honolulu. The concept of the overflow across Navy property is not new and was approved in concept back in the early- to mid- 1990's. Lack of action and the issues cited above are points that need to be resolved for the overflow option to move forward.

If permitted, the overflow option across Navy property will solve drainage problems occurring on Fort Weaver Road, within West Loch Estates and within portions of 'Ewa Villages by effectively collecting the storm water that currently is misdirected across these properties. However, as of this date, the Navy has rejected any considerations to allow increased runoff to cross Navy land.

The alternative drainage solution if the overflow across Navy property cannot be resolved is to construct retention basins on site holding back the total volume of a 100 year- 24 hour storm. These basins would be located on the southern portion of Parcel C.

The project will increase impervious surfaces such as roadways, roofs, paved parking areas, and sidewalks. These surfaces will cause an increase in storm water discharge within the Petition Area. However, detention basins and/or retention basins are being planned and sited to detain and/or retain storm water to ensure that areas downstream of the project are not impacted. Based on comments received from the City and County of Honolulu Department of Facilities Management during the public review period, storm drainage detention and retention basins within the project site shall be privately-owned and maintained, unless particular parcels of land are dedicated to or acquired by the government. During the public review period, the State Office of Planning requested a discussion of low impact development techniques that can be incorporated into the building and site design to improve stormwater management. Table 1.1 of Low Impact Development: A Practitioner's Guide (2006) lists specific Low Impact Development (LID) best management practices (BMP's) and techniques.

AR00027161

- Preservation of Undisturbed Areas: As recommended, most of the existing undisturbed areas (or uncultivated) areas will be preserved, because the gulches and steeper sloped areas are unsuitable for development. Most of the project area is highly developable, but has been highly disturbed from past and present agricultural cultivation.
- Preservation of Buffers: Naturally vegetated buffers will be defined, delineated and preserved along Honouliuli Gulch.
- Reduction of Clearing and Grading: Clearing and grading of the site will be limited to the minimum amount for the development function, road access and infrastructure.
- Locating Sites in Less Sensitive Areas: Most of the Petition Area is highly developed and does not include sensitive resource areas such floodplains, steep slopes, wetlands, mature forests or critical habitats.
- Open Space Design: While the project will be more densely developed than most of the projects in the Villages of Kapolei or the rest of 'Ewa, this project acknowledges that there are very limited areas on O'ahu left to develop and this will allow other areas in Central O'ahu, North Shore, Ko'olauloa, Ko'olaupoko and Wai'anae to remain undeveloped.
- Roadway Reduction: The proposed traditional neighborhood design and pedestrian-friendly development concept proposes more but narrower roads than a conventional development, to: 1) ensure lower vehicle speeds; 2) enhance pedestrian safety in crossing the streets; and 3) facilitate safer bicycle travel.
- Sidewalk Reduction: The proposed pedestrian-friendly and traditional neighborhood design development concept proposes meeting minimum standards for sidewalks to: 1) enhance greater pedestrian use, and 2) facilitate safer bicycle travel for children and inexperienced adult bicyclists. Impervious surfaces could be reduced by consolidating separate pedestrian and bicycle paths into multi-modal paths.
- Driveway Reduction: The proposed development will strive to minimize driveway lengths and widths to reduce overall imperviousness.
- Cul-de-sac Reduction: The proposed pedestrian-friendly, traditional neighborhood design development concept seeks to avoid cul-de-sacs to increase connectivity within the project and to surrounding communities.
- Building Footprint Reduction: The proposed transit-oriented development concept is not adverse to taller buildings to reduce the impervious footprint of buildings while recognizing the visual appearance of Kapolei.
- Parking Reduction: The proposed mixed-use, pedestrian-friendly and transit-oriented development concept is supportive of reducing the current off-street parking requirements and reducing the overall imperviousness associated with parking lots.
- Vegetated Buffer/Filter Strips: Where feasible, runoff will be directed to open space buffers to treat and control stormwater runoff from developed areas.
- Open Vegetated Channels: Where feasible, properly designed and constructed

AR00027162

vegetated channels will be provided to convey runoff, but it is unlikely that will occur along streets dedicated to the City and County of Honolulu.

- Bioretention and Rain Gardens: Where feasible, bioretention and rain gardens will be provided.
- Infiltration: Where feasible, infiltration trenches, basins or leaching chambers will be provided.
- Rooftop Runoff Reduction Mitigation: Where feasible, runoff will be directed from rooftops to pervious areas.
- Stream Daylighting for Redevelopment Projects: Not applicable because there are no previously-culverted/piped streams to "daylight" to restore natural habitats.
- Tree Planting: The proposed project will include street trees, park landscaping and project landscaping to reduce stormwater runoff and provide shade.

Surface water quality can be impacted through development. Per comments received by the State Department of Health Clean Water Branch, any discharges related to project construction or operation activities shall comply with the applicable State Water Quality Standards as specified in Chapter 11-54, HAR. Further, the DOH Clean Water Branch wrote that the Hawaii Revised Statues, Subsection 342D-50(a), requires that "[n]o person, including any public body, shall discharge any water pollutants into state waters, or cause or allow any water pollutant to enter state waters except in compliance with this chapter, rules adopted pursuant to this Chapter, or a permit or variance issued by the director." The project will need to obtain NPDES permits and Grading Permits (as previously identified in the DEIS). Both required permits have substantial effort identified in their applications specifically addressing BMP issues. The substantive parts of the permitting processes focus on BMP tools and monitoring. Features will include: stabilized gravel entrances, siltation berms, diversion of storm water around work areas, use of detention basins, diversion swales, filter traps at catch basins, calculation of soils losses meeting acceptable levels and monitoring plans. BMP's are an important part of current construction practice. The project will be providing detention basins to meet City and County of Honolulu Standards for water quality treatment. Structural methods may also be used to meet water quality requirements of the Rules Relating to Storm Drainage Standards. Structural methods include the use of Stormceptor® type storm drain manholes.

4.8.5 Solid Waste Disposal Facilities

Existing Conditions

On the island of O'ahu, the majority of residential and commercial trash is disposed of at the Honolulu Program of Waste Energy Recovery (H-POWER) facility, the City and County of Honolulu's waste-to-energy plant located nearby at the Campbell Industrial Park. Approximately 600,000 tons of solid waste is processed annually at the facility, therefore, reducing the volume of solid waste going into landfills by 90 percent. Through a purchase power agreement with HECO, the H-POWER facility provides 46 megawatts (MW) of renewable energy that supplies power to between 40,000 and 45,000 homes on O'ahu on

AR00027163

a daily basis. Presently, H-POWER has two boilers and one turbine/generator. A proposed third boiler would enable H-POWER to supply electricity to 20 percent more homes each year. Ash and non-processibles are transported and buried at the Waimānalo Gulch Landfill.

Waimānalo Gulch Landfill, which opened in 1989, is located northwest of the proposed Ho'opili project. While the land is owned by the City and County of Honolulu, the landfill is operated by Waste Management, Inc. The site accepts ash and residue from the H-POWER facility, industrial wastes, and non-combustible construction and demolition debris. Commercial haulers pay $72.75 per ton to dispose solid waste at the facility. During the public review period, the State Land Use Commission reported that it took action to extend the deadline to close the Waimanalo Gulch Sanitary Landfill to November 1, 2008, and the City and County of Honolulu Department of Environmental Services has plans to expand the landfill by another approximately 92.5 acres.

Anticipated Impacts and Mitigation Measures

~~Solid waste will be generated during construction and operation of the proposed Ho'opili project. The amount of waste generated during construction will vary, depending on various conditions such as the type of construction. Project construction will conform to the guidelines and objectives of Chapter 342G, HRS, *INTEGRATED SOLID WASTE MANAGEMENT*. Construction will also comply with the City and County of Honolulu's approved integrated solid waste management plans in a schedule and time frame satisfactory to the DOH.~~

~~Recycling shall be encouraged within the project including the reuse and recycling of green waste generated during construction clearing and grubbing activities, the use of recycled construction and demolition wastes and the use of materials made from recycled products, the use of locally produced compost as available for landscaping, and the provision of space for recycling bins in the detailed design of the community. As such, a construction waste recycling plan will be prepared before the start of construction.~~

~~According to Popular Mechanics, the approximate municipal solid waste generated per person per day is approximately 4.5 pounds. Assuming an average household size of 3.0 persons, at full build out, the solid waste generated by the project is estimated to average approximately 158,625 pounds per day. It should be noted that this estimate does not account for solid waste that would be recycled, which would be a considerable amount. The goal for waste management is to appropriately reduce, reuse and recycle materials, to minimize generation of solid waste and achieve diversion from landfills. As such, in conformance with Chapter 344-4(2), HRS, the project will promote the optimal use of solid wastes through programs of waste prevention, energy resource recovery, and recycling.~~

AR00027164

~~In the future, the H-POWER plant will need to be expanded or an increased emphasis will need to be placed on recycling to dispose of the solid waste. According to the City and County of Honolulu, approximately 15 percent of residential solid waste is recyclable newspaper, aluminum, glass, and plastic; and 25 to 30 percent is compostable yard trimming. The City and County of Honolulu is restarting its curbside pick-up recycling program. In November, 2007, two pilot curbside recycling programs began in Mililani and Hawai'i Kai. During the six to twelve month evaluation period, the City and County of Honolulu Department of Environmental Services staff will be coordinating plans for islandwide expansion.~~

On March 7, 2008, the State Land Use Commission agreed to allow the City and County of Honolulu's Waimanalo Gulch Sanitary Landfill to remain open for at least 18 more months. The City had sought a 24-month extension, through May 1, 2010.

Waste Management of Hawaii has operated the Waimanalo Gulch Sanitary Landfill as an integral part of the City's solid waste management infrastructure for approximately 20 years. The facility is heavily regulated, monitored and controlled by local, state and federal government agencies.

Before Mayor Hannemann took office, the City Council chose to keep the landfill in its current location, after evaluating a wide range of potential options.

Mayor Hannemann has noted that the recent emergency disposal of 28 tons of recalled beef at the landfill demonstrated that O'ahu will always need such a facility. However, the City and County of Honolulu is striving to decrease the amount of waste that's sent to the landfill, including: expanding the City's curbside residential recycling program; shipping at least 100,000 tons of waste to a mainland facility, and expanding the H-Power garbage-to-energy plant.

According to the U.S. Environmental Protection Agency, in 2006, individuals recycled 1.5 pounds of our individual waste generation rate of 4.6 pounds per day, for a net waste generation amount of 3.1 pounds per day. Assuming an average household size of 3.0 persons, at full build-out, the solid waste generated by the project is estimated to average approximately 109,275 pounds per day. According to the City and County of Honolulu, approximately 15 percent of residential solid waste is recyclable newspaper, aluminum, glass, and plastic; and 25 to 30 percent is compostable yard trimming. In the future, the H-POWER plant will need to be expanded or an increased emphasis will need to be placed on recycling to dispose of the solid waste.

Recycling will be encouraged within the project including the reuse and recycling of green waste generated during construction clearing and grubbing activities, the use of recycled construction and demolition wastes and the use of materials made from recycled products, the use of locally produced compost as available for landscaping, and the

AR00027165

provision of space for recycling bins in the detailed design of the community. As such, a construction waste recycling plan will be prepared before the start of construction.

The City and County of Honolulu is restarting its curbside pick up recycling program. In November, 2007, two pilot curbside recycling programs began in Mililani and Hawai'i Kai. During the six to twelve month evaluation period, the City and County of Honolulu Department of Environmental Services staff will be coordinating plans for islandwide expansion.

On June 27, 2008, the Associated Press reported that Mililani and Hawai'i Kai residents have recycled 54 percent of their cans, bottles, newspapers and green waste during the city's six-month curbside recycling pilot project. City Officials with the City and County of Honolulu Department of Environmental Services (DES) are reportedly satisfied with the results and are moving forward with plans to provide some 160,000 O'ahu homes the curbside recycling service by May 2010. In the new plan, the city will collect garbage and recyclables each once a week. The DES will no longer have garbage pickup twice-weekly. A study released by DES predicts the program will divert an estimated 53,800 tons of mixed recyclables and green waste from O'ahu landfills. They plan to begin expanding the program to more communities in November 2008.

The goal for waste management is to appropriately reduce, reuse and recycle materials, to minimize generation of solid waste and achieve diversion from landfills. As such, in conformance with Chapter 344-4(2), HRS, the project will promote the optimal use of solid wastes through programs of waste prevention, energy resource recovery, and recycling.

4.8.6 Electrical Facilities

Existing Conditions

Electricity for the area is currently provided by the Hawaiian Electric Company, Inc. (HECO). HECO owns and maintains a pole line along Farrington Highway that supports two 138-~~kilo volt~~ kilovolt (kV) lines and one 12.47-kV line (with provisions for a 46-kV line in the future). The pole line runs along Farrington Highway from HECO's 'Ewa Nui Substation to Palehua Road. From the 'Ewa Nui Substation, the 12.47-kV line and a 46-kV line runs along Farrington Highway to the Waipahu Interchange and up Fort Weaver Road. The line also runs along Old Fort Weaver Road to the intersection with Fort Weaver Road. A 12.47-kV line serving the West Loch area, traverses the project site makai toward the Old Fort Weaver Road. Both of the 138-kV lines turn south at Palehua Road and follow the alignment of the future North-South Road to the OR&L right-of-way. Two other 138-kV pole lines from the Kahe Power Plant pass to the north of Parcel A, mauka of the H-1 Freeway. In response to the EISPN, HECO wrote that it has "...existing facilities within the project area that will require continued access for maintenance purposes..." The Petitioner will allow HECO continued access for maintenance purposes. An existing 46-kV circuit that is supported by wood poles follows the alignment of the H-1

AR00027166

Freeway. On the Honolulu-side of Pu'u Makakilo, a spur continues across the H-1 Freeway to the Pacific Concrete and Rock Substation, while the main branch of the pole line continues to parallel the H-1 Freeway alignment and heads toward the 'Ewa Nui Substation.

HECO representatives have provided easement documents and maps of existing HECO facilities that are currently encumbered by the Ho'opili project. These easements will be researched during the preliminary engineering phase of the project to determine whether the affected facility will need to be relocated.

Anticipated Impacts and Mitigation Measures

The project is initially expected to generate an electrical demand of approximately 42 megavolt amperes (MVA) for conventional development. At full build-out, the estimated electrical demand is estimated to be approximately 98 MVA (assuming a diversity factor of 70%). HECO has determined that to serve the ultimate load for the proposed development, three distribution substations, including power lines to and from them, will be needed.

The first distribution substation is proposed to be located mauka of Farrington Highway, between the 'Ewa Nui Transmission Substation and Fort Weaver Road. The second distribution substation is proposed to be located adjacent Ho'opili's main road perpendicular to North-South Road. The third distribution substation is proposed to be located between the North-South Road and the 'Ewa Nui Transmission Substation. The three substations may be relocated from the locations described above based on how development proceeds. Each distribution substation will require at least two 46-kV feeders and one or two transformers, with a third 46-kV feeder and up to four transformers total required for full-build-out of the substation. The new substation sites, each approximately 20,000 square feet in size, will be likely kept at a low profile. HECO will own/maintain the land sited for the distribution substations.

All new primary and secondary distribution lines serving the Ho'opili project will be placed underground to reduce visual impacts.

The installation of power lines and substations may require approval by the State Public Utilities Commission depending if the primary provider of electrical power is HECO or another private utility company, as well as other applicable State and County approvals and permits. In response to the EISPN, HECO wrote that it "...has no objections at this time." Also required is the use of State and County road rights-of-way for the installation of powerlines.

If HECO is primary provider of electrical power, then some of the projected demand would be offset if the solid waste generated daily by the development were burned at the City and County of Honolulu's H-POWER facility. An estimated 59 tons of solid waste

AR00027167

will be produced daily by the development (assuming no recycling), and at 1 MW of electricity per 35 tons of solid waste, approximately 1.67 MW will be generated from the property. Under a purchase power agreement with HECO, the H-POWER facility provides 46 MW of renewable energy that supplies power to between 40,000 and 45,000 homes on O'ahu on a daily basis. A proposed third boiler at the facility would enable H-POWER to supply electricity to 20 percent more homes each year.

HECO is planning to build a 110-megawatt (MW) simple cycle combustion turbine generator power plant in 2009. According to the HECO website, HECO "is looking for companies to supply enough biofuel -- either ethanol or biodiesel -- to fuel HECO's new Campbell Industrial Park Generating Station planned to be in service by mid-2009. HECO reached an agreement with the State Consumer Advocate, subject to approval by the State Public Utilities Commission, to fuel this new 110-megawatt peaking plant with 100-percent, renewable biofuel. "

Based on DBEDT Strategic Industries Division's recommendations, the Petitioner's mechanical and electrical consultants, in consultation with its sustainability consultant, will be directed to review the City and County of Honolulu's Energy Code early in the project and to consult with Hawaiian Electric Company, Inc. (HECO) on demand-side management programs that offer rebates for installation of energy-efficient technologies (including solar power and energy-efficient appliances). During the public review period the State Office of Planning requested discussion of the following: the U.S. Green Building Council's (GBC) Leadership in Energy and Environmental Design (LEED) certification; Hawaii's Green Built, and Zero-Net Energy Green Homes.

U.S. Green Building Council's (GBC) Leadership in Energy and Environmental Design (LEED) Certification - According to the GBC website: "The Leadership in Energy and Environmental Design (LEED) Green Building Rating System™ encourages and accelerates global adoption of sustainable green building and development practices through the creation and implementation of universally understood and accepted tools and performance criteria. LEED is a third party certification program and the nationally accepted benchmark for the design, construction and operation of high performance green buildings. LEED gives building owners and operators the tools they need to have an immediate and measurable impact on their buildings' performance. LEED promotes a whole-building approach to sustainability by recognizing performance in five key areas of human and environmental health: sustainable site development, water savings, energy efficiency, materials selection and indoor environmental quality." Even though State agencies are directed to implement LEED Silver to the extent possible (under Chapter 196 of the Hawaii Revised Statutes), to date, there have only been a couple of projects built by the State of Hawai'i (Imiloa Astronomy Center, Waipahu Middle School Cafeteria, Hawai'i Gateway Energy Center) so certified.

According to the GBC website: "The LEED for Neighborhood Development Rating System integrates the principles of smart growth, urbanism and green building into the first

AR00027168

national system for neighborhood design. LEED certification provides independent, third-party verification that a development's location and design meet accepted high levels of environmentally responsible, sustainable development. Currently in its pilot period, LEED for Neighborhood Development is a collaboration among USGBC, the Congress for the New Urbanism and the Natural Resources Defense Council. The pilot program is no longer accepting projects. The post-pilot version of the rating system, which will be available to the public, is expected to launch in 2009." Ho'opili is part of the LEED-ND pilot program, and it is in the early stages of working with the U.S. Green Building Council (USGBC) to obtain information required to implement LEED-ND to the extent that it is feasible and practicable.

A preliminary overview of LEED-ND features to be incorporated into the development project site include:

In order to reduce the impacts of urban sprawl, or unplanned, uncontrolled spreading of urban development into areas outside of the metropolitan region, and create more livable communities, LEED for Neighborhood Development communities include:

- locations that are closer to existing town and city centers,
- areas with good transit access, and
- sites adjacent to existing development.

LEED for Neighborhood Development emphasizes the creation of compact, walkable, vibrant, mixed-use neighborhoods with good connections to nearby communities (such as UHWO and DHHL East Kapolei Development 2). Research has shown that living in a mixed-use environment within walking distance of shops and services results in increased walking and biking, which improve human cardiovascular and respiratory health and reduce the risk of hypertension and obesity.

LEED for Neighborhood Development also encourages increased transportation choice and decreased automobile dependence. These two things go hand-in-hand; convenient transportation choices such as buses, trains, car pools, bicycle lanes and sidewalks, for example, are typically more available near neighborhood centers and town centers, which are also the locations that produce shorter automobile trips. All of these concepts are being incorporated into the planning of the Ho'opili project.

Hawaii Builtgreen™ Home Program - According to the DBEDT website: "The 'Hawaii BuiltGreen™ Program' is a statewide program to make it easier for builders and homeowners to design and build energy- and resource-efficient homes in Hawaii. It includes hands-on, right-here-in-Hawaii examples of what to do and how to do it, such as a real home, exhibits, seminars, and workshops." According to the Building Industry Association website, there are no Hawaii BuiltGreen™ Award-winning housing projects built by the State of Hawai'i.

AR00027169

Zero-Net Energy Green Homes - According to Wikipedia: "A zero energy building (ZEB) or net zero energy building is a general term applied to a building with a net energy consumption of zero over a typical year. Zero energy buildings are gaining considerable interest as a means to cut greenhouse gas emissions and conserve energy... There are many overlapping similarities between the goals of ZEB and GB [Green Buildings]. However, the subtle differences are significant, but diminishing, as scarce knowledge becomes more widespread."

The goal of ZEB design is the reduction, and eventual elimination of, energy bills and greenhouse gas emissions using potentially complex thermal physics necessary for zero energy design.

It is unlikely that there are any net zero energy housing projects built by the State of Hawai'i.

The Petitioner is also considering the potential use of photovoltaic cells on future project buildings, where practicable. As an example, large national retailers are entering agreements with micro utility companies who arrange for solar power systems financing and sells such systems to the micro utility company's financing partner. In addition, these micro utilities design, install and maintain these photovoltaic systems per each customer's requirements. The customer pays the financing partner for the solar electricity generated over a long-term power purchase agreement. At the end of the term specified under the agreement, the customer typically has the option to renew the agreement, transfer the equipment to a new site, or purchase the system outright from the financing partner.

To reduce energy consumption from the operation of air-conditioners, the Petitioner is considering the installation of chill water lines. While the above two options are alternatives to relying on only HECO for electrical needs, it is possible that these proposed uses may still have a need for transmission line easements within, and the use of, State and County road rights-of-way.

As previously noted, portions of the HECO's 138-kV lines run through the Petition Area, along Farrington Highway and follow the alignment of the future North-South Road to the OR&L right-of-way. These lines are suspended near the tops of large, tall metal poles. According to HECO, the State of Hawaii Department of Health (DOH) recommends a prudent avoidance policy for electric and magnetic fields.

According to a HECO flyer titled Electric and Magnetic Fields (EMF), "[s]tudies disagree on EMF and health effects," therefore, HECO "designs and builds facilities to minimize EMF consistent with DOH's EMF policy[.]" Since coordination with HECO is required in designing future buildings within the Petition Area, EMF concerns will likely be addressed.

AR00027170

4.8.7 Telephone/Communication Facilities

Existing Conditions

Hawaiian Telcom, which provides telephone service to the area, owns and maintains a pole line along Farrington Highway, Old Fort Weaver Road and Kunia Road. This pole line is substandard; however, Oceanic Time Warner Cable and Pacific Lightnet have an agreement with Hawaiian Telcom for use of its poles and have attached cables to extend their facilities to Kapolei. AT&T has a fiber cable buried within the southern shoulder of the existing Farrington Highway right-of-way. In addition, the Federal government owns a buried joint tactical support cable within the Farrington Highway right-of-way.

Anticipated Impacts and Mitigation Measures

The project will increase the demand for telephone/communication service in the 'Ewa region. If Hawaiian Telcom and Oceanic Time Warner Cable are the selected providers, they will need to extend their trunking facilities from Farrington Highway to serve the proposed Ho'opili project. It is possible that one or more micro-utility companies may be providing a portion or all telephone/communication services to the Petition Area and the rest of the Project Area. These telephone and communication lines (to be installed by Hawaiian Telcom, Oceanic Time Warner Cable and/or a micro-utility company), will require easements within and the use of State and County road right-of-ways. Electrical drawings of the project will be submitted to Hawaiian Telcom for its review and approval before the start of construction. There are no significant impacts to existing telephone or cable service that are anticipated, and as such, no mitigation measures are proposed for the expansion of existing service.

Due to the current location of the existing telephone pole line along Farrington Highway; Hawaiian Telcom, Oceanic Time Warner Cable, Pacific Lightnet will have to relocate their lines to either new poles or underground along Farrington Highway in the future. Similarly, another provider of telephone/communication lines to the proposed project may locate their lines to new poles along Farrington Highway. During the public review period for the EISPN, Hawaiian Telcom noted that with City and County of Honolulu's planned widening of Farrington Highway, "further review is required by Hawaiian Telcom during the design stages of the project to determine the scope of work and the associated relocation costs."

All new telephone and communication lines serving the Petition Area will be placed underground to reduce visual impacts.

AR00027171

4.9 PUBLIC SERVICES AND FACILITIES

The project will increase the population of 'Ewa. As such, the demand for public services (i.e., police and fire protection, public transportation) and public facilities (i.e., schools, hospitals, parks) will increase. The project will include as many as five public school sites and approximately 210 acres of public parks and open space.

4.9.1 Educational Facilities

Existing Conditions

The following table compiled from the State Department of Education (DOE) sources lists the past and projected enrollments of public schools within the vicinity of the Petition Area.

Table 4.1~~3~~4. Public School Enrollment

SCHOOL	2006-2007 CAPACITY	2002-2003 ENROLLMENT	2003-2004 ENROLLMENT	2004-2005 ENROLLMENT	2005-2006 ENROLLMENT	2006-2007 ENROLLMENT	2007-2008 ENROLLMENT	2012 PROJECTED ENROLLMENT	2012 ENROLLMENT LESS 2006-2007 CAPACITY

* The proposed schools have yet to be constructed.									

Source: State of Hawai'i, Department of Education, October 2007

The UHWO is proposing a 12-acre elementary school site and the DHHL is proposing an elementary school site and a middle school site within its East Kapolei Development Parcel 2 project area. A 50-acre high school on DHHL land between Farrington Highway and the H-1 Freeway is under discussion.

~~For planning purposes, the DOE assumes an enrollment of 550 students per elementary school, 600 students per middle school, and 1,000 students per high school. However, in 2007, the Hawaii State Legislature passed Act 245 regarding impact fees for schools. Act 245 defines "Recent School Construction Averages" as the department's historical average acres required and enrollment capacity for elementary (K-5), middle (6-8), and high (9-12). Based on existing school construction data, the historical average design standards are as follows:~~

~~Table 4.14. Existing School Construction Data~~

~~SCHOOL TYPE~~	~~ACRES/SCHOOL~~	~~ENROLLMENT/SCHOOL~~	~~ACRES/STUDENT~~
~~Elementary School~~	~~12.5~~	~~800 students~~	~~.0156 acre~~
~~Middle School~~	~~16.5~~	~~1,500 students~~	~~.0110 acre~~
~~High School~~	~~49.0~~	~~1,600 students~~	~~.0306 acre~~

During the Draft EIS public review period, the DOE commented that "Different schools are designed for different enrollment sizes, and once schools open, enrollments change over time. Campus sizes also vary. Historical averages do not determine school design standards." The Petitioner concurs and proposes to provide a total of 90 acres throughout out the project site that can be planned by DOE for public schools. The Petitioner is working with the DOE so that the larger land area campuses are sited away from mixed-use developments. Schools fitting within a single-block can be sited in higher density areas.

AR00027173

Anticipated Impacts and Mitigation Measures

The Petitioner has held frequent preliminary consultations with the DOE on the total number of public schools that need to be built within the project and their preliminary locations. While the number of schools has not been agreed upon, the project land use plan has been designed to include as many as five public school sites. The Conceptual Land Use Plan (See Figure 2.9: Conceptual Land Use Plan) shows possible locations for three elementary schools, one middle school, and one high school. In total, approximately 90 acres will be reserved for public schools and facilities to meet the demand for educational facilities in the growing 'Ewa region. The proposed schools in the Project Area will serve residents of Ho'opili and possibly some school-aged children from nearby future subdivisions in UHWO and DHHL East Kapolei Development Parcels 1 and 2. A high school will be attractive to certain~~ly attract residents~~ homebuyers from areas outside of Ho'opili. This does not include the possibility that one or two private schools may be included in Ho'opili. If a planned private school(s) is built within the project, this will increase educational choices for local families. UHWO will offer higher education opportunities for regional residents.

4.9.2 Police Protection

Existing Conditions

The proposed project is located within Honolulu Police Department (HPD) District 8, which encompasses the leeward coast and the 'Ewa Plain. There are approximately 100 field officers assigned to this district, and response time for the entire district fluctuates between five and seven minutes. In order to meet the growing needs of the 'Ewa Plain communities, in 2000, the City and County of Honolulu opened the Regional Kapolei Police Station at 1100 Kamokila Boulevard.

Anticipated Impacts and Mitigation Measures

The project will increase the population of Kapolei and the demand for police service. According to the *Ewa Development Plan*, the 'Ewa Villages Substation is planned to service the East 'Ewa region, which includes the Ho'opili project. The service date for this substation has yet to be determined. The Petitioner is proposing a public facility site immediately mauka of Farrington Highway near the western portion of Parcel B for a use such as a police substation, fire station and/or emergency medical service (EMS) site. During the public review period for the EISPN, the HPD wrote that "the project should have no unanticipated impact on the facilities or operations of the Honolulu Police Department." During the public review period for the Draft EIS, the HPD wrote that "the Honolulu Police Department (HPD) will need to expand its patrol services as Ho'opili is developed... the HPD looks forward to making the best use of the public facility site proposed by the developer as planning progresses."

AR00027174

4.9.3 Fire Protection

Existing Conditions

Fire protection in the *Ewa Development Plan Area* is provided by the Honolulu Fire Department (HFD) 'Ewa Beach Fire Station (an engine company), Makakilo Fire Station (an engine company), and Kapolei Fire Station (an engine and ladder company, and the Battalion 4 Headquarters). The Kapolei Fire Station located in Kapolei Business Park was completed in 1995 to serve the expanding development on the 'Ewa Plain.

Portions of the Petition Area consist of vacant scrub vegetation, which combined with the 'Ewa region's low annual rainfall, creates a potential fire hazard.

Anticipated Impacts and Mitigation Measures

The project will increase the population of 'Ewa and the demand for fire service. According to the *Ewa Development Plan*, to meet the projected population and economic growth in 'Ewa by 2020, three fire stations at 'Ewa Villages, Ko 'Olina, and Makaiwa Hills are planned, however service dates have yet to been determined. A new fire station is being planned on the DHHL East Kapolei Development Parcel 1 site near the intersection of Kapolei Parkway and North-South Road. The Petitioner is proposing a public facility site immediately mauka of Farrington Highway near the western portion of Parcel B for a use such as a fire station, EMS site and/or police substation. Within the Petition Area, access for fire apparatus, water supply, and building construction will be in conformance with existing codes and standards. As such, fire apparatus road shall be designed and constructed in accordance with the Uniform Fire Code, Section 902.2.1, as amended. Water infrastructure shall be designed and installed in accordance with the Uniform Fire Code, Section 903.2, as amended. In addition, civil drawings will be submitted to HFD for its review and approval.

4.9.4 Medical Facilities

Existing Conditions

Health care services in the 'Ewa region are provided by Hawai'i Medical Center West (the nearest hospital facility), Pali Momi Medical Center, Wahiawā General Hospital, Kaiser Permanente Waipi'o Clinic, and the recently opened Kapolei Medical Park (located across the Kapolei Shopping Center at the corner of Farrington Highway and Fort Barrette Road). Other routine medical services can be obtained at major hospital facilities in urban Honolulu, about a 30-minute drive from the subject property. The City and County of Honolulu has 18 emergency medical services Advanced Life Support Ambulance units and two Rapid Response Paramedic units on O'ahu. Two of the Advanced Life Support Ambulance units are located nearby, one at the Kapolei Fire Station, the other at the Waipahu Fire Station. One of the Rapid Response Paramedic units is located at the nearby Hawai'i Medical Center West.

AR00027175

Anticipated Impacts and Mitigation Measures

The project will increase the population of 'Ewa, and as such, there will be an occasional and unavoidable demand for emergency medical services. It is unlikely, however, that this demand will impact the level of service provided to other residents of O'ahu. The Petitioner is proposed a public facility site immediately mauka of Farrington Highway near the western portion of Parcel B for a use such as a police substation and/or EMS site. Existing medical and healthcare facilities in the 'Ewa region and surrounding areas should be able to accommodate the anticipated increase in demand.

4.9.5 Recreational Facilities

Existing Conditions

Recreational facilities in the 'Ewa area include regional parks, community parks, neighborhood parks, and beach/shoreline parks. Regional parks are large recreational complexes. According to the City and County of Honolulu Department of Parks and Recreation (DPR), community parks serve an approximate population of 10,000 people and normally include play fields, courts, and a recreation building. Neighborhood parks serve an approximate population of 5,000 people and usually include play fields, courts, and a comfort station. Beach/shoreline parks are day use parks primarily for swimming, sunbathing, and picnicking. Existing parks in the 'Ewa area are listed in the following table.

Table 4.15. 'Ewa Parks

NAME	TYPE	SIZE (ACRES)
Barbers Point Beach Park	Beach	7.39
'Ewa Beach Community Park	Community	13.25
'Ewa Beach Park	Beach	4.88
'Ewa Mahiko Neighborhood Park	Neighborhood	6.33
Kahe Point Beach Park	Beach	4.47
Kamokila Park	Community	5.89
Kapolei Community Park	Community	12.00
Kapolei Regional Park	Regional	69.39
Makakilo Community Park	Community	8.50
Makakilo Neighborhood Park	Neighborhood	4.01
Mauka Lani Neighborhood Park	Neighborhood	4.40
One'ula Beach Park	Beach	30.00
Pu'uloa Neighborhood Park	Neighborhood	4.34
West Beach Shoreline Park, North	Beach	10.00
West Beach Shoreline Park, South	Beach	18.26
Source: *State Comprehensive Outdoor Recreation Plan*, State of Hawai'i, Department of Land and Natural Resources, May 2003		

AR00027176

Anticipated Impacts and Mitigation Measures

The project includes approximately 210 acres for park and open space. The Petitioner proposes a series of parks and open spaces including a district park with active playfields, proposed to be located within the center of the Ho'opili project. In addition, a Canyon Park, located at the southeastern portion of the Ho'opili project, will provide a unique wilderness-type park alternative for residents. A Civic Plaza is envisioned as a community gathering space for outdoor concerts, farmer's markets, and other community events. Interspersed throughout the project will be "mini" (neighborhood) parks

Open space buffers are proposed to be located along the H-1 Freeway and Old Fort Weaver Road. In addition, linear parks and open space will encircle the Ho'opili project with walking/biking paths. "Mini" parks located throughout the project will be within walking distance of most residences. A regional bikeway plan has been developed in cooperation with UHWO, DHHL and HCDA. Figure 4.6~~3~~: East Kapolei Regional Bikeway Plan shows the approximate alignment of bikeways being proposed by DHHL, UHWO and the Petitioner and how they may connect to bikeways proposed by others (such as HCDA), the bike path shown on the Ewa DP Public Facilities Map, the bikeways shown on the State Bicycle Plan 2003, and park sites proposed by HCDA, DHHL, UHWO and the Petitioner, and possible transit stops (locations being finalized as of this writing). Based on comments received from the City and County of Honolulu Department of Facilities Management during the public review period, project bikeways and walkways not located within road rights-of-ways dedicated to the government will be privately-owned and maintained.

The City and County of Honolulu's Park Dedication Ordinance applies to all new residential developments and will mitigate the demand for recreational facilities. In addition, the project may include organizations that provide recreational and/or social service facilities such as the Boys and Girls Clubs and YMCAs.

The City and County of Honolulu Department of Parks and Recreation (DPR) reviewed the EISPN and Draft EIS, and wrote that it had no comments to offer at this time. As recommended in the City and County of Honolulu Department of Design and Construction (DDC), the Petitioner will meet with City officials from the Department of Planning and Permitting, DDC, and DPR at an early stage in the development's planning process to develop a conceptual plan for overall park development which is acceptable and appropriate.

4.9.6 Public Transit

Existing Conditions

Oahu Transit Services, Inc. under contract to the City and County of Honolulu provides TheBus fixed-route service to the communities adjacent to and in the general vicinity of

AR00027177

the proposed Ho'opili project. These routes include both suburban trunk routes and express routes. TheBus operates seven bus lines that directly serve the proposed Project and its immediate vicinity, they include:

- **Route A City Express.** Route A operates express service that connects Waipahu and Pearlridge with Downtown and the University of Hawai'i at Mānoa. Service is provided at approximately 15 minute intervals between 4:45 AM and 10:00 PM on weekdays, and 30 minute intervals between 5:00 AM and 8:30 PM on weekends.

- **Route 41 Kapolei Transit Center.** This route serves the Villages of Kapolei areas, including a portion of the Makakilo Drive-Fort Barrette Road. Service is provided approximately at one hour intervals from about 5:00 AM to 9:00 PM, seven days a week.

- **Route 42 'Ewa Beach.** Route 42 provides service along Farrington Highway in the City of Kapolei at half-hour intervals from approximately 6:00 AM to 1:30 AM for westbound travel seven days a week. Eastbound service runs from approximately 4:00 AM to 1:00 AM also seven days a week.

- **Route 43 Waipahu Transit Center.** This route provides service along the H-1 Freeway and through the City of Waipahu, connecting Waipahu to downtown Honolulu. Service is provided seven days a week at half-hour intervals from 7:00 AM to 5:00 PM.

- **Route 81 Waipahu Express (PM)/ Downtown Express (AM).** This route provides express service at approximately 15 minute intervals from Waipahu to Downtown during the morning hours between 4:30 AM and 7:30 AM. Evening service frequency to Waipahu varies from 15 to 30 minute intervals and operates between 3:00 PM and 6:20 PM.

- **Route 91 Downtown Express (AM) / 'Ewa Beach Express (PM).** Service is provided along the H-1 Freeway connecting the Downtown to 'Ewa Beach. Eastbound service on this route runs at 20 minute intervals from 4:30 AM to 7:00 AM, connecting 'Ewa Beach to the Downtown. Westbound service to 'Ewa Beach is provided during the PM hours at 20 minute intervals beginning at 3:25 PM and concluding at 6:15 PM.

- **Route 102 Villages of Kapolei Express.** This route provides three morning Honolulu-bound trips and three afternoon return trips to the Villages of Kapolei during the peak commute periods. The route provides service along Fort Barrette Road and Farrington Highway in the Villages of Kapolei area.

In addition to TheBus express routes, the Leeward Oahu Transportation Management Association (LOTMA) also sponsors an express bus service along Fort Weaver Road to Honolulu with one morning and one afternoon trip.

Future Conditions

The City and County of Honolulu is planning for a high-capacity transit corridor project between Kapolei and the University of Hawai'i at Mānoa. The Honolulu High-Capacity Transit Corridor Project (HHCTCP) has evaluated transit alternatives for the 23-mile long corridor between Kapolei and UH Mānoa. On December 22, 2006, the City Council adopted Bill 79 (2006), CD2, FD2 (Ordinance 07-001) which selected the fixed guideway alternative as the Locally Preferred Alternative (LPA). The LPA route travels between Kapolei and the University of Hawai'i at Mānoa, starting at or near the intersection of Kapolei Parkway and Kalaeloa Boulevard, down Saratoga Avenue to North-South Road (green route) or along Kamokila Boulevard (yellow route), as determined by the City and County of Honolulu administration before or during preliminary engineering. The route then continues to Farrington Highway across Ft. Weaver Road, to Kamehameha Highway to Salt Lake Boulevard and Aolele Street, as determined by the City administration before or during preliminary engineering to downtown Honolulu via Dillingham Boulevard. After leaving Dillingham Boulevard, the alignment would continue along Nimitz Highway, Halekauwila Street and Kapi'olani Boulevard to UH Mānoa with a branch to Waikīkī (See Figure 4.7~~4~~: Planned High-Capacity Transit Corridor & Proposed Transit Station). The City and County of Honolulu will now undertake preliminary engineering and is in the process of preparing the environmental impact statement for the LPA. As the first project, the City Council selected a minimum operable segment (MOS) that will begin near the Kroc Center on North-South Road to Farrington Highway, through Waipahu, Pearl City, Aiea, and via Salt Lake Boulevard through downtown Honolulu to Ala Moana Center. As of this writing, we understand that the portion of the alignment between the Kroc Center and Waipahu, the location of the transit maintenance and storage facility, and the location of potential transit stations are being finalized.

Both of the possible Kapolei alignments include at least one station within the Ho'opili site. If required for the transit project, the Petitioner will coordinate with DTS regarding the possibility of allocating a portion of the project lands for a potential high-capacity transit maintenance and storage facility.

The Fixed Guideway Alternative alignments that are adjacent to the Ho'opili site would either be at-grade with limited grade crossings or on elevated structures. The fixed guideway could be as narrow as 25 feet wide. If the structures are elevated, they would be supported by six foot wide columns and the structure could be about 30 feet tall.

At this time, no decision has been made regarding the technology that would be used for the Fixed Guideway Alternative. This decision will be made at a later stage of project development. The City and County of Honolulu is preparing a Draft EIS and is in the

AR00027180

process of requesting approval from the Federal Transit Administration to begin preliminary engineering (project design). Now that the City Council has selected the Fixed Guideway Alternative, the area landowners, including DHHL, UHWO and the Petitioner have been coordinating with the Department of Transportation Services in finalizing the high-capacity transit corridor alignment and location of transit stations between the Kroc Center and Waipahu. The earliest that construction could begin on a selected alternative would be 2009. Due to the size and cost of the overall project, it is likely to be built in several phases lasting several years, starting with the first project, or MOS.

Anticipated Impacts and Mitigation Measures

Ho'opili will be designed to be walkable/bikable and transit-ready. The use of public transportation will be encouraged within the Petition Area, as TheBus passes through it along Farrington Highway and transit nodes and corridors are located nearby. With several public schools and retail areas proposed, the Ho'opili Conceptual Land Use Plan is planned as a community in which residents can live, work, play, shop, and attend school. Additionally, the UHWO campus will enable 'Ewa residents to attend an institution of higher learning without commuting to Honolulu. Increased use of public transportation means fewer residents driving their own vehicles and less traffic on roadways. As the Ho'opili Project and the City of Kapolei develop over several years, east-west vehicular traffic to and from Honolulu is likely to gradually adjust as more jobs are created in Kapolei and Kalaeloa. The Petitioner will continue to coordinate with the Department of Transportation Services (DTS) in regards to the Honolulu High-Capacity Transit Corridor Project.

4.9.7 Community Services

Existing Conditions

Community services in the vicinity of the proposed Ho'opili project are listed below:

- Schools (See Section 4.9.1)
- Kapolei Police Station (See Section 4.9.2)
- Three Fire Stations in the 'Ewa Region (See Section 4.9.3)
- Churches
- Shopping Centers in Kapolei and Makakilo
- Public Libraries in Kapolei and Makakilo
- Post Offices in Kapolei and 'Ewa
- Medical Facilities (See Section 4.9.4)
- Recreational Facilities (See Section 4.9.5)
- Public Transit Facilities (See Section 4.9.6)

AR00027181

Anticipated Impacts and Mitigation Measures

The proposed Ho'opili project is not expected to adversely impact the community services in the region. The project's anticipated impacts and mitigation measures on public educational facilities, HPD and HFD facilities, medical facilities, recreational facilities, and public transit facilities were previously mentioned in this section.

AR00027183

(This page intentionally left blank.)

AR00027184

5.0
Relationship to Land Use Plans, Policies, & Controls

5.0 RELATIONSHIP TO LAND USE PLANS, POLICIES, AND CONTROLS

This section discusses the relationship of the proposed project to Federal, State, and County land use plans, policies, and controls for the 'Ewa region. Some of the land use plans, policies and guidelines are in tabular form, and are addressed with text and/or the following letter code:

S = Supportive, N/S = Not Supportive, N/A = Not Applicable.

5.1 FEDERAL

Americans with Disabilities Act. The Americans with Disabilities Act (ADA) of 1990 establishes guidelines for accessibility to buildings and facilities by individuals with disabilities. To the extent required by regulations issued by federal agencies, ADA guidelines will be applied to the Petition Area during the design and construction phases. In addition, the design of public spaces will be integrated to promote greater accessibility for persons with disabilities. It should be noted that most of the Petition Area consists of naturally moderate slopes, thus providing the potential for good accessibility.

National Pollution Discharge Elimination System. A National Pollution Discharge Elimination System (NPDES) permit, administered by the State DOH, will be required for this project. As such, an NPDES permit application will be submitted prior to Grading Permits.

5.2 STATE OF HAWAI'I

5.2.1 Environmental Impact Statement Law, Chapter 343, Hawaii Revised Statutes

This EIS has been prepared in compliance with Chapter 343, *Hawaii Revised Statutes* (HRS). Various agencies, organizations, and individuals were consulted during the pre-consultation phase for the EIS. EISPN comment letters and applicable responses are included in Section 12.0. A 45-day review period will commence upon publication of the Draft EIS in the Office of Environmental Quality Control (OEQC) *The Environmental Notice*. Comment letters on the Draft EIS and applicable responses will be provided in the Final EIS.

5.2.2 State Environmental Policy, Chapter 344, Hawaii Revised Statutes

State Environmental Policy, Chapter 344, HRS establishes a State policy to encourage productive and enjoyable harmony between people and their environment, promote efforts which will prevent or eliminate damage to the environment and biosphere and stimulate the health and welfare of humanity, and enrich the understanding of the

AR00027186

ecological systems and natural resources important to the people of Hawai'i. A discussion of the policy guidelines are listed in the table below.

Table 5.1. State Environmental Policy, Chapter 344, Hawaii Revised Statutes

State Environmental Policy, Chapter 344, Hawaii Revised Statutes	S	N/S	N/A
§344-4 Guidelines. In pursuance of the state policy to conserve the natural resources and enhance the quality of life, all agencies, in the development of programs, shall, insofar as practicable, consider the following guidelines:			
(1) POPULATION.			
(A) Recognize population impact as a major factor in environmental degradation and adopt guidelines to alleviate this impact and minimize future degradation;	X		
(B) Recognize optimum population levels for counties and districts within the State, keeping in mind that these will change with technology and circumstance, and adopt guidelines to limit population to the levels determined.	X		
Discussion: The Ho'opili project will provide up to 11,750 residential units. According to the economic/fiscal impact report, Ho'opili project would increase the overall regional population by approximately 35,290 residents. The population increase is consistent with the City and County of Honolulu's policy to direct future growth to the 'Ewa region.			
(2) LAND, WATER, MINERAL, AIR, AND OTHER NATURAL RESOURCES.			
(A) Encourage management practices which conserve and fully utilize all natural resources;	X		
(B) Promote irrigation and waste water management practices which conserve and fully utilize vital water resources;	X		
(C) Promote the recycling of waste water;	X		
(D) Encourage management practices which conserve and protect watersheds and water sources, forest, and open space areas;			X
(E) Establish and maintain natural area preserves, wildlife preserves, forest reserves, marine preserves, and unique ecological preserves;			X
(F) Maintain an integrated system of state land use planning which coordinates the state and county general plans.			X
(G) Promote the optimal use of solid wastes through programs of waste prevention, energy resource recovery, and recycling so that all our wastes become utilized.	X		
Discussion: Sustainability options are being considered for the Ho'opili project.			
(3) FLORA AND FAUNA.			
(A) Protect endangered species of indigenous plants and animals and introduce new plants or animals only upon assurance of negligible ecological hazard;	X		
(B) Foster the planting of native as well as other trees, shrubs, and flowering plants compatible to the enhancement of our environment.	X		
Discussion: None of the plant species identified in the Project Area are considered a threatened or endangered species or a species of concern. A concerted effort was made in surveying for Ko'oloa'ula; however, no plants were observed on the property. As such, the Ho'opili project is not expected to have a significant impact on the botanical resources in the 'Ewa region. No endangered			

AR00027187

State Environmental Policy, Chapter 344, Hawaii Revised Statutes	S	N/S	N/A
animal species were encountered during fauna surveys of the Project Area.			
(4) PARKS, RECREATION, AND OPEN SPACE.			
(A) Establish, preserve and maintain scenic, historic, cultural, park and recreation areas, including the shorelines, for public recreational, educational, and scientific uses;	X		
(B) Protect the shorelines of the State from encroachment of artificial improvements, structures, and activities;			X
(C) Promote open space in view of its natural beauty not only as a natural resource but as an ennobling, living environment for its people.	X		
Discussion: The Ho'opili project includes approximately 210 acres of parks and open space within the Petition Area. A hierarchy of open spaces will be provided throughout the Petition Area, which includes a downtown civic plaza. A district park is being planned along Old Fort Weaver Road. In addition, a significant open space and pedestrian/bicycle trail network will provide a wide variety of recreational opportunities for residents and visitors alike. A variety of open space buffers are planned along H-1 Freeway, Honouliuli Gulch, and Old Fort Weaver Road to promote the connectivity of the Ho'opili project to adjacent neighborhoods. Project landscaping, the provision of view corridors, and sensitive architectural design will set the visual character of the area.			
(5) ECONOMIC DEVELOPMENT.			
(A) Encourage industries in Hawaii which would be in harmony with our environment;			X
(B) Promote and foster the agricultural industry of the State; and preserve and conserve productive agricultural lands;			X
(C) Encourage federal activities in Hawaii to protect the environment;			X
(D) Encourage all industries including the fishing, aquaculture, oceanography, recreation, and forest products industries to protect the environment;			X
(E) Establish visitor destination areas with planning controls which shall include but not be limited to the number of rooms;			X
(F) Promote and foster the aquaculture industry of the State; and preserve and conserve productive aquacultural lands.			X
Discussion: Within the Petition Area, lands will be gradually withdrawn from agricultural production for the proposed Ho'opili project. This will result in some loss in revenues, jobs, or payroll. However, the State and Count have long planned for new development in the Petition Area, and tenants have been fully aware, for quite some time, that the proposed Petition Area would be used to accommodate for future urban development in the region.			
(6) TRANSPORTATION.			
(A) Encourage transportation systems in harmony with the lifestyle of the people and environment of the State;	X		
(B) Adopt guidelines to alleviate environmental degradation caused by motor vehicles;	X		
(C) Encourage public and private vehicles and transportation systems to conserve energy, reduce pollution emission, including noise, and provide safe and convenient accommodations for their users.	X		
Discussion: The proposed Ho'opili project is envisioned as a "complete" community where residents can live, work, learn, play, and shop within the 'Ewa region, thus alleviating traffic to other destinations in Honolulu. Since much of the morning commute from 'Ewa is towards downtown Honolulu and the University of Hawai'i at Mānoa, as Kapolei (including the proposed Ho'opili			

AR00027188

State Environmental Policy, Chapter 344, Hawaii Revised Statutes	S	N/S	N/A
project) generates more employment and career opportunities, and University of Hawai'i at West O'ahu develops, the morning commute on the H-1 Freeway should lessen. Ho'opili is conveniently located near major transportation facilities, and is designed to be bus/high-capacity transit-ready with a vast, interconnected internal street grid that provides numerous ways of getting around by rail transit, bus, walking, bicycle and car. The Ho'opili project will reduce commuting time and distances for residents in the 'Ewa region. The Ho'opili mixed-use community contains a series of neighborhoods with a myriad of uses including residential, retail, office, and light industrial which would reduce the necessity to travel outside of the region. Within the petition area, pedestrian walkways and bicycle lanes will encourage non-motorized forms of transportation and reduce fossil fuel consumption.			
(7) ENERGY.			
(A) Encourage the efficient use of energy resources.	X		
Discussion: Project buildings, activities, and site grounds are planned to be designed with energy-saving considerations, and the project will be consistent with State's objective to promote cost-effective energy conservation through the adoption of energy-efficient practices and technologies. Given the natural climate, the project may be suited for the use of renewable energy technologies including photovoltaics. In addition, based on the Department of Business, Economic Development & Tourism (DBEDT), Strategic Industries Division's recommendations, Ho'opili's mechanical and electrical consultants, in consultation with its sustainability consultant, will be directed to review the City and County of Honolulu's Energy Code early in the project and to consult with Hawaiian Electric Company, Inc. (HECO) on demand-side management programs that offer rebates for installation of energy-efficient technologies.			
(8) COMMUNITY LIFE AND HOUSING.			
(A) Foster lifestyles compatible with the environment; preserve the variety of lifestyles traditional to Hawaii through the design and maintenance of neighborhoods which reflect the culture and mores of the community;	X		
(B) Develop communities which provide a sense of identity and social satisfaction in harmony with the environment and provide internal opportunities for shopping, employment, education, and recreation;	X		
(C) Encourage the reduction of environmental pollution which may degrade a community;	X		
(D) Foster safe, sanitary, and decent homes;	X		
(E) Recognize community appearances as major economic and aesthetic assets of the counties and the State; encourage green belts, plantings, and landscape plans and designs in urban areas; and preserve and promote mountain-to-ocean vistas.	X		
Discussion: The proposed Ho'opili project is envisioned as a "complete" community, where residents can live, work, learn, play, and shop. The project would include a mixed-use community that would complete and connect 'Ewa with the surrounding communities. Originating from the common vision and values of a community-driven planning effort, the conceptual plan contains a series of neighborhoods with a mix of uses including residential, retail, office and light industrial. Included in this mix are a series of parks, schools, public buildings and community centers which act as a focus and help define the identity of each neighborhood. Ho'opili will be connected to the surrounding 'Ewa District by a network of streets and bicycle paths which allow a variety of circulation options for residents and visitors. In the geographical center of the site there is a public square or Civic Plaza that is surrounded by higher density housing			

AR00027189

State Environmental Policy, Chapter 344, Hawaii Revised Statutes	S	N/S	N/A
development and mixed-use buildings. Housing intensity transitions to lower density small lot single-family homes along the eastern and southern peripheries of the site. A significant open space and pedestrian/bicycle trail network provides a wide variety of recreational opportunities for residents and other members of the 'Ewa community. Ho'opili will incorporate traditional Hawaiian building styles with a modern, contemporary aesthetic and will reflect the landscape and climate. Sustainability options are being considered for the Ho'opili project.			
§(9) EDUCATION AND CULTURE.			
(A) Foster culture and the arts and promote their linkage to the enhancement of the environment;	**X**		
(B) Encourage both formal and informal environmental education to all age groups.			**X**
Discussion: While the residential population within Kapolei has grown as planned, it lacks much of the culture and the arts which are available within the Primary Urban Center. The Ho'opili project is planned to include a series of parks, schools, public buildings and community centers which act as a focus and help define the identity of each neighborhood.			
(10) CITIZEN PARTICIPATION.			
(A) Encourage all individuals in the State to adopt a moral ethic to respect the natural environment; to reduce waste and excessive consumption; and to fulfill the responsibility as trustees of the environment for the present and succeeding generations; and	**X**		
(B) Provide for expanding citizen participation in the decision making process so it continually embraces more citizens and more issues.			**X**
Discussion: Recycling shall be encouraged within the project including the reuse and recycling of green waste generated during construction clearing and grubbing activities, the use of recycled construction and demolition wastes and the use of materials made from recycled products, the use of locally produced compost as available for landscaping, and the provision of space for recycling bins in the detailed design of the community. The City and County of Honolulu is restarting its curbside pick up recycling program. In November, 2007, two pilot curbside recycling programs began in Mililani and Hawai'i Kai. During the six- to twelve-month evaluation period, the City and County of Honolulu Department of Environmental Services staff will be coordinating plans for island-wide expansion. On June 27, 2008, the Associated Press reported that Mililani and Hawai'i Kai residents have recycled 54 percent of their cans, bottles, newspapers and green waste during the city's six-month curbside recycling pilot project. City Officials with the City and County of Honolulu Department of Environmental Services (DES) are reportedly satisfied with the results and are moving forward with plans to provide some 160,000 O'ahu homes the curbside recycling service by May 2010. In the new plan, the city will collect garbage and recyclables each once a week. The DES will no longer have garbage pickup twice-weekly. A study released by DES predicts the program will divert an estimated 53,800 tons of mixed recyclables and green waste from O'ahu landfills. They plan to begin expanding the program to more communities in November 2008.			

AR00027190

5.2.3 State Land Use Law, Chapter 205, Hawaii Revised Statutes

The *State Land Use Law* (Chapter 205, HRS) establishes the State Land Use Commission (LUC) and designates all lands in the State of Hawai'i into four districts: Urban, Rural, Agricultural, and Conservation.

The Petition Area is within the State Agricultural District (See Figure 2.4: State Land Use District). As such, a State Land Use District Boundary Amendment will be sought to change the site from the Agricultural District to the Urban District.

The LUC's decision making criteria for petitions for reclassification of district boundaries can be found in Section 205-17, HRS, and Section 15-15-77, HAR. Additionally, Section 15-15-18, HAR contains standards used in determining the Urban district. The following table is an analysis of how the project conforms to these criteria and standards.

Table 5.2. State Land Use Law Chapter 205, Hawaii Revised Statutes, Section 15-15-77, Hawaii Administrative Rules

State Land Use Law Chapter 205, Hawaii Revised Statutes, Section 15-15-77, Hawaii Administrative Rules	S	N/S	N/A
LAND USE COMMISSION DECISION MAKING CRITERIA			
HRS §205-17 Land use commission decision making criteria. In its review of any petition for reclassification of district boundaries pursuant to this chapter, the commission shall specifically consider the following:			
(1) The extent to which the proposed reclassification conforms to the applicable goals, objectives, and policies of the Hawaii state plan and relates to the applicable priority guidelines of the Hawaii state plan and the adopted functional plans;	X		
(2) The extent to which the proposed reclassification conforms to the applicable district standards;	X		
(3) The impact of the proposed reclassification on the following areas of state concern:	X		
(A) Preservation or maintenance of important natural systems or habitats;	X		
(B) Maintenance of valued cultural, historical, or natural resources;	X		
(C) Maintenance of other natural resources relevant to Hawaii's economy, including, but not limited to, agricultural resources;	X		
(D) Commitment of state funds and resources;	X		
(E) Provision of employment opportunities and economic development; and	X		
(F) Provision for housing opportunities for all income groups, particularly the low, low-moderate, and gap groups; and	X		
(4) The representations and commitments made by the petitioner in securing a boundary change.	X		
Discussion: In accordance with Commission Rule § 15-15-77, HAR, and HRS § 205-4(h), and based upon information included in this EIS the district boundary amendment requested by the Petitioner is reasonable, not violative of HRS § 205-2, as amended, and is consistent with the provisions of HRS §§			

AR00027191

State Land Use Law Chapter 205, Hawaii Revised Statutes, Section 15-15-77, Hawaii Administrative Rules	S	N/S	N/A
205-16, 205-17 and 205A-2 and Chapter 226, as amended. The Petitioner will seek an Order Amending the Land Use District Boundary of the Petition Area from the Agricultural District to the Urban District.			
HAR §15-15-77 Decision-making criteria for boundary amendments.			
(a) The commission shall not approve an amendment of a land use district boundary unless the commission finds upon the clear preponderance of the evidence that the proposed boundary amendment is reasonable, not violative of section 205-2, HRS, and consistent with the policies and criteria established pursuant to sections 205-16, 205-17, and 205A-2, HRS.	X		
(b) In its review of any petition for reclassification of district boundaries pursuant to this chapter, the commission shall specifically consider the following:	X		
(1) The extent to which the proposed reclassification conforms to the applicable goals, objectives, and policies of the Hawaii state plan and relates to the applicable priority guidelines of the Hawaii state plan and the adopted functional plans;	X		
(2) The extent to which the proposed reclassification conforms to the applicable district standards;	X		
(3) The impact of the proposed reclassification on the following areas of state concern;	X		
(A) Preservation or maintenance of important natural systems or habitats;	X		
(B) Maintenance of valued cultural, historical, or natural resources;	X		
(C) Maintenance or other natural resources relevant to Hawaii's economy including, but not limited to agricultural resources;	X		
(D) Commitment of state funds and resources;	X		
(E) Provision for employment opportunities and economic development; and	X		
(F) Provision for housing opportunities for all income groups, particularly the low, low-moderate, and gap groups;	X		
(4) In establishing the boundaries of the districts in each county, the commission shall give consideration to the general plan of the county in which the land is located;	X		
(5) The representations and commitments made by the petitioner in securing a boundary change, including a finding that the petitioner has the necessary economic ability to carry out the representations and commitments relating to the proposed use or development; and	X		
(6) Lands in intensive agricultural use for two years prior to date of filing of a petition or lands with a high capacity for intensive agricultural use shall not be taken out of the agricultural district unless the commission finds either that the action:	X		
(A) Will not substantially impair actual or potential agricultural production in the vicinity of the subject property or in the county or State; or			X
(B) Is reasonably necessary for urban growth.	X		
(c) Amendments of a land use district boundary in conservation districts involving land areas fifteen acres or less shall be determined by the commission pursuant to this subsection and section 205-3.1, HRS.			X
(d) Amendments of land use district boundary in other than conservation districts involving land areas fifteen acres or less shall be determined by the			X

State Land Use Law Chapter 205, Hawaii Revised Statutes, Section 15-15-77, Hawaii Administrative Rules	S	N/S	N/A
appropriate county land use decision-making authority for the district.			
(e) Amendments of a land use district boundary involving land areas greater than fifteen acres shall be determined by the commission, pursuant to this subsection and section 205-3.1, HRS.	X		
Discussion: The proposed action is consistent with the standards for determining boundaries of the Urban district pursuant to HAR § 15-15-18. Reclassification of the Petition Area to the Urban District and the subsequent City and County of Honolulu Change of Zone Application would permit the Petition Area to conform to the surrounding land uses and would permit the low-to medium-density residential uses and recreational development.			
STANDARDS FOR DETERMINING URBAN DISTRICT BOUNDARIES			
HAR §15-15-18 Standards for determining "U" urban district boundaries. Except as otherwise provided in this chapter, in determining the boundaries for the "U" urban district, the following standards shall be used:			
(1) It shall include lands characterized by "city-like" concentrations of people, structures, streets, urban level of services and other related land uses;	X		
(2) It shall take into consideration the following specific factors:	X		
(A) Proximity to centers of trading and employment except where the development would generate new centers of trading and employment;	X		
(B) Availability of basic services such as schools, parks, wastewater systems, solid waste disposal, drainage, water, transportation systems, public utilities, and police protection; and	X		
(C) Sufficient reserve areas for foreseeable urban growth;	X		
(3) It shall include lands with satisfactory topography, drainage, and reasonably free from the danger of any flood, tsunami, unstable soil condition, and other adverse environmental effects;	X		
(4) Land contiguous with existing urban areas shall be given more consideration than non-contiguous land, and particularly when indicated for future urban use on state or county general plans;	X		
(5) It shall include lands in appropriate locations for new urban concentrations and shall give consideration to areas of urban growth as shown on the state and county general plans;	X		
(6) It may include lands which do not conform to the standards in paragraphs (1) to (5):	X		
(A) When surrounded by or adjacent to existing urban development; and	X		
(B) Only when those lands represent a minor portion of this district;			X
(7) It shall not include lands, the urbanization of which will contribute toward scattered spot urban development, necessitating unreasonable investment in public infrastructure or support services; and	X		
(8) It may include lands with a general slope of twenty per cent or more if the commission finds that those lands are desirable and suitable for urban purposes and that the design and construction controls, as adopted by any federal, state, or county agency, are adequate to protect the public health, welfare and safety, and the public's interests in the aesthetic quality of the landscape.			X
Discussion: The Ho'opili project is consistent with the standards for determining boundaries of the Urban District pursuant to Section 15-15-18, HAR, and as such, a State Land Use District Boundary Amendment will be sought to change the site from the Agricultural District to the Urban District. The			

AR00027193

State Land Use Law Chapter 205, Hawaii Revised Statutes, Section 15-15-77, Hawaii Administrative Rules	S	N/S	N/A
majority of adjacent lands that surround the Petition Area are within the Urban District. Existing residential developments include: Waipahu Town to the northeast; Honouliuli and West Loch Estates to the east; and 'Ewa Villages and 'Ewa Villages Golf Course to the south. Vacant lands to the west are slated for future development by UHWO and DHHL. The lands to the north of the Petition Area are within the Agricultural State Land Use District, and are mauka of the City and County of Honolulu's Ewa DP Urban Growth Boundary. The Petition Area lies within the City and County of Honolulu's Ewa DP Urban Growth Boundary, and as such, reclassification of the Petition Area to the Urban District and subsequent City and County of Honolulu Change of Zone application would permit the Petition Area to conform to the surrounding land uses and would permit the low-to medium-density residential uses and recreational development. Urbanization of 'Ewa is further assumed by the City and County of Honolulu through the planning of HHCTC alignment through the Petition Area.			

AR00027194

5.2.4 Coastal Zone Management Program, Chapter 205A, Hawaii Revised Statutes

All lands of the State of Hawai'i are included within the Coastal Zone Management (CZM) Area as defined in Chapter 205A, HRS. As such, the Petition Area is within the CZM Area; however, it is not located along a shoreline.

The objectives and policies of the CZM Program are discussed in the table below.

Table 5.3. Coastal Zone Management Act, Chapter 205A, Hawaii Revised Statutes

Coastal Zone Management Act, Chapter 205A, Hawaii Revised Statutes	S	N/S	N/A
RECREATIONAL RESOURCES			
Objective			
(A) Provide coastal recreational opportunities accessible to the public.			
Policies			
(A) Improve coordination and funding of coastal recreational planning and management; and			X
(B) Provide adequate, accessible, and diverse recreational opportunities in the coastal zone management area by:			X
(i) Protecting coastal resources uniquely suited for recreational activities that cannot be provided in other areas;			X
(ii) Requiring replacement of coastal resources having significant recreational value including, but not limited to, surfing sites, fishponds, and sand beaches, when such resources will be unavoidably damaged by development; or requiring reasonable monetary compensation to the State for recreation when replacement is not feasible or desirable;			X
(iii) Providing and managing adequate public access, consistent with conservation of natural resources, to and along shorelines with recreational value;			X
(iv) Providing an adequate supply of shoreline parks and other recreational facilities suitable for public recreation;			X
(v) Ensuring public recreational uses of county, state, and federally owned or controlled shoreline lands and waters having recreational value consistent with public safety standards and conservation of natural resources;			X
(vi) Adopting water quality standards and regulating point and nonpoint sources of pollution to protect, and where feasible, restore the recreational value of coastal waters;			X
(vii) Developing new shoreline recreational opportunities, where appropriate, such as artificial lagoons, artificial beaches, and artificial reefs for surfing and fishing; and			X
(viii) Encouraging reasonable dedication of shoreline areas with recreational value for public use as part of discretionary approvals or permits by the land use commission, board of land and natural resources, and county authorities; and crediting such dedication against the requirements of section 46-6.			X
Discussion: The majority of the Ho'opili project is located in Zone D, areas in which flood hazards			

AR00027195

Coastal Zone Management Act, Chapter 205A, Hawaii Revised Statutes	S	N/S	N/A
are undetermined (See Figure 3.5: Flood Insurance Rate Map). A very small portion of Parcel C within Honouliuli Stream is located in Zone AE and X. A portion of Parcel B within Honouliuli Stream is located in Zone A and Zone X. However, with the proposed development and associated drainage improvements, surface flows will be better managed. With respect to the portion of the project within the Kalo'i drainage basin, the project will be creating on-site detention basins to collect all storm water runoff and discharge the flow at a rate that will not exceed pre-development conditions. With respect to the Honouliuli Stream drainage basin, the project will provide detention basins to collect all storm water runoff and discharge the flow at a rate that will not exceed the 10-year recurrence flow rate. With respect to the West Loch drainage basin, the project intends to collect all storm water and route it to the existing detention basin located on the east side of Fort Weaver Road and south of the OR&L railroad tracks. Off-site drainage improvements will comply with all applicable governmental rules and regulations. Since the property is located inland, the project is not anticipated to impact access to coastal resources.			
HISTORIC RESOURCES			
Objective			
(A) Protect, preserve, and, where desirable, restore those natural and manmade historic and prehistoric resources in the coastal zone management area that are significant in Hawaiian and American history and culture.			
Policies			
(A) Identify and analyze significant archaeological resources;	**X**		
(B) Maximize information retention through preservation of remains and artifacts or salvage operations; and	**X**		
(C) Support state goals for protection, restoration, interpretation, and display of historic resources.	**X**		
Discussion: According to SHPD, the archaeological inventory survey report is now accepted in fulfillment of Sections 13-284 and 13-276, HAR (See Appendix E). A preservation plan and archaeological monitoring plan will be prepared and submitted to SHPD for its review and approval.			
SCENIC AND OPEN SPACE RESOURCES			
Objective			
(A) Protect, preserve, and, where desirable, restore or improve the quality of coastal scenic and open space resources.			
Policies			
(A) Identify valued scenic resources in the coastal zone management area;			**X**
(B) Ensure that new developments are compatible with their visual environment by designing and locating such developments to minimize the alteration of natural landforms and existing public views to and along the shoreline;			**X**
(C) Preserve, maintain, and, where desirable, improve and restore shoreline open space and scenic resources; and			**X**
(D) Encourage those developments that are not coastal dependent to locate in inland areas.			**X**
Discussion: The Ho'opili project is located outside of the Special Management Area. As such, coastal scenic resources will not be significantly affected by the development. Open space buffers are proposed to be located along the H-1 Freeway and Old Fort Weaver Road. In addition, linear parks and open space will encircle the Ho'opili project with walking/biking paths.			
COASTAL ECOSYSTEMS			
Objective			

AR00027196

Coastal Zone Management Act, Chapter 205A, Hawaii Revised Statutes	S	N/S	N/A
(A) Protect valuable coastal ecosystems, including reefs, from disruption and minimize adverse impacts on all coastal ecosystems.			
Policies			
(A) Exercise an overall conservation ethic, and practice stewardship in the protection, use, and development of marine and coastal resources;			X
(B) Improve the technical basis for natural resource management;			X
(C) Preserve valuable coastal ecosystems, including reefs, of significant biological or economic importance;			X
(D) Minimize disruption or degradation of coastal water ecosystems by effective regulation of stream diversions, channelization, and similar land and water uses, recognizing competing water needs; and			X
(E) Promote water quantity and quality planning and management practices that reflect the tolerance of fresh water and marine ecosystems and maintain and enhance water quality through the development and implementation of point and nonpoint source water pollution control measures.			X
Discussion: The Ho'opili project does not front the natural shoreline. With respect to the portion of the project within the Kalo'i drainage basin, the project will be creating on-site detention basins to collect all storm water runoff and discharge the flow at a rate that will not exceed pre-development conditions. With respect to the Honouliuli Stream drainage basin, the project will provide detention basins to collect all storm water runoff and discharge the flow at a rate that will not exceed the 10-year recurrence flow rate. With respect to the West Loch drainage basin, the project intends to collect all storm water and route it to the existing detention basin located on the east side of Fort Weaver Road and south of the OR&L railroad tracks.			
ECONOMIC USES			
Objective			
(A) Provide public or private facilities and improvements important to the State's economy in suitable locations.			
Policies			
(A) Concentrate coastal dependent development in appropriate areas;			X
(B) Ensure that coastal dependent development such as harbors and ports, and coastal related development such as visitor industry facilities and energy generating facilities, are located, designed, and constructed to minimize adverse social, visual, and environmental impacts in the coastal zone management area; and			X
(C) Direct the location and expansion of coastal dependent developments to areas presently designated and used for such developments and permit reasonable long-term growth at such areas, and permit coastal dependent development outside of presently designated areas when:			X
(i) Use of presently designated locations is not feasible;			X
(ii) Adverse environmental effects are minimized; and			X
(iii) The development is important to the State's economy.			X
Discussion: The Ho'opili project will provide various employment opportunities in the rapidly growing 'Ewa region. The project is located mauka of the shoreline and does not propose any coastal-dependent development. The land uses planned for the project are well inland of coastal areas, and coastal resources will not be affected. Visual impacts will be minimized, as the proposed development will be integrated with the surrounding topography, to the extent possible.			
COASTAL HAZARDS			

AR00027197

Coastal Zone Management Act, Chapter 205A, Hawaii Revised Statutes	S	N/S	N/A
Objective			
(A) Reduce hazard to life and property from tsunami, storm waves, stream flooding, erosion, subsidence, and pollution.			
Policies			
(A) Develop and communicate adequate information about storm wave, tsunami, flood, erosion, subsidence, and point and nonpoint source pollution hazards;			X
(B) Control development in areas subject to storm wave, tsunami, flood, erosion, hurricane, wind, subsidence, and point and nonpoint source pollution hazards;			X
(C) Ensure that developments comply with requirements of the Federal Flood Insurance Program; and			X
(D) Prevent coastal flooding from inland projects.			X
Discussion: The Ho'opili project will be designed and constructed in compliance with all applicable Federal, State, and County environmental protection, design, and building standards and regulations, including the Federal Flood Insurance Program. Drainage systems, in compliance with applicable State and County rules and regulations, will mitigate the existing flood hazard potential.			
MANAGING DEVELOPMENT			
Objective			
(A) Improve the development review process, communication, and public participation in the management of coastal resources and hazards.			
Policies			
(A) Use, implement, and enforce existing law effectively to the maximum extent possible in managing present and future coastal zone development;			X
(B) Facilitate timely processing of applications for development permits and resolve overlapping or conflicting permit requirements; and			X
(C) Communicate the potential short and long-term impacts of proposed significant coastal developments early in their life cycle and in terms understandable to the public to facilitate public participation in the planning and review process.			X
Discussion: No coastal areas or resources are expected to be affected by the proposed development. Applications for required land use entitlements for the proposed project will be reviewed by State and County agencies. Individuals, community groups (such as the Ho'opili Community Task Force), and appropriate County agency personnel have been consulted about the proposed project, and comments received have been incorporated into the planning process and into this document.			
PUBLIC PARTICIPATION			
Objective			
(A) Stimulate public awareness, education, and participation in coastal management.			
Policies			
(A) Promote public involvement in coastal zone management processes;			X
(B) Disseminate information on coastal management issues by means of educational materials, published reports, staff contact, and public workshops for persons and/or organizations concerned with coastal issues, developments, and government activities; and			X
(C) Organize workshops, policy dialogues, and site-specific mediations to respond to coastal issues and conflicts.			X
Discussion: The proposed project is not anticipated to impact coastal resources, nevertheless, the			

AR00027198

Coastal Zone Management Act, Chapter 205A, Hawaii Revised Statutes	S	N/S	N/A
Petitioner has consulted with various West O'ahu community groups in the formulation of the Ho'opili master plan. This planning effort produced a community-driven vision for the proposed development.			
BEACH PROTECTION			
Objective			
(A) Protect beaches for public use and recreation.			
Policies			
(A) Locate new structures inland from the shoreline setback to conserve open space, minimize interference with natural shoreline processes, and minimize loss of improvements due to erosion;			X
(B) Prohibit construction of private erosion-protection structures seaward of the shoreline, except when they result in improved aesthetic and engineering solutions to erosion at the sites and do not interfere with existing recreational and waterline activities; and			X
(C) Minimize the construction of public erosion-protection structures seaward of the shoreline.			X
Discussion: The Petition Area is not located on or near a beach, nor will it impact coastal resources.			
MARINE RESOURCES			
Objective			
(A) Promote the protection, use, and development of marine and coastal resources to assure their sustainability.			
Policies			
(A) Ensure that the use and development of marine and coastal resources are ecologically and environmentally sound and economically beneficial;			X
(B) Coordinate the management of marine and coastal resources and activities to improve effectiveness and efficiency;			X
(C) Assert and articulate the interests of the State as a partner with federal agencies in the sound management of ocean resources within the United States exclusive economic zone;			X
(D) Promote research, study, and understanding of ocean processes, marine life, and other ocean resources in order to acquire and inventory information necessary to understand how ocean development activities relate to and impact upon ocean and coastal resources; and			X
(E) Encourage research and development of new, innovative technologies for exploring, using, or protecting marine and coastal resources.			X
Discussion: Since the Petition Area is located away from the shoreline, no coastal or marine resources will be impacted.			

AR00027199

5.2.5 Hawaii State Plan, Chapter 226, Hawaii Revised Statutes

The *Hawaii State Plan* (Chapter 226, HRS), which serves as a guide for the long-range growth and development of the State, establishes a set of goals, objectives, policies, and priorities for the State. The *Hawaii State Plan* can be divided into three parts: Part I (Overall Theme, Goals, Objectives and Policies); Part II (Planning, Coordination and Implementation); and Part II (Priority Guidelines). The project's conformance to the *Hawaii State Plan* is listed below in Tables 5.4 and 5.5.

Table 5.4. Hawaii State Plan, Chapter 226, Hawaii Revised Statutes – Part I. Overall Theme, Goals, Objectives and Policies

Hawaii State Plan, Chapter 226, Hawaii Revised Statutes – Part I. Overall Theme, Goals, Objectives and Policies	S	N/S	N/A
HRS § 226-1: Findings and Purpose			
HRS § 226-2: Definitions			
HRS § 226-3: Overall Theme			
HRS § 226-4: State Goals. In order to guarantee, for the present and future generations, those elements of choice and mobility that insure that individuals and groups may approach their desired levels of self-reliance and self-determination, it shall be the goal of the State to achieve:			
1) A strong, viable economy, characterized by stability, diversity and growth that enable fulfillment of the needs and expectations of Hawaii's present and future generations.	X		
2) A desired physical environment, characterized by beauty, cleanliness, quiet, stable natural systems, and uniqueness, that enhances the mental and physical well-being of the people.	X		
3) Physical, social and economic well-being, for individuals and families in Hawaii, that nourishes a sense of community responsibility, of caring and of participation in community life.	X		
Discussion: The proposed project is consistent with the State's goal to insure economic stability, diversity, and growth for present and future generations. The Ho'opili project will provide various housing and employment opportunities for the rapidly growing 'Ewa region, which will in turn, relieve development pressures from other areas of O'ahu, particularly the Primary Urban Center, and rural areas such as Wai'anae, North Shore, Ko'olau Loa and Ko'olau Poko.			
HRS § 226-5: Objectives and policies for population.			
(a) It shall be the objective in planning for the State's population to guide population growth to be consistent with the achievement of physical, economic and social objectives contained in this chapter;			
(b) To achieve the population objective, it shall be the policy of this State to:			
(1) Manage population growth statewide in a manner that provides increased opportunities for Hawaii's people to pursue their physical, social and economic aspirations while recognizing the unique needs of each County.	X		
(2) Encourage an increase in economic activities and employment opportunities on the neighbor islands consistent with community needs and desires.			X
(3) Promote increased opportunities for Hawaii's people to pursue	X		

AR00027200

Hawaii State Plan, Chapter 226, Hawaii Revised Statutes – Part I. Overall Theme, Goals, Objectives and Policies	S	N/S	N/A
their socio-economic aspirations throughout the islands.			
(4) Encourage research activities and public awareness programs to foster an understanding of Hawaii's limited capacity to accommodate population needs and to address concerns resulting from an increase in Hawaii's population.			X
(5) Encourage federal actions and coordination among major governmental agencies to promote a more balanced distribution of immigrants among the states, provided that such actions do not prevent the reunion of immediate family members.			X
(6) Pursue an increase in federal assistance for states with a greater proportion of foreign immigrants relative to their state's population.			X
(7) Plan the development and availability of land and water resources in a coordinated manner so as to provide for the desired levels of growth in each geographic area.	X		
Discussion: According to the City and County of Honolulu Department of Planning and Permitting (DPP), the year 2006 population of the *Ewa Development Plan Area* (DPA) was 86,000 (DPP, 2006). This represented an increase of 25.1 percent from its 2000 population of 68,718. The DPP expects the population of the Ewa DPA to increase to 180,200 by the year 2030. In comparison, the population for the City and County of Honolulu as a whole increased only 3.8 percent from 876,156 to 909,863 between 2000 and 2006. The City and County of Honolulu is expected to experience a population growth of 27.5 percent (241,144 persons) from 876,156 to 1,117,300 total residents during the same 30-year period (2000 to 2030). Besides providing substantial housing opportunities for the 'Ewa region, the Ho'opili project also supports the State's population distribution policies.			
HRS § 226-6: Objectives and policies for the economy in general.			
(a) Planning for the State's economy in general shall be directed toward achievement of the following objectives:			
(1) Increased and diversified employment opportunities to achieve full employment, increased income and job choice, and improved living standards for Hawaii's people.	X		
(2) A steadily growing and diversified economic base that is not overly dependent on a few industries, and includes the development and expansion of industries on the neighbor islands.	X		
(b) To achieve the general economic objectives, it shall be the policy of this State to:			
(1) Expand Hawaii's national and international marketing, communication, and/or organizational ties, to increase the State's capacity to adjust to and capitalize upon economic changes and opportunities occurring outside the State.			X
(2) Promote Hawaii as an attractive market for environmentally and socially sound investment activities that benefit Hawaii's people.			X
(3) Seek broader outlets for new or expanded Hawaii business investments.			X
(4) Expand existing markets and penetrate new markets for Hawaii's products and services.	X		
(5) Assure that the basic economic needs of Hawaii's people are maintained in the event of disruptions in overseas transportation.			X
(6) Strive to achieve a level of construction activity responsive to, and consistent with, state growth objectives.	X		
(7) Encourage the formation of cooperatives and other favorable			X

Hawaii State Plan, Chapter 226, Hawaii Revised Statutes – Part I. Overall Theme, Goals, Objectives and Policies	S	N/S	N/A
marketing arrangements at the local or regional level to assist Hawaii's small scale producers, manufacturers, and distributors.			
(8) Encourage labor-intensive activities that are economically satisfying and which offer opportunities for upward mobility.			X
(9) Foster greater cooperation and coordination between the government and private sectors in developing Hawaii's employment and economic growth opportunities.	X		
(10) Stimulate the development and expansion of economic activities which will benefit areas with substantial or expected employment problems.	X		
(11) Maintain acceptable working conditions and standards for Hawaii's workers.	X		
(12) Provide equal employment opportunities for all segments of Hawaii's population through affirmative action and nondiscrimination measures.	X		
(13) Encourage businesses that have favorable financial multiplier effects within Hawaii's economy.	X		
(14) Promote and protect intangible resources in Hawaii, such as scenic beauty and the aloha spirit, which are vital to a healthy economy.	X		
(15) Increase effective communication between the educational community and the private sector to develop relevant curricula and training programs to meet future employment needs in general, and requirements of new, potential growth industries in particular.			X
(16) Foster a business climate in Hawaii--including attitudes, tax and regulatory policies, and financial and technical assistance programs--that is conducive to the expansion of existing enterprises and the creation and attraction of new business and industry.			X
Discussion: The Ho'opili project will provide for a diverse range of direct and indirect employment and economic opportunities for Hawai'i residents, both during and after project construction. Short-term construction-related jobs as well as permanent long-term operational jobs will be offered, increasing employment throughout the 'Ewa region and State. With greater employment and economic opportunities, the overall living standards and lifestyles will be enhanced for area residents, who will be able to live, work, learn, play, and shop within the Second City.			
HRS § 226-7: Objectives and policies for the economy - agriculture			
(a) Planning for the State's economy with regard to agriculture shall be directed towards achievement of the following objectives:			
(1) Viability of Hawaii's sugar and pineapple industries.			X
(2) Growth and development of diversified agriculture throughout the State.		X	
(3) An agriculture industry that continues to constitute a dynamic and essential component of Hawaii's strategic, economic, and social well-being.			X
(b) To achieve the agriculture objectives, is shall be the policy of this State to:			
(1) Establish a clear direction for Hawaii's agriculture through stakeholder commitment and advocacy.			X
(2) Encourage agriculture by making best use of natural resources.			X
(3) Provide the governor and the legislature with information and			X

AR00027202

Hawaii State Plan, Chapter 226, Hawaii Revised Statutes – Part I. Overall Theme, Goals, Objectives and Policies	S	N/S	N/A
options needed for prudent decision making for the development of agriculture.			
(4) Establish strong relationships between the agricultural and visitor industries for mutual marketing benefits.			X
(5) Foster increased public awareness and understanding of the contributions and benefits of agriculture as a major sector of Hawaii's economy.			X
(6) Seek the enactment and retention of federal and state legislation that benefits Hawaii's agricultural industries.			X
(7) Strengthen diversified agriculture by developing an effective promotion, marketing, and distribution system between Hawaii's producers and consumer markets locally, on the continental United States, and internationally.			X
(8) Support research and development activities that provide greater efficiency and economic productivity in agriculture.			X
(9) Enhance agricultural growth by providing public incentives and encouraging private initiatives.			X
(10)Assure the availability of agriculturally suitable lands with adequate water to accommodate present and future needs.			X
(11) Increase the attractiveness and opportunities for an agricultural education and livelihood.			X
(12)Expand Hawaii's agricultural base by promoting growth and development of flowers, tropical fruits and plants, livestock, feed grains, forestry, food crops, aquaculture, and other potential enterprises.			X
(13)Promote economically competitive activities that increase Hawaii's agricultural self-sufficiency.			X
(14)Promote and assist in the establishment of sound financial programs for diversified agriculture.			X
(15)Institute and support programs and activities to assist the entry of displaced agricultural workers into alternative agricultural or other employment.			X
(16)Facilitate the transition of agricultural lands in economically nonfeasible agricultural production to economically viable agricultural uses.			X

Discussion: The agricultural policies are predominantly not applicable to the Ho'opili project. These policies were developed prior to the contraction of the sugarcane and pineapple industries, and as such, in the post "plantation" era, there is an abundant supply of land available for diversified agriculture.

The Ho'opili project lies within the State Agricultural District (See Figure 2.4: State Land Use District). As such, a State Land Use District Boundary Amendment will be sought to change the site from the Agricultural District to the Urban District. The proposed State Land Use District Boundary Amendment is consistent with the standards for determining boundaries of the Urban District as the majority of adjacent lands that surround the Petition Area are within the Urban District. The Petition Area lies within the City and County of Honolulu's Ewa DP Urban Growth Boundary, and as such, reclassification of the Petition Area to the Urban District and subsequent City and County of Honolulu Change of Zone application would permit the Petition Area to conform to the surrounding land uses and would permit the low- to medium-density residential uses.

AR00027203

Hawaii State Plan, Chapter 226, Hawaii Revised Statutes – Part I. Overall Theme, Goals, Objectives and Policies	S	N/S	N/A
HRS § 226-8: Objectives and policies for the economy – visitor industry			
(a) Planning for the State's economy with regard to the visitor industry shall be directed towards the achievement of the objective of a visitor industry that constitutes a major component of steady growth for Hawaii's economy.			
(b) To achieve the visitor industry objective, it shall be the policy of this State to:			
(1) Support and assist in the promotion of Hawaii's visitor attractions and facilities.			X
(2) Ensure that visitor industry activities are in keeping with the social, economic, and physical needs and aspirations of Hawaii's people.			X
(3) Improve the quality of existing visitor destination areas.			X
(4) Encourage cooperation and coordination between the government and private sectors in developing and maintaining well-designed, adequately serviced visitor industry and related developments which are sensitive to neighboring communities and activities.			X
(5) Develop the industry in a manner that will continue to provide new job opportunities and steady employment for Hawaii's people.			X
(6) Provide opportunities for Hawaii's people to obtain job training and education that will allow for upward mobility within the visitor industry.			X
(7) Foster a recognition of the contribution of the visitor industry to Hawaii's economy and the need to perpetuate the aloha spirit.			X
(8) Foster an understanding by visitors of the aloha spirit and of the unique and sensitive character of Hawaii's cultures and values.			X
Discussion: While the State's policies related to the economy and visitor industry are not directly applicable to the Ho'opili project, the Petitioner supports the State's objectives.			
HRS § 226-9: Objective and policies for the economy – federal expenditures			
(a) Planning for the State's economy with regard to federal expenditures shall be directed towards achievement of the objective of a stable federal investment base as an integral component of Hawaii's economy.			
(b) To achieve the federal expenditures objective, it shall be the policy of this State to:			
(1) Encourage the sustained flow of federal expenditures in Hawaii that generates long-term government civilian employment.			X
(2) Promote Hawaii's supportive role in national defense.			X
(3) Promote the development of federally supported activities in Hawaii that respect state-wide economic concerns, are sensitive to community needs, and minimize adverse impacts on Hawaii's environment.			X
(4) Increase opportunities for entry and advancement of Hawaii's people into federal government service.			X
(5) Promote federal use of local commodities, services, and facilities available in Hawaii.			X
(6) Strengthen federal-state-county communication and coordination in all federal activities that affect Hawaii.			X
(7) Pursue the return of federally controlled lands in Hawaii that are not required for either the defense of the nation or for other purposes of national importance, and promote the mutually beneficial exchanges of land between federal agencies, the State,			X

AR00027204

Hawaii State Plan, Chapter 226, Hawaii Revised Statutes – Part I. Overall Theme, Goals, Objectives and Policies	S	N/S	N/A
and the counties.			
Discussion: While the State's policies related to the economy and federal expenditures are not directly applicable to the Ho'opili project, the Petitioner supports the State's objectives.			
HRS § 226-10: Objectives and policies for the economy – potential growth activities.			
(a) Planning for the State's economy with regard to potential growth activities shall be directed towards achievement of the objective of development and expansion of potential growth activities that serve to increase and diversify Hawaii's economic base.			
(b) To achieve the information industry objective, it shall be the policy of this State to:			
(1) Facilitate investment and employment in economic activities that have the potential for growth such as diversified agriculture, aquaculture, apparel and textile manufacturing, film and television production, and energy and marine-related industries.			X
(2) Expand Hawaii's capacity to attract and service international programs and activities that generate employment for Hawaii's people.			X
(3) Enhance and promote Hawaii's role as a center for international relations, trade, finance, services, technology, education, culture, and the arts.			X
(4) Accelerate research and development of new energy-related industries based on wind, solar, ocean, and underground resources and solid waste.			X
(5) Promote Hawaii's geographic, environmental, social, and technological advantages to attract new economic activities into the State.			X
(6) Provide public incentives and encourage private initiative to attract new industries that best support Hawaii's social, economic, physical, and environmental objectives.			X
(7) Increase research and the development of ocean-related economic activities such as mining, food production, and scientific research.			X
(8) Develop, promote, and support research and educational and training programs that will enhance Hawaii's ability to attract and develop economic activities of benefit to Hawaii.			X
(9) Foster a broader public recognition and understanding of the potential benefits of new, growth-oriented industry in Hawaii.			X
(10)Encourage the development and implementation of joint federal and state initiatives to attract federal programs and projects that will support Hawaii's social, economic, physical, and environmental objectives.			X
Discussion: While the State's policies related to the economy and potential growth activities are not directly applicable to the Ho'opili project, the Petitioner supports the State's objectives.			
HRS § 226-10.5: Objectives and policies for the economy – information industry			
(a) Planning for the State's economy with regard to the information industry shall be directed toward the achievement of the objective of positioning Hawaii as the leading dealer in information businesses and services in the Pacific Rim.			
(b) To achieve the information industry objective, it shall be the policy of this State to:			
(1) Encourage the continued development and expansion of the telecommunications infrastructure serving Hawaii to accommodate			X

AR00027205

Hawaii State Plan, Chapter 226, Hawaii Revised Statutes – Part I. Overall Theme, Goals, Objectives and Policies	S	N/S	N/A
future growth in the information industry;			
(2) Facilitate the development of new business and service ventures in the information industry which will provide employment opportunities for the people of Hawaii;			X
(3) Encourage greater cooperation between the public and private sectors in developing and maintaining a well- designed information industry;			X
(4) Ensure that the development of new businesses and services in the industry are in keeping with the social, economic, and physical needs and aspirations of Hawaii's people;			X
(5) Provide opportunities for Hawaii's people to obtain job training and education that will allow for upward mobility within the information industry;			X
(6) Foster a recognition of the contribution of the information industry to Hawaii's economy; and			X
(7) Assist in the promotion of Hawaii as a broker, creator, and processor of information in the Pacific.			X
Discussion: While the State's policies related to the economy and information industry are not directly applicable to the Ho'opili project, the Petitioner supports the State's objectives.			
HRS § 226-11: Objectives and policies for the physical environment – land-based, shoreline, and marine resources.			
(a) Planning for the State's physical environment shall be directed towards achievement of the objective of enhancement of Hawaii's scenic assets, natural beauty, and multi-cultural/historical resources.			
(1) Prudent use of Hawaii's land-based, shoreline, and marine resources.	X		
(2) Effective protection of Hawaii's unique and fragile environmental resources.			X
(b) To achieve the land-based, shoreline, and marine resources objectives, it shall be the policy of this State to:			
(1) Exercise an overall conservation ethic in the use of Hawaii's natural resources.	X		
(2) Ensure compatibility between land-based and water-based activities and natural resources and ecological systems.	X		
(3) Take into account the physical attributes of areas when planning and designing activities and facilities.	X		
(4) Manage natural resources and environs to encourage their beneficial and multiple use without generating costly or irreparable environmental damage.	X		
(5) Consider multiple uses in watershed areas, provided such uses do not detrimentally affect water quality and recharge functions.			X
(6) Encourage the protection of rare or endangered plant and animal species and habitats native to Hawaii.	X		
(7) Provide public incentives that encourage private actions to protect significant natural resources from degradation or unnecessary depletion.			X
(8) Pursue compatible relationships among activities, facilities, and natural resources.	X		

AR00027206

Hawaii State Plan, Chapter 226, Hawaii Revised Statutes – Part I. Overall Theme, Goals, Objectives and Policies	S	N/S	N/A
(9) Promote increased accessibility and prudent use of inland and shoreline areas for public recreational, educational, and scientific purposes.	X		
Discussion: Most new development on O'ahu is being directed toward the 'Ewa region, as its physical attributes are compatible with urban development. The physical, environmental, and cultural attributes of the proposed project site are compatible with the land uses proposed. This EIS identifies existing natural and physical site conditions (i.e., slope, soils, drainage characteristics, archaeological sites, flora and fauna, public services and infrastructure) and potential impacts resulting from the Ho'opili project, and proposes measures to mitigate potential impacts.			
HRS § 226-12: Objectives and policies for the physical environment – scenic, natural beauty, and historic resources.			
(a) Planning for the State's physical environment shall be directed towards achievement of the objective of enhancement of Hawaii's scenic assets, natural beauty, and multi-cultural/historical resources.			
(b) To achieve the scenic, natural beauty, and historic resources objectives, it shall be the policy of this State to:			
(1) Promote the preservation and restoration of significant natural and historic resources.	X		
(2) Provide incentives to maintain and enhance historic, cultural, and scenic amenities.	X		
(3) Promote the preservation of views and vistas to enhance the visual and aesthetic enjoyment of mountains, ocean, scenic landscapes, and other natural features.	X		
(4) Protect those special areas, structures, and elements that are an integral and functional part of Hawaii's ethnic and cultural heritage.	X		
(5) Encourage the design of developments and activities that complement the natural beauty of the islands.	X		
Discussion: The archaeological inventory survey report has been accepted by SHPD in fulfillment of Section 13-284 and 13-276, HAR (See Appendix E). A preservation plan and archaeological monitoring plan will be prepared and submitted to SHPD for its review and approval. Should any archaeologically significant artifacts, bones, or other indicators of previous on-site activity be uncovered during the construction phases of development, construction will halt and archaeological resources will be treated in strict compliance with the requirements of the DLNR. Due to the flat topography of the property and adjacent lands, existing views across the site are possible only from surrounding elevated areas such as breaks along the high speed H-1 Freeway. It is acknowledged that the project will alter the character of the existing landscape from open, cultivated fields to long-planned urban development bisected by elevated rail transit. However, similar plans are being proposed by both UHWO and DHHL on surrounding lands..			
HRS § 226-13: Objectives and policies for the physical environment – land, air, and water quality.			
(a) Planning for the State's physical environment with regard to land, air, and water quality shall be directed towards achievement of the following objectives:			
(1) Maintenance and pursuit of improved quality in Hawaii's land, air, and water resources.	X		
(2) Greater public awareness and appreciation of Hawaii's environmental resources.	X		
(b) To achieve the land, air, and water quality objectives, it shall be the policy of this State to:			

AR00027207

Hawaii State Plan, Chapter 226, Hawaii Revised Statutes – Part I. Overall Theme, Goals, Objectives and Policies	S	N/S	N/A
(1) Foster educational activities that promote a better understanding of Hawaii's limited environmental resources.			X
(2) Promote the proper management of Hawaii's land and water resources.	X		
(3) Promote effective measures to achieve desired quality in Hawaii's surface, ground, and coastal waters.	X		
(4) Encourage actions to maintain or improve aural and air quality levels to enhance the health and well-being of Hawaii's people.	X		
(5) Reduce the threat to life and property from erosion, flooding, tsunamis, hurricanes, earthquakes, volcanic eruptions, and other natural or man-induced hazards and disasters.	X		
(6) Encourage design and construction practices that enhance the physical qualities of Hawaii's communities.	X		
(7) Encourage urban developments in close proximity to existing services and facilities.	X		
(8) Foster recognition of the importance and value of the land, air, and water resources to Hawaii's people, their cultures and visitors.			X
Discussion: The Petitioner recognizes the importance of complying with applicable Federal, State, and County regulations relating to the area's land, air, and water resources. The project is not anticipated to have direct long-term impacts on the quality of land, air, and water resources. Drainage systems, in compliance with applicable State and County rules and regulations, will mitigate the existing flood hazard potential. The potential flood hazard on the property will be mitigated by the development of a system of detention facilities that comply with County drainage regulations. The occurrence of natural hazards such as hurricane, earthquake, and volcanic eruption exist, but are no more likely to affect the property than any other location in the 'Ewa region. The Ho'opili project is surrounded by or in close proximity to existing and planned developments, services and facilities. It is situated between H-1 Freeway (north) and Mango Tree Road (south), and between the planned North-South Road (west) and Old Fort Weaver Road (east). Existing urban uses occur to the south ('Ewa Villages) and east (Honouliuli). New development is planned and/or being constructed to the west (UHWO and DHHL). All new infrastructure and infrastructure improvements will be sized and engineered to accommodate the proposed development.			
HRS § 226-14: Objective and policies for facility systems – in general			
(a) Planning for the State's facility systems in general shall be directed towards achievement of the objective of water, transportation, waste disposal, and energy and telecommunication systems that support statewide social, economic, and physical objectives.			
(b) To achieve the general facility systems objective, it shall be the policy of this State to:			
(1) Accommodate the needs of Hawaii's people through coordination of facility systems and capital improvement priorities in consonance with state and county plans.	X		
(2) Encourage flexibility in the design and development of facility systems to promote prudent use of resources and accommodate changing public demands and priorities.	X		
(3) Ensure that required facility systems can be supported within resource capacities and at reasonable cost to the user.	X		
(4) Pursue alternative methods of financing programs and projects and cost-saving techniques in the planning, construction, and	X		

AR00027208

Hawaii State Plan, Chapter 226, Hawaii Revised Statutes – Part I. Overall Theme, Goals, Objectives and Policies	S	N/S	N/A
maintenance of facility systems.			
Discussion: The Ho'opili project will comply with State and County rules and regulations regarding facility system objectives.			
HRS § 226-15: Objectives and policies for facility systems – solid and liquid wastes.			
(a) Planning for the State's facility systems with regard to solid and liquid wastes shall be directed towards the achievement of the following objectives:			
(1) Maintenance of basic public health and sanitation standards relating to treatment and disposal of solid and liquid wastes.	X		
(2) Provision of adequate sewerage facilities for physical and economic activities that alleviate problems in housing, employment, mobility, and other areas.	X		
(b) To achieve the solid and liquid waste objectives, it shall be the policy of this State to:			
(1) Encourage the adequate development of sewerage facilities that complement planned growth.	X		
(2) Promote re-use and recycling to reduce solid and liquid wastes and employ a conservation ethic.	X		
(3) Promote research to develop more efficient and economical treatment and disposal of solid and liquid wastes.			X
Discussion: A gravity wastewater collection system will be designed to City and County standards and ultimately dedicated to the County to serve the project. The point of connection to off-site collection systems will be at the southern boundary of Parcel C and at the common property line with DHHL. The wastewater will be conveyed to Honouliuli WWTP, and therefore, to mitigate the additional burden, the project will participate in the WSFC program and contribute funds to expand the treatment plant. Regarding solid waste, the City and County of Honolulu is restarting its curbside pick up recycling program. In November 2007, two pilot curbside recycling programs began in Mililani and Hawai'i Kai. During the six to twelve month evaluation period, the City and County of Honolulu Department of Environmental Services staff will be coordinating plans for island wide expansion. On June 27, 2008, the Associated Press reported that Mililani and Hawai'i Kai residents have recycled 54 percent of their cans, bottles, newspapers and green waste during the city's six-month curbside recycling pilot project. City Officials with the City and County of Honolulu Department of Environmental Services (DES) are reportedly satisfied with the results and are moving forward with plans to provide some 160,000 O'ahu homes the curbside recycling service by May 2010. In the new plan, the city will collect garbage and recyclables each once a week. The DES will no longer have garbage pickup twice-weekly. A study released by DES predicts the program will divert an estimated 53,800 tons of mixed recyclables and green waste from O'ahu landfills. They plan to begin expanding the program to more communities in November 2008.			
HRS § 226-16: Objectives and policies for facility systems – water.			
(a) Planning for the State's facility systems with regard to water shall be directed towards achievement of the objective of the provision of water to adequately accommodate domestic, agricultural, commercial, industrial, recreational, and other needs within resource capacities.			
(b) To achieve the facility systems water objective, it shall be the policy of this State to:			
(1) Coordinate development of land use activities with existing and potential water supply.	X		
(2) Support research and development of alternative methods to meet			X

AR00027209

Hawaii State Plan, Chapter 226, Hawaii Revised Statutes – Part I. Overall Theme, Goals, Objectives and Policies	S	N/S	N/A
future water requirements well in advance of anticipated needs.			
(3) Reclaim and encourage the productive use of runoff water and wastewater discharges.	X		
(4) Assist in improving the quality, efficiency, service, and storage capabilities of water systems for domestic and agricultural use.	X		
(5) Support water supply services to areas experiencing critical water problems.	X		
(6) Promote water conservation programs and practices in government, private industry, and the general public to help ensure adequate water to meet long-term needs.	X		

Discussion: The total average daily source requirement for ultimate build-out is estimated at 3.9 MGD. The future water demand from the proposed project is based on standard civil engineering methodology; it is possible that with the implementation of feasible water conservation appliances, future water demand from the project may be lessened. During the public review period, the BWS wrote: "The developer should also consider rain barrel catchments, water-efficient front- load washer appliances and ultra low-flow toilets." It is intended that source (well supply) would be provided by BWS from existing sources. Although BWS cannot reserve water for future projects, it has indicated that there is water available to meet the estimated water demand for the project (3.9 MGD). Water Facility Charges paid by the Petitioner will be used by the Board to assist in the source replenishment caused by the project's water demands.

New water system demands will require that the Petitioner provide system upgrades to the transmission and storage components to ensure that the system operates effectively and meets BWS standards. These upgrades are described in detail in Section 4.8.2 of this EIS.

With respect to non-potable water requirements, the project will be maximizing non-drinking water usage to minimize the demand on the safe drinking water system. If a suitable supply is made available, ~~S~~street right of ways of the Ho'opili project will have underground non-drinking water distribution systems. It is proposed to upgrade the existing non-drinking water source (EP 5 & 6 located within Parcel C) to a BWS dedicable standard to be used as the source for the non-drinking system. It is also proposed to ultimately allow for future dedication of the non-drinking water system. It is estimated that the ultimate non-drinking water demand for the project will be approximately 2.1 MGD. The Petitioner will consider the use of drought tolerant/low water use plants and the implementation of xeriscaping principles for landscaping within the Ho'opili project to the extent practicable. The installation of an efficient irrigation system, possibly using drip irrigation, will be considered in the design of the project where feasible. Moisture sensors to avoid the operation of the system in the rain and if the ground has adequate moisture would be incorporated into the irrigation system, where feasible.

Another source of non-potable water is reclaimed water. The Honolulu Board of Water Supply (BWS) entered into the water recycling business in 2000 by purchasing the Honouliuli Water Reclamation Facility. Water recycling is one element of a broader BWS strategy to protect O'ahu's aquifers and to conserve water resources through conservation and development of new water supplies. The facility is now irrigating golf courses that were once using brackish water, including West Loch, 'Ewa Villages, Hawai'i Prince, and Coral Creek. The facility is also providing recycled water (at a different level of treatment) to industries at Campbell Industrial Park. The project's main source of non-potable water is still intended to be the caprock aquifer (EP 5 & 6), but the potential use of reclaimed water is being identified as an alternate option.

The project will be maximizing the use of non-potable water for irrigation to minimize the impact

AR00027210

Hawaii State Plan, Chapter 226, Hawaii Revised Statutes – Part I. Overall Theme, Goals, Objectives and Policies	S	N/S	N/A
on the source component of the BWS system. It is proposed that the project's greenbelts, parks and roadway medians use non-potable water for irrigation, if a suitable supply will be available. The BWS Water Resources Division will be contacted regarding the availability of recycled water and other non-potable water supplies. A Conceptual Water Master Plan addressing safe drinking and non-potable water facilities has been prepared and reproduced in its entirety and attached to this EIS as Appendix M ~~will be submitted to~~ for BWS ~~for its~~ review and approval. In addition, construction drawings will be submitted to BWS for its review and approval. During the public review period of the Draft EIS, the DLNR Commission on Water Resource Management requested that "the reuse of storm water and installation of water efficient fixtures be considered" and recommended "the use of xeriscaping and the planting of drought tolerant and salt-tolerant plans to conserve water supplies."			
HRS § 226-17: Objectives and policies for facility systems – transportation.			
(a) Planning for the State's facility systems with regard to transportation shall be directed toward the achievement of the following objectives, giving due consideration to all:			
(1) An integrated multi-modal transportation system that services statewide needs and promotes the efficient, economical, safe, and convenient movement of people and goods.	X		
(2) A statewide transportation system that is consistent with and will accommodate planned growth objectives throughout the State.	X		
(b) To achieve the transportation objectives, it shall be the policy of this State to:			
(1) Design, program, and develop a multi-modal system in conformance with desired growth and physical development as stated in this chapter;	X		
(2) Coordinate state, county, federal, and private transportation activities and programs toward the achievement of statewide objectives;			X
(3) Encourage a reasonable distribution of financial responsibilities for transportation among participating governmental and private parties;	X		
(4) Provide for improved accessibility to shipping, docking, and storage facilities;			X
(5) Promote a reasonable level and variety of mass transportation services that adequately meet statewide and community needs;	X		
(6) Encourage transportation systems that serve to accommodate present and future development needs of communities;	X		
(7) Encourage a variety of carriers to offer increased opportunities and advantages to interisland movement of people and goods;			X
(8) Increase the capacities of airport and harbor systems and support facilities to effectively accommodate transshipment and storage needs;			X
(9) Encourage the development of transportation systems and programs which would assist statewide economic growth and diversification;	X		
(10)Encourage the design and development of transportation systems sensitive to the needs of affected communities and the quality of Hawaii's natural environment;	X		
(11)Encourage safe and convenient use of low-cost, energy-efficient, non-polluting means of transportation;	X		
(12)Coordinate intergovernmental land use and transportation planning activities to ensure the timely delivery of supporting transportation			X

AR00027211

Hawaii State Plan, Chapter 226, Hawaii Revised Statutes – Part I. Overall Theme, Goals, Objectives and Policies	S	N/S	N/A
infrastructure in order to accommodate planned growth objectives; and			
(13)Encourage diversification of transportation modes and infrastructure to promote alternate fuels and energy efficiency.	X		
Discussion: The proposed project has been designed to accommodate an integrated multi-modal transportation system, including high capacity (elevated rail) transit, bus, automobile, bicycle and pedestrian modes of travel.			
HRS § 226-18: Objectives and policies for facility systems – energy.			
(a) Planning for the State's facility systems with regard to energy shall be directed toward the achievement of the following objectives, giving due consideration to all:			
(1) Dependable, efficient, and economical statewide energy systems capable of supporting the needs of the people;	X		
(2) Increased energy self-sufficiency where the ratio of indigenous to imported energy use is increased;	X		
(3) Greater energy security in the face of threats to Hawaii's energy supplies and systems; and			X
(4) Reduction, avoidance, or sequestration of greenhouse gas emissions from energy supply and use.	X		
(b) To achieve the energy objectives, it shall be the policy of this State to ensure the provision of adequate, reasonably priced, and dependable energy services to accommodate demand.			
(c) To further achieve the energy objectives, it shall be the policy of this State to:			
(1) Support research and development as well as promote the use of renewable energy sources;			X
(2) Ensure that the combination of energy supplies and energy-saving systems is sufficient to support the demands of growth;			X
(3) Base decisions of least-cost supply-side and demand-side energy resource options on a comparison of their total costs and benefits when a least-cost is determined by a reasonably comprehensive, quantitative, and qualitative accounting of their long-term, direct and indirect economic, environmental, social, cultural, and public health costs and benefits;			X
(4) Promote all cost-effective conservation of power and fuel supplies through measures including:	X		
(A) Development of cost-effective demand-side management programs;	X		
(B) Education; and	X		
(C) Adoption of energy-efficient practices and technologies;	X		
(5) Ensure to the extent that new supply-side resources are needed, the development or expansion of energy systems utilizes the least-cost energy supply option and maximizes efficient technologies;			X
(6) Support research, development, and demonstration of energy efficiency, load management, and other demand-side management programs, practices, and technologies;			X
(7) Promote alternate fuels and energy efficiency by encouraging diversification of transportation modes and infrastructure;	X		
(8) Support actions that reduce, avoid, or sequester greenhouse gases in utility, transportation, and industrial sector applications; and	X		
(9) Support actions that reduce, avoid, or sequester Hawaii's			X

AR00027212

Hawaii State Plan, Chapter 226, Hawaii Revised Statutes – Part I. Overall Theme, Goals, Objectives and Policies	S	N/S	N/A
greenhouse gas emissions through agriculture and forestry initiatives.			

Discussion: Sustainability options are being considered for the Ho'opili project.

Project buildings, activities, and site grounds are planned to be designed with energy-saving considerations, and the project will strive to be consistent with the State's objective to promote cost-effective energy conservation through the adoption of energy-efficient practices and technologies. Due to the sunny climate, the project will be suited for the use of renewable energy technologies including photovoltaics. During the public review period, the Office of Hawaiian Affairs wrote: "…OHA recommends the use of not only photovoltaic cells but also small wind harvesting electrical generation for peripheral uses such as parking lot lighting."

According to the American Wind Energy Association, small wind energy systems typically range from $3,000 to $5,000 for every kW (kilowatt) of generating capacity, or about $40,000 for a 10 kW system (installed). According to the Hawaiian Electric Company (HECO), wind generation energy resources typically cost approximately $.08 to $.11/kW per hour, however these rates apply to larger wind systems (wind farms) as opposed to individual wind systems whose rates are not readily available by HECO.

Photovoltaic (PV) systems range in price from $8,250 for a one-kW system to more than $40,000 for a five-kW system. According to HECO, internal estimates for photovoltaic (PV) energy resources typically cost approximately $.30 to $.40/kW per hour.

The average energy consumption by a single-family residence in Hawai'i is approximately 600 kW per hour. According to HECO, "Non-firm sources, such as wind and solar, are called "as-available" resources and must be backed up by firm generation to ensure electricity is available when customers need it -- 24 hours a day, regardless of whether the wind is blowing or the sun is shining."

"In addition to not being available 24-hours-a-day, the variability of wind, typical of the trade winds in Hawaii, can cause power problems. It can affect the quality of power produced. Today, a lot of sensitive electronic equipment can be damaged or disrupted by the variability of power produced from sources like the wind. These fluctuations can also place a big strain on the utility's fossil fuel generators if they have to kick in and meet the demand for electricity when the wind power is suddenly not available."

Even when "as-available" resources are available, HECO still needs to cut back on "as-available" renewable energy sources during off-peak periods of electricity use. This is due to scenarios where customer demand for power drops too low, generation must be turned off to cut back on power production. Otherwise, the electric system could potentially overload and become unstable. Furthermore, fossil-fuel generation can only be reduced so much. This on-and-off cycling could lead to damage and accelerated deterioration of fossil-fuel generators. It also causes the generators to burn more fuel than necessary which leads to an increased cost of electricity.

In June 2008, Governor Lingle signed SB 644 which requires that solar water heaters be required before issuance of a building permit on or after January 2010 for single-family residences.

In addition, based on the Department of Business, Economic Development & Tourism (DBEDT), Strategic Industries Division's recommendations, Ho'opili's mechanical and electrical consultants, in consultation with its sustainability consultant, will be directed to review the City and County of

AR00027213

Hawaii State Plan, Chapter 226, Hawaii Revised Statutes – Part I. Overall Theme, Goals, Objectives and Policies	S	N/S	N/A
Honolulu's Energy Code early in the project and to consult with Hawaiian Electric Company, Inc. (HECO) on demand-side management programs that offer rebates for installation of energy-efficient technologies.			
HRS § 226-18.5: Objectives and policies for facility systems—telecommunications.			
(a) Planning for the State's telecommunications facility systems shall be directed towards the achievement of dependable, efficient, and economical statewide telecommunications systems capable of supporting the needs of the people.			
(b) To achieve the telecommunications objective, it shall be the policy of this State to ensure the provision of adequate, reasonably priced, and dependable telecommunications services to accommodate demand.			
(c) To further achieve the telecommunications objective, it shall be the policy of this State to:			
(1) Facilitate research and development of telecommunications systems and resources;			X
(2) Encourage public and private sector efforts to develop means for adequate, ongoing telecommunications planning;			X
(3) Promote efficient management and use of existing telecommunications systems and services; and	X		
(4) Facilitate the development of education and training of telecommunications personnel.			X
Discussion: While the State's policies related to telecommunication systems are not directly applicable to the Ho'opili project, the Petitioner will incorporate the latest technologies in telecommunications as an amenity to attract buyers to the project, and it is likely that competing telecommunications companies will offer updated services in order to attract customers.			
HRS § 226-19: Objectives and policies for socio-cultural advancement – housing.			
(a) Planning for the State's socio-cultural advancement with regard to housing shall be directed toward the achievement of the following objectives:			
(1) Greater opportunities for Hawaii's people to secure reasonably priced, safe, sanitary, and livable homes, located in suitable environments that satisfactorily accommodate the needs and desires of families and individuals, through collaboration and cooperation between government and nonprofit and for-profit developers to ensure that more affordable housing is made available to very low-, low- and moderate-income segments of Hawaii's population.	X		
(2) The orderly development of residential areas sensitive to community needs and other land uses.	X		
(3) The development and provision of affordable rental housing by the State to meet the housing needs of Hawaii's people.	X		
(b) To achieve the housing objectives, it shall be the policy of this State to:			
(1) Effectively accommodate the housing needs of Hawaii's people.	X		
(2) Stimulate and promote feasible approaches that increase housing choices for low-income, moderate-income, and gap-group households.	X		
(3) Increase homeownership and rental opportunities and choices in terms of quality, location, cost, densities, style, and size of housing.	X		
(4) Promote appropriate improvement, rehabilitation, and maintenance of existing housing units and residential areas.			X

AR00027214

Hawaii State Plan, Chapter 226, Hawaii Revised Statutes – Part I. Overall Theme, Goals, Objectives and Policies	S	N/S	N/A
(5) Promote design and location of housing developments taking into account the physical setting, accessibility to public facilities and services, and other concerns of existing communities and surrounding areas.	X		
(6) Facilitate the use of available vacant, developable, and underutilized urban lands for housing.	X		
(7) Foster a variety of lifestyles traditional to Hawaii through the design and maintenance of neighborhoods that reflect the culture and values of the community.	X		
(8) Promote research and development of methods to reduce the cost of housing construction in Hawaii.			X
Discussion: The Ho'opili project will construct up to 11,750 residential units of varying housing product types. The Project will consist of for-sale single-family units and multi-family units, with multi-family rental units also available. In accordance with the City and County of Honolulu's affordable housing guidelines, up to 30 percent of the total number of units are expected to be developed as affordable housing units. Details of the affordable housing program in the Ho'opili project that pertain to the regulations and programs of the City and County of Honolulu will be coordinated with the County prior to development. The Ho'opili Conceptual Land Use Plan reflects the desire for a community that provides: affordable living options; employment centers; quality schools; shopping, gathering and recreational places; and parks and open space for residents. The proposed project is envisioned as a new kind of development, one that improves the quality of people's lives by allowing them to live, work, learn, shop and play in their own community.			
HRS § 226-20: Objectives and policies for socio-cultural advancement – health			
(a) Planning for the State's socio-cultural advancement with regard to health shall be directed towards achievement of the following objectives:			
(1) Fulfillment of basic individual health needs of the general public.			X
(2) Maintenance of sanitary and environmentally healthful conditions in Hawaii's communities.	X		
(b) To achieve the health objectives, it shall be the policy of this State to:			
(1) Provide adequate and accessible services and facilities for prevention and treatment of physical and mental health problems, including substance abuse.			X
(2) Encourage improved cooperation among public and private sectors in the provision of health care to accommodate the total health needs of individuals throughout the State.			X
(3) Encourage public and private efforts to develop and promote statewide and local strategies to reduce health care and related insurance costs.			X
(4) Foster an awareness of the need for personal health maintenance and preventive health care through education and other measures.			X
(5) Provide programs, services, and activities that ensure environmentally healthful and sanitary conditions.	X		
(6) Improve the State's capabilities in preventing contamination by pesticides and other potentially hazardous substances through increased coordination, education, monitoring, and enforcement.	X		
Discussion: The Ho'opili project will provide solid waste and wastewater services to ensure maintenance of public health standards. The Petitioner is coordinating with State DOH to develop			

Hawaii State Plan, Chapter 226, Hawaii Revised Statutes – Part I. Overall Theme, Goals, Objectives and Policies	S	N/S	N/A
a methodology for the testing of the soils of the Petition Area and the surrounding UHWO site to determine the presence or absence of dioxin in the underlying soils from previous sugar cultivation in the area.			
HRS § 226-21: Objectives and policies for socio-cultural advancement – education.			
(a) Planning for the State's socio-cultural advancement with regard to education shall be directed towards achievement of the objective of the provision of a variety of educational opportunities to enable individuals to fulfill their needs, responsibilities, and aspirations.			
(b) To achieve the education objectives, it shall be the policy of this State to:			
(1) Support educational programs and activities that enhance personal development, physical fitness, recreation, and cultural pursuits of all groups.			X
(2) Ensure the provision of adequate and accessible educational services and facilities that are designed to meet individual and community needs.	X		
(3) Provide appropriate educational opportunities for groups with special needs.	X		
(4) Promote educational programs which enhance understanding of Hawaii's cultural heritage.			X
(5) Provide higher educational opportunities that enable Hawaii's people to adapt to changing employment demands.			X
(6) Assist individuals, especially those experiencing critical employment problems or barriers, or undergoing employment transitions, by providing appropriate employment training programs and other related educational opportunities.			X
(7) Promote programs and activities that facilitate the acquisition of basic skills, such as reading, writing, computing, listening, speaking, and reasoning.	X		
(8) Emphasize quality educational programs in Hawaii's institutions to promote academic excellence.	X		
(9) Support research programs and activities that enhance the education programs of the State.			X
Discussion: The Ho'opili project could include as many as five public school sites, as well as parks, open space and facilities for walking and biking. Approximately 90 acres will be reserved for public schools and facilities to meet the demand for educational facilities in the growing 'Ewa region. In addition, there is a possibility that one or two private schools may be included in the project.			
HRS § 226-22: Objective and policies for socio-cultural advancement – social services			
(a) Planning for the State's socio-cultural advancement with regard to social services shall be directed towards the achievement of the objective of improved public and private social services and activities that enable individuals, families, and groups to become more self-reliant and confident to improve their well-being.			
(b) To achieve the social service objective, it shall be the policy of the State to:			
(1) Assist individuals, especially those in need of attaining a minimally adequate standard of living and those confronted by social and economic hardship conditions, through social services and activities within the State's fiscal capacities.			X
(2) Promote coordination and integrative approaches among public	X		

AR00027216

Hawaii State Plan, Chapter 226, Hawaii Revised Statutes – Part I. Overall Theme, Goals, Objectives and Policies	S	N/S	N/A
and private agencies and programs to jointly address social problems that will enable individuals, families, and groups to deal effectively with social problems and to enhance their participation in society.			
(3) Facilitate the adjustment of new residents, especially recently arrived immigrants, into Hawaii's communities.			X
(4) Promote alternatives to institutional care in the provision of long-term care for elder and disabled populations.			X
(5) Support public and private efforts to prevent domestic abuse and child molestation, and assist victims of abuse and neglect.			X
(6) Promote programs which assist people in need of family planning services to enable them to meet their needs.			X
Discussion: While the State's policies related to social services are not directly applicable to the Ho'opili project, the Petitioner supports the State's objectives. Pursuant to the City and County of Honolulu's affordable housing requirement, thirty percent of the project's residential units will be affordable.			
HRS § 226-23: Objectives and policies for socio-cultural advancement – leisure.			
(a) Planning for the State's socio-cultural advancement with regard to leisure shall be directed towards the achievement of the objective of the adequate provision of resources to accommodate diverse cultural, artistic, and recreational needs for present and future generations.			
(b) To achieve the leisure objectives, it shall be the policy of this State to:			
(1) Foster and preserve Hawaii's multi-cultural heritage through supportive cultural, artistic, recreational, and humanities-oriented programs and activities.			X
(2) Provide a wide range of activities and facilities to fulfill the cultural, artistic, and recreational needs of all diverse and special groups effectively and efficiently.			X
(3) Enhance the enjoyment of recreational experiences through safety and security measures, educational opportunities, and improved facility design and maintenance.			X
(4) Promote the recreational and educational potential of natural resources having scenic, open space, cultural, historical, geological, or biological values while ensuring that their inherent values are preserved.	X		
(5) Ensure opportunities for everyone to use and enjoy Hawaii's recreational resources.	X		
(6) Assure the availability of sufficient resources to provide for future cultural, artistic, and recreational needs.	X		
(7) Provide adequate and accessible physical fitness programs to promote the physical and mental well-being of Hawaii's people.	X		
(8) Increase opportunities for appreciation and participation in the creative arts, including the literary, theatrical, visual, musical, folk, and traditional art forms.			X
(9) Encourage the development of creative expression in the artistic disciplines to enable all segments of Hawaii's population to participate in the creative arts.			X
(10)Assure adequate access to significant natural and cultural resources in public ownership.	X		

AR00027217

Hawaii State Plan, Chapter 226, Hawaii Revised Statutes – Part I. Overall Theme, Goals, Objectives and Policies	S	N/S	N/A
Discussion: The Petitioner will comply with the City and County of Honolulu's Park Dedication Ordinance. The Ho'opili project includes approximately 210 acres for park and open space. The Petitioner proposes a series of parks and open spaces including a district park with active playfields, proposed to be located within the center of the Ho'opili project. In addition, a Canyon Park, located at the southeastern portion of the Ho'opili project, can provide a unique wilderness-type park alternative for residents. A Civic Plaza is envisioned as a community gathering space for outdoor concerts, farmer's markets, and other community events. Interspersed throughout the project will be "mini" (neighborhood) parks. The project is envisioned to integrate an extensive network of open space and walking/biking paths.			
HRS § 226-24: Objective and policies for socio-cultural advancement – individual rights and personal well-being.			
(a) Planning for the State's socio-cultural advancement with regard to individual rights and personal well-being shall be directed towards achievement of the objective of increased opportunities and protection of individual rights to enable individuals to fulfill their socio-economic needs and aspirations.			
(b) To achieve the individual rights and personal well-being objective, it shall be the policy of this State to:			
(1) Provide effective services and activities that protect individuals from criminal acts and unfair practices and that alleviate the consequences of criminal acts in order to foster a safe and secure environment.			X
(2) Uphold and protect the national and state constitutional rights of every individual.			X
(3) Assure access to, and availability of, legal assistance, consumer protection, and other public services which strive to attain social justice.			X
(4) Ensure equal opportunities for individual participation in society.			X
Discussion: While the State's policies related to an individual's rights and personal well-being are not directly applicable to the Ho'opili project, the Petitioner supports the State's objectives.			
HRS § 226-25: Objectives and policies for socio-cultural advancement – culture.			
(a) Planning for the State's socio-cultural advancement with regard to culture shall be directed toward the achievement of the objective of enhancement of cultural identities, traditions, values, customs, and arts of Hawaii's people.			
(b) To achieve the culture objective, it shall be the policy of this State to:			
(1) Foster increased knowledge and understanding of Hawaii's ethnic and cultural heritages and the history of Hawaii.			X
(2) Support activities and conditions that promote cultural values, customs, and arts that enrich the lifestyles of Hawaii's people and which are sensitive and responsive to family and community needs.			X
(3) Encourage increased awareness of the effects of proposed public and private actions on the integrity and quality of cultural and community lifestyles in Hawaii.			X
(4) Encourage the essence of the aloha spirit in people's daily activities to promote harmonious relationships among Hawaii's people and visitors.			X
Discussion: While the State's policies related to culture are not directly applicable to the Ho'opili			

AR00027218

Hawaii State Plan, Chapter 226, Hawaii Revised Statutes – Part I. Overall Theme, Goals, Objectives and Policies	S	N/S	N/A
project, the Petitioner supports the State's objectives. The project is not anticipated to have an adverse impact of Hawaiian culture, practices, and traditions, and may include some area within the Canyon Park for Hawaiian cultural practices such as the practice of hula.			
HRS § 226-26: Objectives and policies for socio-cultural advancement – public safety.			
(a) Planning for the State's socio-cultural advancement with regard to public safety shall be directed towards the achievement of the following objectives:			
(1) Assurance of public safety and adequate protection of life and property for all people.			X
(2) Optimum organizational readiness and capability in all phases of emergency management to maintain the strength, resources, and social and economic well-being of the community in the event of civil disruptions, wars, natural disasters, and other major disturbances.			X
(3) Promotion of a sense of community responsibility for the welfare and safety of Hawaii's people.			X
(b) To achieve the public safety objectives, it shall be the policy of this State to:			
(1) Ensure that public safety programs are effective and responsive to community needs.			X
(2) Encourage increased community awareness and participation in public safety programs.			X
(c) To further achieve public safety objectives related to criminal justice, it shall be the policy of this State to:			
(1) Support criminal justice programs aimed at preventing and curtailing criminal activities.			X
(2) Develop a coordinated, systematic approach to criminal justice administration among all criminal justice agencies.			X
(3) Provide a range of correctional resources which may include facilities and alternatives to traditional incarceration in order to address the varied security needs of the community and successfully reintegrate offenders into the community.			X
(d) To further achieve public safety objectives related to emergency management, it shall be the policy of this State to:			
(1) Ensure that responsible organizations are in a proper state of readiness to respond to major war-related, natural, or technological disasters and civil disturbances at all times.			X
(2) Enhance the coordination between emergency management programs throughout the State.			X
Discussion: While the State's policies related to culture are not directly applicable to the Ho'opili project, the Petitioner supports the State's objectives. The proposed project is located within Honolulu Police Department (HPD) District 8, which encompasses the leeward coast and the 'Ewa Plain. In order to meet the growing needs of the 'Ewa Plain communities, in 2000, the City and County of Honolulu opened the Regional Kapolei Police Station at 1100 Kamokila Boulevard. Fire protection in the *Ewa Development Plan Area* is provided by the Honolulu Fire Department (HFD) 'Ewa Beach Fire Station (an engine company), Makakilo Fire Station (an engine company), and Kapolei Fire Station (an engine and ladder company, and the Battalion 4 Headquarters). The Kapolei Fire Station located in Kapolei Business Park was completed in 1995 to serve the			

AR00027219

Hawaii State Plan, Chapter 226, Hawaii Revised Statutes – Part I. Overall Theme, Goals, Objectives and Policies	S	N/S	N/A
expanding development on the 'Ewa Plain. According to the *Ewa Development Plan*, to meet the projected population and economic growth in 'Ewa by 2020, three fire stations at 'Ewa Villages, Ko 'Olina, and Makaiwa Hills are planned; however, service dates have yet to been determined.			
HRS § 226-27: Objectives and policies for socio-cultural advancement – government.			
(a) Planning the State's socio-cultural advancement with regard to government shall be directed towards the achievement of the following objectives:			
(1) Efficient, effective, and responsive government services at all levels in the State.			X
(2) Fiscal integrity, responsibility, and efficiency in the state government and county governments.			X
(b) To achieve the government objectives, it shall be the policy of this State to:			
(1) Provide for necessary public goods and services not assumed by the private sector.			X
(2) Pursue an openness and responsiveness in government that permits the flow of public information, interaction, and response.			X
(3) Minimize the size of government to that necessary to be effective.			X
(4) Stimulate the responsibility in citizens to productively participate in government for a better Hawaii.			X
(5) Assure that government attitudes, actions, and services are sensitive to community needs and concerns.			X
(6) Provide for a balanced fiscal budget.			X
(7) Improve the fiscal budgeting and management system of the State.			X
(8) Promote the consolidation of state and county governmental functions to increase the effective and efficient delivery of government programs and services and to eliminate duplicative services wherever feasible.			X
Discussion: While the State's policies related to government are not directly applicable to the Ho'opili project, the Petitioner supports the State's objectives.			

AR00027220

Table 5.5. Hawaii State Plan, Chapter 226, Hawaii Revised Statutes – Part III. Priority Guidelines

Hawaii State Plan, Chapter 226, Hawaii Revised Statutes – Part III. Priority Guidelines	S	N/S	N/A
HRS § 226-101: Purpose. The purpose of this part is to establish overall priority guidelines to address areas of statewide concern.			
HRS § 226-102: Overall direction. The State shall strive to improve the quality of life for Hawaii's present and future population through the pursuit of desirable courses of action in five major areas of statewide concern which merit priority attention: economic development, population growth and land resource management, affordable housing, crime and criminal justice, and quality education.			
HRS § 226-103: Economic priority guidelines.			
(a) Priority guidelines to stimulate economic growth and encourage business expansion and development to provide needed jobs for Hawaii's people and achieve a stable and diversified economy:			
(1) Seek a variety of means to increase the availability of investment capital for new and expanding enterprises.			
(A) Encourage investments which:			
(i) Reflect long term commitments to the State;			X
(ii) Rely on economic linkages within the local economy;			X
(iii) Diversify the economy;			X
(iv) Reinvest in the local economy;			X
(v) Are sensitive to community needs and priorities; and	X		
(vi) Demonstrate a commitment to provide management opportunities to Hawaii residents.			X
(2) Encourage the expansion of technological research to assist industry development and support the development and commercialization of technological advancements.			X
(3) Improve the quality, accessibility, and range of services provided by government to business, including data and reference services and assistance in complying with governmental regulations.			X
(4) Seek to ensure that state business tax and labor laws and administrative policies are equitable, rational, and predictable.			X
(5) Streamline the building and development permit and review process, and eliminate or consolidate other burdensome or duplicative governmental requirements imposed on business, where public health, safety and welfare would not be adversely affected.			X
(6) Encourage the formation of cooperatives and other favorable marketing or distribution arrangements at the regional or local level to assist Hawaii's small-scale producers, manufacturers, and distributors.			X
(7) Continue to seek legislation to protect Hawaii from transportation interruptions between Hawaii and the continental United States.			X
(8) Provide public incentives and encourage private initiative to develop and attract industries which promise long-term growth potentials and which have the following characteristics:			X
(A) An industry that can take advantage of Hawaii's unique location and available physical and human resources.			X

AR00027221

Hawaii State Plan, Chapter 226, Hawaii Revised Statutes – Part III. Priority Guidelines	S	N/S	N/A
(B) A clean industry that would have minimal adverse effects on Hawaii's environment.			X
(C) An industry that is willing to hire and train Hawaii's people to meet the industry's labor needs at all levels of employment.			X
(D) An industry that would provide reasonable income and steady employment.			X
(9) Support and encourage, through educational and technical assistance programs and other means, expanded opportunities for employee ownership and participation in Hawaii business.			X
(10)Enhance the quality of Hawaii's labor force and develop and maintain career opportunities for Hawaii's people through the following actions:			X
(A) Expand vocational training in diversified agriculture, aquaculture, information industry, and other areas where growth is desired and feasible.			X
(B) Encourage more effective career counseling and guidance in high schools and post-secondary institutions to inform students of present and future career opportunities.			X
(C) Allocate educational resources to career areas where high employment is expected and where growth of new industries is desired.			X
(D) Promote career opportunities in all industries for Hawaii's people by encouraging firms doing business in the State to hire residents.			X
(E) Promote greater public and private sector cooperation in determining industrial training needs and in developing relevant curricula and on- the-job training opportunities.			X
(F) Provide retraining programs and other support services to assist entry of displaced workers into alternative employment.			X
Discussion: While the State's policies related to are broader than the Ho'opili project, the Petitioner supports the State's objectives, and envisions that the proposed project along with UHWO and DHHL East Kapolei will enhance Kapolei as the "Second City" on O'ahu, and relieve the development pressure caused by Central Business District, on traffic, office rents, et cetera.			
(b) Priority guidelines to promote the economic health and quality of the visitor industry:			
(1) Promote visitor satisfaction by fostering an environment which enhances the Aloha Spirit and minimizes inconveniences to Hawaii's residents and visitors.			X
(2) Encourage the development and maintenance of well-designed, adequately serviced hotels and resort destination areas which are sensitive to neighboring communities and activities and which provide for adequate shoreline setbacks and beach access.			X
(3) Support appropriate capital improvements to enhance the quality of existing resort destination areas and provide incentives to encourage investment in upgrading, repair, and maintenance of visitor facilities.			X
(4) Encourage visitor industry practices and activities which respect, preserve, and enhance Hawaii's significant natural, scenic, historic, and cultural resources.			X
(5) Develop and maintain career opportunities in the visitor industry for Hawaii's people, with emphasis on managerial positions.			X

Hawaii State Plan, Chapter 226, Hawaii Revised Statutes – Part III. Priority Guidelines	S	N/S	N/A
(6) Support and coordinate tourism promotion abroad to enhance Hawaii's share of existing and potential visitor markets.			X
(7) Maintain and encourage a more favorable resort investment climate consistent with the objectives of this chapter.			X
(8) Support law enforcement activities that provide a safer environment for both visitors and residents alike.			X
(9) Coordinate visitor industry activities and promotions to business visitors through the state network of advanced data communication techniques.			X
Discussion: While the State's policies related to the visitor industry are not directly applicable to the Ho'opili project, the Petitioner supports the State's objectives.			
(c) Priority guidelines to promote the continued viability of the sugar and pineapple industries:			
(1) Provide adequate agricultural lands to support the economic viability of the sugar and pineapple industries.			X
(2) Continue efforts to maintain federal support to provide stable sugar prices high enough to allow profitable operations in Hawaii.			X
(3) Support research and development, as appropriate, to improve the quality and production of sugar and pineapple crops.			X
Discussion: The above guidelines are predominantly not applicable to the Ho'opili project. These policies were developed prior to the contraction of the sugarcane and pineapple industries, and as such, in the post "plantation" era, there is an abundant supply of land available for the sugar and pineapple industries, however, their viability is dependent on many factors, such as cheaper cost of production overseas.			
(d) Priority guidelines to promote the growth and development of diversified agriculture and aquaculture:			
(1) Identify, conserve, and protect agricultural and aquacultural lands of importance and initiate affirmative and comprehensive programs to promote economically productive agricultural and aquacultural uses of such lands.			X
(2) Assist in providing adequate, reasonably priced water for agricultural activities.			X
(3) Encourage public and private investment to increase water supply and to improve transmission, storage, and irrigation facilities in support of diversified agriculture and aquaculture.			X
(4) Assist in the formation and operation of production and marketing associations and cooperatives to reduce production and marketing costs.			X
(5) Encourage and assist with the development of a waterborne and airborne freight and cargo system capable of meeting the needs of Hawaii's agricultural community.			X
(6) Seek favorable freight rates for Hawaii's agricultural products from interisland and overseas transportation operators.			X
(7) Encourage the development and expansion of agricultural and aquacultural activities which offer long-term economic growth potential and employment opportunities.			X
(8) Continue the development of agricultural parks and other programs to assist small independent farmers in securing agricultural lands and loans.			X
(9) Require agricultural uses in agricultural subdivisions and closely monitor the uses in these subdivisions.			X

Hawaii State Plan, Chapter 226, Hawaii Revised Statutes – Part III. Priority Guidelines	S	N/S	N/A
(10) Support the continuation of land currently in use for diversified agriculture.			X
Discussion: The agricultural policies are predominantly not applicable to the Ho'opili project. These policies were developed prior to the contraction of the sugarcane and pineapple industries, and as such, in the post "plantation" era, there is an abundant supply of land available for diversified agriculture. The Ho'opili project lies within the State Agricultural District (See Figure 2.4: State Land Use District). As such, a State Land Use District Boundary Amendment will be sought to change the site from the Agricultural District to the Urban District. The proposed State Land Use District Boundary Amendment is consistent with the standards for determining boundaries of the Urban District as the majority of adjacent lands that surround the Petition Area are within the Urban District. The Petition Area lies within the City and County of Honolulu's Ewa DP Urban Growth Boundary, and as such, reclassification of the Petition Area to the Urban District and subsequent City and County of Honolulu Change of Zone application would permit the Petition Area to conform to the surrounding land uses and would permit the low- to medium-density residential uses.			
(e) Priority guidelines for water use and development:			
(1) Maintain and improve water conservation programs to reduce the overall water consumption rate.	X		
(2) Encourage the improvement of irrigation technology and promote the use of nonpotable water for agricultural and landscaping purposes.			X
(3) Increase the support for research and development of economically feasible alternative water sources.			X
(4) Explore alternative funding sources and approaches to support future water development programs and water system improvements.	X		
Discussion: The project will be maximizing the use of non-potable water (both from brackish water sources, as well as reclaimed water) for irrigation to minimize the impact on the source component of the BWS system. It is proposed that the project's greenbelts, parks and roadway medians use non-potable water for irrigation, if a suitable supply will be available. The BWS Water Resources Division will be contacted regarding the availability of recycled water and other non-potable water supplies. Low-flow water fixtures and where possible, other water conservation measures will be designed and implemented as part of the proposed development.			
(f) Priority guidelines for energy use and development:			
(1) Encourage the development, demonstration, and commercialization of renewable energy sources.	X		
(2) Initiate, maintain, and improve energy conservation programs aimed at reducing energy waste and increasing public awareness of the need to conserve energy.	X		
(3) Provide incentives to encourage the use of energy conserving technology in residential, industrial, and other buildings.	X		
(4) Encourage the development and use of energy conserving and cost-efficient transportation systems.	X		
Discussion: Based on DBEDT Strategic Industries Division's recommendations, the Petitioner's mechanical and electrical consultants, in consultation with its sustainability consultant, will be directed to review the City and County of Honolulu's Energy Code early in the project and to consult with Hawaiian Electric Company, Inc. (HECO) on demand-side management programs that offer rebates for installation of energy-efficient technologies (including solar power and energy-			

AR00027224

Hawaii State Plan, Chapter 226, Hawaii Revised Statutes – Part III. Priority Guidelines	S	N/S	N/A
efficient appliances). The Petitioner is also considering, where practicable, the potential of another source of electrical power. Currently there are businesses that will install photovoltaic panels on the roofs of buildings at no initial cost in return for set rates for electricity.			
(g) Priority guidelines to promote the development of the information industry:			
(1) Establish an information network that will serve as the catalyst for establishing a viable information industry in Hawaii.			X
(2) Encourage the development of services such as financial data processing, a products and services exchange, foreign language translations, telemarketing, teleconferencing, a twenty-four-hour international stock exchange, international banking, and a Pacific Rim management center.			X
(3) Encourage the development of small businesses in the information field such as software development, the development of new information systems and peripherals, data conversion and data entry services, and home or cottage services such as computer programming, secretarial, and accounting services.			X
(4) Encourage the development or expansion of educational and training opportunities for residents in the information and telecommunications fields.			X
(5) Encourage research activities, including legal research in the information and telecommunications fields.			X
(6) Support promotional activities to market Hawaii's information industry services.			X
Discussion: While the State's policies related to the information industry are broader than the Ho'opili project, the Petitioner supports the State's objectives, and would welcome the opportunity to work with both UHWO and area high schools to attract such businesses, train students and provide jobs to high school and UHWO graduates.			
HRS § 226-104: Population growth and land resources priority guidelines.			
(a) Priority guidelines to effect desired statewide growth and distribution:			
(1) Encourage planning and resource management to insure that population growth rates throughout the State are consistent with available and planned resource capacities and reflect the needs and desires of Hawaii's people.	X		
(2) Manage a growth rate for Hawaii's economy that will parallel future employment needs for Hawaii's people.			X
(3) Ensure that adequate support services and facilities are provided to accommodate the desired distribution of future growth throughout the State.	X		
(4) Encourage major state and federal investments and services to promote economic development and private investment to the neighbor islands, as appropriate.			X
(5) Explore the possibility of making available urban land, low-interest loans, and housing subsidies to encourage the provision of housing to support selective economic and population growth on the neighbor islands.			X
(6) Seek federal funds and other funding sources outside the State for research, program development, and training to provide future			X

AR00027225

Hawaii State Plan, Chapter 226, Hawaii Revised Statutes – Part III. Priority Guidelines	S	N/S	N/A
employment opportunities on the neighbor islands.			
(7) Support the development of high technology parks on the neighbor islands.			X
(b) Priority guidelines for regional growth distribution and land resource utilization:			
(1) Encourage urban growth primarily to existing urban areas where adequate public facilities are already available or can be provided with reasonable public expenditures, and away from areas where other important benefits are present, such as protection of important agricultural land/or preservation of lifestyles.	X		
(2) Make available marginal or nonessential agricultural lands for appropriate urban uses while maintaining agricultural lands of importance in the agricultural district.		X	
(3) Restrict development when drafting of water would result in exceeding the sustainable yield or in significantly diminishing the recharge capacity of any groundwater area.			X
(4) Encourage restriction of new urban development in areas where water is insufficient from any source for both agricultural and domestic use.			X
(5) In order to preserve green belts, give priority to state capital-improvement funds which encourage location of urban development within existing urban areas except where compelling public interest dictates development of a noncontiguous new urban core.	X		
(6) Seek participation from the private sector for the cost of building infrastructure and utilities, and maintaining open spaces.	X		
(7) Pursue rehabilitation of appropriate urban areas.			X
(8) Support the redevelopment of Kakaako into a viable residential, industrial, and commercial community.			X
(9) Direct future urban development away from critical environmental areas or impose mitigating measures so that negative impacts on the environment would be minimized.	X		
(10) Identify critical environmental areas in Hawaii to include but not be limited to the following: watershed and recharge areas; wildlife habitats (on land and in the ocean); areas with endangered species of plants and wildlife; natural streams and water bodies; scenic and recreational shoreline resources; open space and natural areas; historic and cultural sites; areas particularly sensitive to reduction in water and air quality; and scenic resources.	X		
(11) Identify all areas where priority should be given to preserving rural character and lifestyle.			X
(12) Utilize Hawaii's limited land resources wisely, providing adequate land to accommodate projected population and economic growth needs while ensuring the protection of the environment and the availability of the shoreline, conservation lands, and other limited resources for future generations.	X		
(13) Protect and enhance Hawaii's shoreline, open spaces, and scenic resources.	X		
Discussion: The Petition Area is currently in the State Agricultural District (See Figure 2.4: State Land Use District). The proposed State Land Use District Boundary Amendment is consistent with the standards for determining boundaries of the Urban District pursuant to Section 15-15-18, HAR.			

Hawaii State Plan, Chapter 226, Hawaii Revised Statutes – Part III. Priority Guidelines	S	N/S	N/A
The majority of adjacent lands that surround the Petition Area are within the Urban District. Existing residential developments include: Waipahu Town to the northeast; Honouliuli and West Loch Estates to the east; and 'Ewa Villages and 'Ewa Villages Golf Course to the south. Vacant lands to the west are slated for future development by UHWO and DHHL. The lands to north of the Petition Area are within the Agricultural State Land Use District, but fall outside of the City and County of Honolulu's Ewa DP Urban Growth Boundary. As previously state, the Petition Area lies within the City and County of Honolulu's Ewa DP Urban Growth Boundary, and as such, reclassification of the Petition Area to the Urban District and subsequent City and County of Honolulu Change of Zone application would permit the Petition Area to conform to the surrounding land uses and would permit the low-to medium-density residential uses and recreational development. According to the City and County of Honolulu Department of Planning and Permitting (DPP), the year 2006 population of the *Ewa Development Plan Area* (DPA) was 86,000 (DPP, 2006). This comprised an increase of 25.1 percent from its 2000 population of 68,718. The DPP expects the population of the Ewa DPA to increase to 180,200 by the year 2030. In comparison, the population for the City and County of Honolulu as a whole increased only 3.8 percent from 876,156 to 909,863 between 2000 and 2006. The City and County of Honolulu is expected to experience a population growth of 27.5 percent (241,144 persons) from 876,156 to 1,117,300 total residents during the same 30-year period. Besides providing substantial housing opportunities for the 'Ewa region, the Ho'opili project also supports the State's population distribution policies. This EIS identifies existing natural and physical site conditions (i.e., slope, soils, drainage characteristics, archaeological sites, flora and fauna, public services and infrastructure) and potential impacts resulting from the Ho'opili project, and proposes several measures to mitigate potential impacts.			
HRS § 226-105: Crime and criminal justice. Priority guidelines in the area of crime and criminal justice:			
(1) Support law enforcement activities and other criminal justice efforts that are directed to provide a safer environment.			**X**
(2) Target state and local resources on efforts to reduce the incidence of violent crime and on programs relating to the apprehension and prosecution of repeat offenders.			**X**
(3) Support community and neighborhood program initiatives that enable residents to assist law enforcement agencies in preventing criminal activities.			**X**
(4) Reduce overcrowding or substandard conditions in correctional facilities through a comprehensive approach among all criminal justice agencies which may include sentencing law revisions and use of alternative sanctions other than incarceration for persons who pose no danger to their community.			**X**
(5) Provide a range of appropriate sanctions for juvenile offenders, including community-based programs and other alternative sanctions.			**X**
(6) Increase public and private efforts to assist witnesses and victims of crimes and to minimize the costs of victimization.			**X**
Discussion: While the State's policies related to crime and criminal justice are more under the purview of either law enforcement agencies or private neighborhood watch-type programs, the Petitioner supports the State's objectives.			

AR00027227

Hawaii State Plan, Chapter 226, Hawaii Revised Statutes – Part III. Priority Guidelines	S	N/S	N/A
HRS § 226-106: Affordable housing. Priority guidelines for the provision of affordable housing:			
(1) Seek to use marginal or nonessential agricultural land and public land to meet housing needs of low- and moderate-income and gap-group households.			X
(2) Encourage the use of alternative construction and development methods as a means of reducing production costs.			X
(3) Improve information and analysis relative to land availability and suitability for housing.			X
(4) Create incentives for development which would increase home ownership and rental opportunities for Hawaii's low- and moderate-income households, gap-group households, and residents with special needs.	X		
(5) Encourage continued support for government or private housing programs that provide low interest mortgages to Hawaii's people for the purchase of initial owner- occupied housing.			X
(6) Encourage public and private sector cooperation in the development of rental housing alternatives.	X		
(7) Encourage improved coordination between various agencies and levels of government to deal with housing policies and regulations.	X		
(8) Give higher priority to the provision of quality housing that is affordable for Hawaii's residents and less priority to development of housing intended primarily for individuals outside of Hawaii.	X		
Discussion: While the Ho'opili project does not create incentives to encourage affordable housing, it does plan to implement the City and County of Honolulu's existing affordable housing requirements in the construction of affordable housing units. As such, up to 30 percent of the total number of units are expected to be developed as affordable housing units. Details of the affordable housing program in the Ho'opili project that pertain to the regulations and programs of the City and County of Honolulu will be coordinated with the County prior to development.			
HRS § 226-107: Quality education. Priority guidelines to promote quality education:			
(1) Pursue effective programs which reflect the varied district, school, and student needs to strengthen basic skills achievement;			X
(2) Continue emphasis on general education "core" requirements to provide common background to students and essential support to other university programs;			X
(3) Initiate efforts to improve the quality of education by improving the capabilities of the education work force;			X
(4) Promote increased opportunities for greater autonomy and flexibility of educational institutions in their decision-making responsibilities;			X
(5) Increase and improve the use of information technology in education by the availability of telecommunications equipment for:			X
(A) The electronic exchange of information;			X
(B) Statewide electronic mail; and			X
(C) Access to the Internet.			X
Encourage programs that increase the public's awareness and understanding of the impact of information technologies on our lives;			X

AR00027228

Hawaii State Plan, Chapter 226, Hawaii Revised Statutes – Part III. Priority Guidelines	S	N/S	N/A
(6) Pursue the establishment of Hawaii's public and private universities and colleges as research and training centers of the Pacific;			X
(7) Develop resources and programs for early childhood education;			X
(8) Explore alternatives for funding and delivery of educational services to improve the overall quality of education; and			X
(9) Strengthen and expand educational programs and services for students with special needs.			X
Discussion: While the State's policies related to quality education are directed more towards public and private educational providers, the Petitioner supports the State's objectives, especially regarding the development of UHWO and setting aside land for public schools.			

AR00027229

5.2.6 Hawaii State Functional Plans

The *Hawaii State Plan* is primarily guided by the *State Functional Plans* (Chapter 226, HRS) and implemented by the Department of Budget and Finance and the State LUC. *State Functional Plans* are prepared by various state agencies to serve as the primary implementing vehicle for the goals, objectives, and policies of the *Hawaii State Plan*. A brief description on how the proposed project complies with the *State Functional Plans* is listed in the table below.

Table 5.6. Hawaii State Functional Plans

Hawaii State Functional Plans		S	N/S	N/A
AGRICULTURE FUNCTIONAL PLAN				
Objective A:	Achievement of increased agricultural production and growth through cultural and management practices.		X	
Objective B:	Achievement of an orderly agricultural marketing system through product promotion and industry organization.		X	
Objective C:	Achievement of increased consumption of and demand for Hawaii's agricultural products through consumer education and product quality.		X	
Objective D:	Achievement of optimal contribution by agriculture to the State's economy.		X	
Objective E:	Achievement of adequate capital, and knowledge of its proper management, for agricultural development.		X	
Objective F:	Achievement of increased agricultural production and growth through pest and disease controls.		X	
Objective G:	Achievement of effective protection and improved quality of Hawaii's land, water, and air.		X	
Objective H:	Achievement of productive agricultural use of lands most suitable and needed for agriculture.		X	
Objective I:	Achievement of efficient and equitable provision of adequate water for agricultural use.		X	
Objective J:	Achievement of maximum degree of public understanding and support of agriculture in Hawaii.		X	
Objective K:	Achievement of adequate supply of properly trained labor for agricultural needs.		X	
Objective L:	Achievement of adequate transportation services and facilities to meet agricultural needs.		X	
Objective M:	Achievement of adequate support services and infrastructure to meet agricultural needs.		X	
Discussion: The Ho'opili project is currently within the State Agricultural District (See Figure 2.4: State Land Use District). However, the *Ewa Development Plan* designates the Petition Area as Low and Medium Density Residential, High Density Residential, Agricultural Land Preservation, Parks, and Transit Node (High Density Residential and Commercial) and Future Intermediate School (See Figure 2.5: Ewa Development Plan). Currently, the Petitioner is in the process of filing a petition with the State Land Use Commission to reclassify the Petition Area to the Urban District. The petition for reclassification is consistent with the standards for determining boundaries of the Urban District pursuant to Section 15-15-18, HAR.				

AR00027230

Hawaii State Functional Plans		S	N/S	N/A
The project is intended to be developed through 2030, and as such, the Petitioner will only withdraw land from the leases on an as needed basis for construction and development and as provided for in agreements with the individual lessees. Within the Petition Area, lands will gradually be withdrawn from agricultural production for residential, commercial, and educational uses.				
CONSERVATION LANDS FUNCTIONAL PLAN				
Objective IA:	Establishment of data bases for inventories of existing lands and resources.			X
Objective IB:	Establishment of criteria for management of land and natural resources.			X
Objective IIA:	Establishment of plans for natural resources and land management.			X
Objective IIB:	Protection of fragile or rare natural resources.			X
Objective IIC:	Enhancement of natural resources.			X
Objective IID:	Appropriate development of natural resources.			X
Objective IIE:	Promotion and marketing of appropriate natural resources designated for commercial development.			X
Objective IIF:	Increase enforcement of land and natural resource use laws and regulations.			X
Objective IIIA:	Develop and implement conservation education programs for the general public and visitors.			X
Objective IIIB:	Increase access to land and natural resource data by the public and increase cooperation between agencies by making access to land and natural resource information more efficient.			X
Discussion: The objectives and policies in this plan do not apply to the Ho'opili project, since the property is not located within the State Conservation District (See Figure 2.4: State Land Use District).				
EDUCATION FUNCTIONAL PLAN				
Objective A(1):	**Academic Excellence.** Emphasize quality educational programs in Hawaii's institutions to promote academic excellence.	X		
Objective A(2):	**Basic Skills.** Promote programs and activities that facilitate the acquisition of basic skills, such as reading, writing, computing, listening, speaking, and reasoning. Pursue effective programs which reflect the varied district, school, and student needs to strengthen basic skills achievement.			X
Objective A(3):	**Education Workforce.** Initiate efforts to improve the quality of education by improving the capabilities of the education workforce.	X		
Objective A(4):	**Services and Facilities.** Ensure the provision of adequate and accessible educational services and facilities that are designed to meet individual and community needs.	X		
Objective B(1):	**Alternatives for Funding and Delivery.** Explore alternatives for funding and delivery of educational services to improve the overall quality of education.			X
Objective B(2):	**Autonomy and flexibility.** Promote increased opportunities for greater autonomy and flexibility of educational institutions in their decision-making responsibilities.			X
Objective B(3):	**Increased Use of Technology.** Increase and improve the use information technology in education and encourage programs			X

AR00027231

Hawaii State Functional Plans		S	N/S	N/A
	which increase the public's awareness and understanding of the impact of information technologies on our lives.			
Objective B(4):	**Personal Development.** Support education programs and activities that enhance personal development, physical fitness, recreation, and cultural pursuits of all groups.	X		
Objective B(5):	**Students with Special Needs.** Provide appropriate educational opportunities for groups with special needs.	X		
Objective C(1):	**Early Childhood Education.** Develop resources and programs for early childhood education.			X
Objective C(2):	**Hawaii's Cultural Heritage.** Promote educational programs which enhance understanding of Hawaii's cultural heritage.			X
Objective C(3):	**Research Programs and [Communication] Activities.** Support research programs and activities that enhance the education programs of the State.			X
Discussion: The Ho'opili project will provide as many as five public school sites (including elementary, middle and high school sites). Approximately 90 acres will be reserved for public schools and facilities to meet the demand for educational facilities in the growing 'Ewa region. In addition, there is a possibility that one or two private schools may be included in the project. Approximately seven acres have been set aside on the conceptual land use plan for one private school.				
EMPLOYMENT FUNCTIONAL PLAN				
Objective A:	Improve the qualifications of entry-level workers and their transition to employment.			X
Objective B:	Develop and deliver education, training and related services to ensure and maintain a quality and competitive workforce.	X		
Objective C:	Improve labor exchange.			X
Objective D:	Improve the quality of life for workers and families.	X		
Objective E:	Improve planning of economic development, employment and training activities	X		
Discussion: The Ho'opili project will provide for a diverse range of direct and indirect employment and economic opportunities for Hawai'i residents, both during and after project construction. Short-term construction-related jobs as well as permanent long-term operational jobs will be offered, increasing employment throughout the 'Ewa region and State. With greater employment and economic opportunities, the overall living standards and lifestyles will be enhanced for area residents, who will be able to live, work, learn, play, and shop within the Second City. For entry-level workers, availability of workforce housing and affordable transportation are key factors in achieving a desired lifestyle. The Ho'opili project is designed to be transit-ready, with higher-density housing, and employment and shopping opportunities proposed around the transit station(s). The entire project is mixed-use with live-work housing, allowing residents to rely less on automobile ownership costs and long commutes to achieve a desired lifestyle.				
ENERGY FUNCTIONAL PLAN				
Objective A:	Moderate the growth in energy demand through conservation and energy efficiency.	X		
Objective B:	Displace oil and fossil fuels through alternate and renewable energy resources.			X
Objective C:	Promote energy education and legislation.			X
Objective D:	Support and develop an integrated approach to energy development and management.			X
Objective E:	Ensure State's abilities to implement energy emergency actions			X

AR00027232

Hawaii State Functional Plans		S	N/S	N/A
	immediately in event of fuel supply disruptions. Ensure essential public services are maintained and provisions are made to alleviate economic and personal hardships which may arise.			
Discussion: The Ho'opili project will provide various housing and employment opportunities for the rapidly growing 'Ewa region, which will in turn, reduce the number of energy-consuming commuter trips other areas of O'ahu, particularly downtown Honolulu. Where feasible, project buildings, activities, and site grounds are intended to be designed with energy-saving considerations. Given the natural climate, the project may be suited for the use of renewable energy technologies including photovoltaics.				
HEALTH FUNCTIONAL PLAN				
Objective 1:	Health promotion and disease prevention. Reduction in the incidence, morbidity and mortality associated with preventable and controllable conditions.			**X**
Objective 2:	Prevention and control of communicable diseases. Reduction in the incidence, morbidity, and mortality associated with infectious and communicable diseases.			**X**
Objective 3:	Health needs of special populations with impaired access to health care. Increased availability and accessibility of health services for groups with impaired access to health care programs.			**X**
Objective 4:	Community hospitals system. Development of a community hospital system which is innovative, responsive and supplies high quality care to the constituencies it serves.			**X**
Objective 5:	Environmental programs to protect and enhance the environment. Continued development of new environmental protection and health services programs to protect, monitor, and enhance the quality of life in Hawaii.			**X**
Objective 6:	DOH leadership. To improve the Department of Health's ability to meet the public health need of the State of Hawaii in the most appropriate, beneficial and economical way possible.			**X**
Discussion: While the objectives of the Human Services Functional Plan are not directly applicable to the Ho'opili project, the Petitioner supports the plan's objectives and the Department of Health's Healthy Hawai'i Initiative by planning Ho'opili to be easily accessible by walking and bicycle. The site is mostly relatively flat and has been designed to maximize connectivity to surrounding projects such as UHWO and DHHL lands by providing more streets than a conventional development. The higher capacity streets will include grade-separated, multi-purpose walk/bike paths, while smaller streets will allow experienced bicyclist to travel on the roadway, and less-experienced bicyclists to travel on sidewalks. A regional bikeway plan has been developed in cooperation with UHWO, DHHL and HCDA. Figure 2.8: Proposed Circulation Plan shows the approximate alignment of bikeways being proposed by DHHL, UHWO and the Petitioner and how they may connect to bikeways proposed by others (such as HCDA), the bike path shown on the Ewa DP Public Facilities Map, the bikeways shown on the State Bicycle Plan 2003, and park sites proposed by HCDA, DHHL, UHWO and the Petitioner, and possible transit stops (locations being finalized as of this writing). The project will increase the population of 'Ewa, and as such, there will be an occasional and unavoidable demand for emergency medical services. However, existing medical and healthcare facilities in the 'Ewa region and surrounding areas should be able to accommodate the anticipated increase in demand.				
HIGHER EDUCATION FUNCTIONAL PLAN				
Objective A:	A number and variety of postsecondary education institutions			**X**

AR00027233

Hawaii State Functional Plans		S	N/S	N/A
	sufficient to provide the diverse range of programs required to satisfy individual and societal needs and interests.			
Objective B:	The highest level of quality, commensurate with its mission and objectives, of each educational, research, and public service program offered in Hawaii by an institution of higher education.			X
Objective C:	Provide appropriate educational opportunities for all who are willing and able to benefit from postsecondary education.			X
Objective D:	Provide financing for postsecondary education programs sufficient to ensure adequate diversity, high quality, and wide accessibility.			X
Objective E:	Increase program effectiveness and efficiency through better coordination of educational resources.			X
Discussion: While the Higher Education Functional Plan's objectives are not directly applicable to the Ho'opili project, the Petitioner supports the plan's objectives, by coordinating with UHWO (and DHHL) on infrastructure shared by two or more parties, and issues such as the HHCTC project and prioritizing regional roadway improvements.				
HISTORIC PRESERVATION FUNCTIONAL PLAN				
Objective A:	Identification of historic properties.	X		
Objective B:	Protection of historic properties.	X		
Objective C:	Management and treatment of historic properties.	X		
Objective D:	Provision of adequate facilities to preserve historic resources.	X		
Objective E:	The establishment of programs to collect and conserve historic records, artifacts, and/or oral histories and to document and perpetuate traditional arts, skills, and culture.			X
Objective F:	Provision of better access to historic information.			X
Objective G:	Enhancement of skills and knowledge needed to preserve historical resources.			X
Discussion: An archaeological inventory survey report is now accepted in fulfillment of Chapters 13-284 and 13-276, HAR (See Appendix E). A preservation plan and archaeological monitoring plan will be prepared and submitted to SHPD for its review and approval. Should any archaeologically significant artifacts, bones, or other indicators of previous on-site activity be uncovered during construction, work will stop immediately and SHPD will be notified in accordance with applicable regulations.				
HOUSING FUNCTIONAL PLAN				
Objective A:	Homeownership for at least sixty percent, or roughly 248,500 households by the year 2000.			X
Objective B:	Sufficient amount of affordable rental housing units by the year 2000 so as to increase the State's rental vacancy rate to at least 3%, with priority given to increasing the supply of units affordable to very low and lower income households.	X		
Objective C:	Increased development of rental housing units for the elderly and other special need groups to afford them an equal access to housing.	X		
Objective D:	Preservation of existing public and private housing stock.			X
Objective E:	Acquire and designate land suitable for housing development in sufficient amount to locate the deficit in housing units by the year 2000.	X		
Objective F:	Maintain a statewide housing data system for use by public and			X

AR00027234

Hawaii State Functional Plans		S	N/S	N/A
	private agencies engaged in the provision of housing.			
Discussion: The Ho'opili project will construct up to 11,750 residential units of varying housing product types. The Project will consist of for-sale single-family units and multi-family units, with multi-family rental units also available. In accordance with the City and County of Honolulu's affordable housing guidelines, up to 30 percent of the total number of units are expected to be developed as affordable housing units. Details of the affordable housing program in the Ho'opili project that pertain to the regulations and programs of the City and County of Honolulu will be coordinated with the County prior to development.				
HUMAN SERVICES FUNCTIONAL PLAN				
Objective A:	To sustain and improve current elder abuse and neglect services.			X
Objective B:	To increase cost-effective, high quality home and community based services.			X
Objective C:	To increase home-based services to keep children in their homes and to increase placement resources for those children who must be temporarily or permanently removed from their homes, due to abuse or neglect.			X
Objective D:	To address factors that contribute to child abuse and other forms of family violence.			X
Objective E:	To provide affordable, accessible, and quality child care.			X
Objective G:	To provide AFDC recipients with a viable opportunity to become independent of the welfare system.			X
Objective H:	To facilitate client access to human services.			X
Objective I:	To eliminate organizational barriers which limit client access to human services.			X
Discussion: While the objectives of the Human Services Functional Plan are not directly applicable to the Ho'opili project, the Petitioner supports the plan's objectives. The Petitioner has consulted with various private providers such as the Salvation Army (Kroc Center), Child & Family Services, and the Boys and Girls Club.				
RECREATION FUNCTIONAL PLAN				
Objective I.A:	Address the problem of saturation of the capacity of beach parks and near shore waters.			X
Objective I.B:	Reduce the incidence of ocean recreation accidents.			X
Objective I.C:	Resolve conflicts between different activities at heavily used ocean recreation areas.			X
Objective I.D:	Provide adequate boating facilities. Balance the demand for boating facilities against the need to protect the marine environment from potential adverse impacts.			X
Objective II.A:	Plan, develop, and promote recreational activities and facilities in mauka and other areas to provide a wide range of alternatives.	X		
Objective II.B:	Meet special recreation needs of the elderly, the disabled, woman, single-parent families, immigrants, and other groups.			X
Objective II.C:	Improve and expand the provision of recreation facilities in urban areas and local communities.	X		
Objective III.A:	Prevent the loss of access to shoreline and upland recreation areas due to new developments.			X
Objective III.B:	Resolve the problem of landowner liability that seriously hampers public access over private lands.			X

AR00027235

Hawaii State Functional Plans		S	N/S	N/A
Objective III.C:	Increase access to State Forest Reserve lands over federal property, leased State lands, and other government lands.			X
Objective III.D:	Acquire, develop, and manage additional public accessways.			X
Objective IV.A:	Promote a conservation ethic in the use of Hawaii's recreational resources.			X
Objective IV.B:	Prevent degradation of the marine environment.			X
Objective IV.C:	Improve the State's enforcement capabilities.			X
Objective IV.D:	Mitigate adverse impacts of tour helicopters on the quality of recreational experiences in wilderness areas.			X
Objective V.A:	Properly maintain existing parks and recreation areas.			X
Objective V.B:	Promote interagency coordination and cooperation to facilitate sharing of resources, joint development efforts, clarification of responsibilities and jurisdictions, and improvements in enforcement capabilities.	X		
Objective V.C:	Assure adequate support for priority outdoor recreation programs and facilities.	X		
Objective VI.A:	Increase recreational access and opportunities in Hawaii's wetlands.			X
Objective VI.B:	Develop an adequate information base to assist the County planning departments and other regulatory agencies in make decisions regarding wetlands.			X
Objective VI.C:	Assure the protection of the most valuable wetlands in the state.			X
Discussion: The Ho'opili project includes approximately 210 acres for park and open space. The Petitioner proposes a series of parks and open spaces including a district park with active playfields, proposed to be located within the center of the Ho'opili project. In addition, a Canyon Park, located at the southeastern portion of the Ho'opili project, will provide a unique wilderness-type park alternative for residents. A Civic Plaza is envisioned as a community gathering space for outdoor concerts, farmer's markets, and other community events. Interspersed throughout the land use plan is "mini" (neighborhood) parks. The Petitioner consults with UHWO and DHHL on at least a monthly basis and is aware of DPP's requirements for street sections and planting strips (linear greenbelts) for the adjoining landowners and what precedents may have been established for Ho'opili. The Ho'opili project will be designed to facilitate bicycle and pedestrian connectivity between projects. Figure 2.8: Proposed Circulation Plan shows the approximate alignment of bikeways being proposed by DHHL, UHWO and the Petitioner and how they may connect to bikeways proposed by others (such as HCDA), the bike path shown on the Ewa DP Public Facilities Map, the bikeways shown on the State Bicycle Plan 2003, and park sites proposed by HCDA, DHHL, UHWO and the Petitioner, and possible transit stops (locations being finalized as of this writing).				
TOURISM FUNCTIONAL PLAN				
Objective I.A:	Development, implementation and maintenance of policies and actions which support the steady and balanced growth of the visitor industry.			X
Objective II.A:	Development and maintenance of well-designed visitor facilities and related developments which are sensitive to the environment, sensitive to neighboring communities and activities, and adequately serviced by infrastructure and support services.			X
Objective III.A:	Enhancement of respect and regard for the fragile resources which comprise Hawaii's natural and cultural environment.			X

AR00027236

Hawaii State Functional Plans		S	N/S	N/A
	Increased preservation and maintenance efforts.			
Objective IV.A:	Support of Hawaii's diverse range of lifestyles and natural environment.			X
Objective IV.B:	Achievement of mutual appreciation among residents, visitors, and the visitor industry.			X
Objective V.A:	Development of a productive workforce to maintain a high quality visitor industry.			X
Objective V.B:	Enhancement of career and employment opportunities in the visitor industry.			X
Objective VI.A:	Maintenance of a high customer awareness of Hawaii as a visitor destination in specific desired market segments.			X
Discussion: While the objectives of the Tourism Functional Plan are not directly applicable to the Ho'opili project, the Petitioner supports the plan's objectives.				
TRANSPORTATION FUNCTIONAL PLAN				
Objective I.A:	Expansion of the transportation system.	X		
Objective I.B:	Reduction of travel demand through zoning and decentralization initiatives.	X		
Objective I.C:	Management of existing transportation systems through a program of transportation systems management (TSM).			X
Objective I.D:	Identification and reservation of lands and rights-of-way required for future transportation improvements.	X		
Objective I.E:	Planning and designing State highways to enhance inter-regional mobility.			X
Objective I.F:	Improving and enhancing transportation safety.			X
Objective I.G:	Improved transportation maintenance programs.			X
Objective I.H:	Ensure that transportation facilities are accessible to people with disabilities.	X		
Objective II.A:	Development of a transportation infrastructure that supports economic development initiatives.	X		
Objective III.B:	Expansion of revenue bases for transportation improvements.	X		
Objective IV.A:	Providing educational programs.			X
Discussion: The Ho'opili project will generate traffic on local, collector, and regional roads. However, continued development of Kapolei as the Second City and construction of the UHWO campus will help alleviate traffic from leeward and central areas of O'ahu to Honolulu. The Petition Area will be designed to include residential, commercial, recreational, educational, and walking/biking facilities, enabling residents to live, work, play, shop, and learn within the community, thus helping to decentralizing traffic towards the Central Business District in Honolulu. There are several major transportation projects that have been long-planned for 'Ewa. The Ho'opili project has been planned assuming that certain planned transportation projects will be constructed including a portion of North-South Road between Farrington Highway and Kapolei Parkway; a portion of the North-South Road and a new H-1 Freeway interchange; a portion of the intersection of North-South Road and Farrington Highway; the long-planned widening of Farrington Highway fronting Ho'opili; the proposed East-West Connector Road through the Petition Area; and the segment of the proposed Honolulu High-Capacity Transit Corridor project through the Project Area.				
WATER RESOURCES DEVELOPMENT FUNCTIONAL PLAN				
Objective A:	Enunciate State water policy and improve management framework.	X		

AR00027237

Hawaii State Functional Plans		S	N/S	N/A
Objective B:	Maintain the long-term availability of freshwater supplies, giving consideration to the accommodation of important environmental values.	**X**		
Objective C:	Improve management of floodplains.	**X**		
Objective D:	Assure adequate municipal water supplies for planned urban growth.	**X**		
Objective E:	Assure the availability of adequate water for agriculture.			**X**
Objective F:	Encourage and coordinate with other water programs the development of self-supplied industrial water and the production of water-based energy.			**X**
Objective G:	Provide for the protection and enhancement of Hawaii's freshwater and estuarine environment.	**X**		
Objective H:	Improve State grant and loan procedures for water program and projects.			**X**
Objective I:	Pursue water resources data collection and research to meet changing needs.			**X**

Discussion: The Ho'opili project is not expected to impact groundwater resources, as the caprock acts as a barrier to the drinking water in the Project Area. Any runoff or wastewater disposal required for the project will be managed in full compliance with State Department of Health (DOH) regulations.

The project will be maximizing non-potable water usage (via non-potable wells and reclaimed water) to minimize the demand on the potable (i.e., drinking water) system. If a suitable supply is made available, ~~S~~street rights-of-way of the Ho'opili project will have underground non-potable water distribution systems. In addition, it is proposed that the project's greenbelts, parks and roadway medians use non-potable water for irrigation, if a suitable supply will be available. The BWS Water Resources Division will be contacted regarding the availability of recycled water and other non-potable water supplies. It is estimated that the ultimate non-potable water demand for the project will be approximately 2.1 MGD.

Although the City and County of Honolulu's Board of Water Supply (BWS) cannot reserve water for future projects, it has indicated that there is water available to meet the estimated water demand for the project (3.9 MGD). Water Facility Charges paid by the Petitioner will be used by the Board to assist in the source replenishment caused by the project's water demands.

AR00027238

5.3 CITY AND COUNTY OF HONOLULU

5.3.1 General Plan

As required by the City Charter, the *General Plan* for the City and County of Honolulu establishes long-range objectives focusing on the social, economic, environmental, and design objectives for the general welfare and prosperity of the residents of O'ahu. The *General Plan* also establishes broad policies designed to achieve the objectives. Objectives and policies of the *General Plan* are discussed in the table below.

Table 5.7. City and County of Honolulu General Plan – Objectives and Policies

City and County of Honolulu General Plan – Objectives and Policies		S	N/S	N/A
POPULATION				
Objective A: To control the growth of Oahu's resident and visitor populations in order to avoid social, economic, and environmental disruptions.				
Policy 1:	Participate in State and Federal programs which seek to develop social, economic, legal, and environmental controls over population growth.			X
Policy 2:	Seek a balance between the rate of in-migration and the rate of out-migration by reducing in-migration.			X
Policy 3:	Support Federal policies providing for a more even distribution of immigrants throughout the country.			X
Policy 4:	Seek to maintain a desirable pace of physical development through City and County regulations.			X
Policy 5:	Encourage family planning.			X
Policy 6:	Publicize the desire of the City and County to limit population growth.			X
Objective B: To plan for future population growth.				
Policy 1:	Allocate efficiently the money and resources of the City and County in order to meet the needs of Oahu's anticipated future population.			X
Policy 2:	Provide adequate support facilities to accommodate future growth in the number of visitors to Oahu.			X
Objective C: To establish a pattern of population distribution that will allow the people of Oahu to live and work in harmony.				
Policy 1:	Facilitate the full development of the primary urban center.			X
Policy 2:	Encourage development within the secondary urban center at Kapolei and the Ewa and Central Oahu urban-fringe areas to relieve developmental pressures in the remaining urban-fringe and rural areas and to meet housing needs not readily provided in the primary urban center.	X		
Policy 3:	Manage physical growth and development in the urban-fringe and rural areas so that: (a) An undesirable spreading of development is prevented; and (b) Their population densities are consistent with the character of development and environmental qualities desired for such areas.	X		

AR00027239

City and County of Honolulu General Plan – Objectives and Policies		S	N/S	N/A
Policy 4:	(Amended, Resolution 02-205, CD1): Direct growth according to Policies 1, 2, and 3 above by providing land development capacity and needed infrastructure to seek a 2025 distribution of Oahu's residential population	**X**		
Discussion: According to the City and County of Honolulu Department of Planning and Permitting (DPP), the year 2006 population of the *Ewa Development Plan Area* (Ewa DPA) was 86,000 (DPP, 2006). This represented an increase of 25.1 percent from its 2000 population of 68,718. The DPP expects the population of the Ewa DPA to increase to 180.200 by the year 2030. In comparison, the population for the City and County of Honolulu as a whole increased only 3.8 percent from 876,156 to 909,863 between 2000 and 2006. The City and County of Honolulu is expected to experience a population growth of 27.5 percent (241,144 persons) from 876,156 to 1,117,300 total residents during the same 30-year period. Besides providing substantial housing opportunities for the 'Ewa region, the Ho'opili project also supports the State's population distribution policies. The Ho'opili project will provide up to 11,750 units. Assuming the O'ahu 2000 average size of households, the Ho'opili project would increase the overall population by approximately 35,290 residents. The majority of the population moving into the Ho'opili project is expected to come from O'ahu residents relocating from other areas of the island. The population increase is consistent with the City and County of Honolulu's policy to direct future growth to the 'Ewa region. With the population of the Ho'opili project mainly consisting of O'ahu residents that have relocated from other parts of the island, this increase in population has already been incorporated into the City and County of Honolulu's growth projection.				
ECONOMIC ACTIVITY				
Objective A: To promote employment opportunities that will enable all the people of Oahu to attain a decent standard of living.				
Policy 1:	Encourage the growth and diversification of Oahu's economic base.	**X**		
Policy 2:	Encourage the development of small businesses and larger industries, which will contribute to the economic and social well-being of Oahu residents.			**X**
Policy 3:	Encourage the development in appropriate locations on Oahu of trade, communications, and other industries of a nonpolluting nature.	**X**		
Policy 4:	Encourage the development of local, national, and world markets for the products of Oahu-based industries.			**X**
Policy 5:	Encourage the wider distribution of available employment opportunities through such methods as shortening the work-week and reducing the use of overtime.			**X**
Policy 6:	Encourage the continuation of a significant level of Federal employment on Oahu.			**X**
Discussion: This particular objective is mostly directed to governmental agencies and is not directly applicable to the Petition Area. However, it is believed that providing light industrial and business park lands within Ho'opili, near UHWO, will attract high-tech industries, thus diversifying O'ahu's economic base. Providing opportunities for trade, communications, and other industries of a nonpolluting nature in 'Ewa enhances the City of Kapolei as a major employment center.				
Objective B: To maintain the viability of Oahu's visitor industry.				
Policy 1:	Provide for the long-term viability of Waikiki as Oahu's primary resort area by giving the area priority in visitor industry related public expenditures.			**X**
Policy 2:	Provide for a high quality and safe environment for visitors and			**X**

AR00027240

City and County of Honolulu General Plan – Objectives and Policies		S	N/S	N/A
	residents in Waikiki.			
Policy 3:	Encourage private participation in improvements to facilities in Waikiki.			**X**
Policy 4:	Prohibit major increases in permitted development densities in Waikiki.			**X**
Policy 5:	Prohibit further growth in the permitted number of hotel and resort condominium units in Waikiki.			**X**
Policy 6:	Permit the development of secondary resort areas in West Beach, Kahuku, Makaha, and Laie.			**X**
Policy 7:	Manage the development of secondary resort areas in a manner which respects existing lifestyles and the natural environment, and avoids substantial increases in the cost of providing public services in the area.			**X**
Policy 8:	Preserve the well-known and widely publicized beauty of Oahu for visitors as well as residents.			**X**
Policy 9:	Encourage the visitor industry to provide a high level of service to visitors.			**X**
Discussion: This particular objective is not relevant to the proposed project as is best directed public and private tourism-related agencies and companies such as the Hawaii Tourism Authority, DBEDT, the Waikiki Improvement Association, DPP, Visitor Aloha Society of Hawaii, Ko 'Olina Resort, et cetera.				
Objective C: To maintain the viability of agriculture on Oahu.				
Policy 1:	Assist the agricultural industry to ensure the continuation of agriculture as an important source of income and employment.			**X**
Policy 2:	Support agricultural diversification in all agricultural areas on Oahu.			**X**
Policy 3:	Support the development of markets for local products, particularly those with the potential for economic growth.			**X**
Policy 4:	Provide sufficient agricultural land in Ewa, Central Oahu, and the North Shore to encourage the continuation of sugar and pineapple as viable industries.			**X**
Policy 5:	Maintain agricultural land along the Windward, North Shore, and Waianae coasts for truck farming, flower growing, aquaculture, livestock production, and other types of diversified agriculture.			**X**
Policy 6:	Encourage the more intensive use of productive agricultural land.			**X**
Policy 7:	Encourage the use of more efficient production practices by agriculture, including the efficient use of water.			**X**
Policy 8:	Encourage the more efficient use of non-potable water for agricultural use.			**X**
Discussion: The above objective and policies are best directed towards public agencies such as the Department of Agriculture to implement. Over time, the development of the Petition Area will result in the ultimate termination of nearly all of the cultivation that occurs on the property; however, there is an ample supply of land suitable for diversified agriculture on O'ahu and the State of Hawai'i. This includes land in 'Ewa, mauka of the H-1 Freeway, Kunia, Wahiawā and the North Shore.				
Objective D: To make full use of the economic resources of the sea.				
Policy 1:	Assist the fishing industry to maintain its viability.			**X**
Policy 2:	Encourage the development of aquaculture, ocean research, and other ocean- related industries.			**X**

AR00027241

City and County of Honolulu General Plan – Objectives and Policies		S	N/S	N/A
Policy 3:	Focus the development of ocean related economic activities in the Northwestern Hawaiian Islands on those which are compatible with preserving the area's unique environmental, marine, and wildlife assets.			X
Discussion: This particular objective is not relevant to the proposed project.				
Objective E: To prevent the occurrence of large-scale unemployment.				
Policy 1:	Encourage the training and employment of present residents for currently available and future jobs.			X
Policy 2:	Make full use of State and Federal employment and training programs.			X
Policy 3:	Encourage the provision of retraining programs for workers in industries with planned reductions in their labor force.			X
Discussion: This particular objective is probably best directed towards the Department of Labor and Industrial Relations or larger employers who anticipate cutting back their workforce.				
Objective F: To increase the amount of Federal spending on Oahu.				
Policy 1:	Take full advantage of Federal programs and grants which will contribute to the economic and social well being of Oahu's residents.			X
Policy 2:	Encourage the Federal government to pay for the cost of public services used by Federal agencies.			X
Policy 3:	Encourage the Federal government to lease new facilities rather than construct them on tax exempt public land.			X
Policy 4:	Encourage the military to purchase locally all needed services and supplies which are available on Oahu.			X
Discussion: This particular objective is not relevant to the proposed project.				
Objective G: To bring about orderly economic growth on Oahu.				
Policy 1:	Direct major economic activity and government services to the primary urban center and the secondary urban center at Kapolei.	X		
Policy 2:	Permit the moderate growth of business centers in the urban-fringe areas.	X		
Policy 3:	Maintain sufficient land in appropriately located commercial and industrial areas to help ensure a favorable business climate on Oahu.	X		
Policy 4:	Encourage the continuation of a high level of military-related employment in the Hickam-Pearl Harbor, Wahiawa, Kailua-Kaneohe, and Ewa areas.			X
Discussion: The project will generate direct, indirect, and induced jobs both within the Petition Area and on an island-wide basis. These jobs will occur both during construction and after construction as operational employment. At full build out (2030), employment associated with the Petition Area ~~employment~~ is expected to account for approximately 7,000 ~~1,550 net~~ new jobs. Consistent with the Ewa DP and the *Kapolei Area Long Range Master Plan*, the new jobs will generate employment near the City of Kapolei to reduce the need for residents traveling to downtown Honolulu for work-related purposes.				
NATURAL ENVIRONMENT				
Objective A: To protect and preserve the natural environment.				
Policy 1:	Protect Oahu's natural environment, especially the shoreline, valleys, and ridges, from incompatible development.	X		
Policy 2:	Seek the restoration of environmentally damaged areas and natural resources.			X

AR00027242

City and County of Honolulu General Plan – Objectives and Policies		S	N/S	N/A
Policy 3:	Retain the Island's streams as scenic, aquatic, and recreation resources.	X		
Policy 4:	Require development projects to give due consideration to natural features such as slope, flood and erosion hazards, water-recharge areas, distinctive land forms, and existing vegetation.	X		
Policy 5:	Require sufficient setbacks of improvements in unstable shoreline areas to avoid the future need for protective structures.			X
Policy 6:	Design surface drainage and flood-control systems in a manner, which will help preserve their natural settings.	X		
Policy 7:	Protect the natural environment from damaging levels of air, water, and noise pollution.	X		
Policy 8:	Protect plants, birds, and other animals that are unique to the State of Hawaii and the Island of Oahu.			X
Policy 9:	Protect mature trees on public and private lands and encourage their integration into new developments.			X
Policy 10:	Increase public awareness and appreciation of Oahu's land, air, and water resources.			X
Policy 11:	Encourage the State and Federal governments to protect the unique environmental, marine, and wildlife assets of the Northwestern Hawaiian Islands.			X
Discussion: The Petition Area presents little in the way of natural environment except within the confines of Honouliuli Stream or the steep slopes/cliffs on the Old Fort Weaver Road side of the property. The vast remainder of the Petition Area was heavily modified by Oahu Sugar Company when it was in operation and cultivating the land with sugar cane. No development is proposed within Honouliuli Stream or on the steep slopes towards the eastern side of the Petition Area.				
Objective B: To preserve and enhance the natural monuments and scenic views of Oahu for the benefit of both residents and visitors.				
Policy 1:	Protect the Island's well-known resources: its mountains and craters; forests and watershed areas; marshes, rivers, and streams; shoreline, fishponds, and bays; and reefs and offshore islands.	X		
Policy 2:	Protect Oahu's scenic views, especially those seen from highly developed and heavily traveled areas.	X		
Policy 3:	Locate roads, highways, and other public facilities and utilities in areas where they will least obstruct important views of the mountains and the sea.	X		
Policy 4:	Provide opportunities for recreational and educational use and physical contact with Oahu's natural environmental.	X		
	(11) Identify all areas where priority should be given to preserving rural character and lifestyle.			X
	(12) Utilize Hawai'i's limited land resources wisely, providing adequate land to accommodate projected population and economic growth needs while ensuring the protection of the environment and the availability of the shoreline, conservation lands, and other limited resources for future generations.	X		
	(13) Protect and enhance Hawai'i's shoreline, open spaces, and scenic resources.	X		
Discussion: The only major resources in the vicinity of the Petition Area are the ocean and the Wai'anae and Ko'olau mountain ranges. The most heavily traveled roads in the vicinity of the				

AR00027243

City and County of Honolulu General Plan – Objectives and Policies		S	N/S	N/A
project site are Fort Weaver Road and the H-1 Freeway. A vast majority of the project site is not visible from Fort Weaver Road, because it is set back and 30 to 40 feet higher than Fort Weaver Road. Since the Petition Area is west of Fort Weaver Road, development of the Petition Area will not obstruct views of the Ko'olau Mountains from either Fort Weaver (or the H-1 Freeway). The development of the Petition Area will also not likely obstruct views of the Wai'anae Mountain range. There are presently no views towards the ocean from the portion of Fort Weaver Road between the H-1 Freeway and the Child and Family Services Complex (near the southeast corner of the Petition Area). There are occasional views towards the ocean and Diamond Head in the far distance across the project site from the high-speed H-1 Freeway. Development of the Petition Area may alter these views, but it should be noted that views of 'Ewa, in its present, is not just of agricultural fields but also of a major electrical substation site, as well as 138kV lines mounted on tall metal poles. Also, the City and County of Honolulu is proposing an elevated rail transit system as part of the HHCTC project through the project site and along North-South Road.				
HOUSING				
Objective A: To provide decent housing for all the people of Oahu at prices they can afford.				
Policy 1:	Develop programs and controls, which will provide decent homes at the least possible cost.			X
Policy 2:	Streamline approval and permit procedures for housing and other development projects.			X
Policy 3:	Encourage innovative residential development, which will result in lower costs, added convenience and privacy, and the more efficient use of streets and utilities.	X		
Policy 4:	Establish public, and encourage private, programs to maintain and improve the condition of existing housing.			X
Policy 5:	Make full use of State and Federal programs that provide financial assistance for low- and moderate-income homebuyers.			X
Policy 6:	Expand local funding mechanisms available to pay for government housing programs.			X
Policy 7:	Provide financial and other incentives to encourage the private sector to build homes for low and moderate- income residents.	X		
Policy 8:	Encourage and participate in joint public- private development of low- and moderate- income housing.			X
Policy 9:	Encourage the preservation of existing housing which is affordable to low- and moderate-income persons.			X
Policy 10:	Promote the construction of affordable dwellings, which take advantage of Oahu's year-round moderate climate.	X		
Policy 11:	Encourage the construction of affordable homes within established low-density communities by such means as "ohana" units, duplex dwellings, and cluster development.			X
Policy 12:	Encourage the production and maintenance of affordable rental housing.	X		
Policy 13:	Encourage the provision of affordable housing designed for the elderly and the handicapped.	X		
Policy 14:	Encourage equitable relationships between landowners and leaseholders, between landlords and tenants, and between condominium developers and owners.			X
Discussion: While this particular objective is mostly directed to governmental agencies, the Petitioner supports the above *General Plan's* objectives and policies and in accordance with the City and County of Honolulu's affordable housing guidelines, by planning up to 30 percent of the total				

AR00027244

City and County of Honolulu General Plan – Objectives and Policies		S	N/S	N/A
number of units as affordable housing units. Details of the affordable housing program in the Ho'opili project that pertain to the regulations and programs of the City and County of Honolulu will be coordinated with the County prior to development.				
Objective B: To reduce speculation in land and housing.				
Policy 1:	Encourage the State government to coordinate its urban-area designations with the developmental policies of the City and County.			X
Policy 2:	Discourage private developers from acquiring and assembling land outside of areas planned for urban use.	X		
Policy 3:	Seek public benefits from increases in the value of land owing to City and State developmental policies and decisions.			X
Policy 4:	Require government-subsidized housing to be delivered to appropriate purchasers and renters.			X
Policy 5:	Prohibit the selling or renting of government-subsidized housing for large profits.			X
Discussion: While this particular objective is mostly directed to governmental agencies, the Petitioner supports the above *General Plan's* objectives and policies by proposing development on land long-planned for urban use, and well within (and makai of) the Urban Growth Boundary as shown on the current *Ewa Development Plan* Land Use Map.				
Objective C: To provide the people of Oahu with a choice of living environments which are reasonably close to employment, recreation, and commercial centers and which are adequately served by public utilities.				
Policy 1:	Encourage residential developments that offer a variety of homes to people of different income levels and to families of various sizes.	X		
Policy 2:	Encourage the fair distribution of low- and moderate-income housing throughout the Island.	X		
Policy 3:	Encourage residential development near employment centers.	X		
Policy 4:	Encourage residential development in areas where existing roads, utilities, and other community facilities are not being used to capacity.	X		
Policy 5:	Discourage residential development where roads, utilities, and community facilities cannot be provided at a reasonable cost.			X
Policy 6:	Preserve older communities through self-help, housing-rehabilitation, improvement districts, and other governmental programs.			X
Discussion: The Ho'opili project will construct up to 11,750 residential units of varying product types. The Project will consist of for-sale single-family units and multi-family units, with multi-family rental units also available. In accordance with the City and County of Honolulu's affordable housing guidelines, up to 30 percent of the total number of units are expected to be developed as affordable housing units. The proposed project is envisioned as a new kind of development, one that improves the quality of people's lives by allowing them to live, work, learn, shop and play in their own community.				
TRANSPORTATION AND UTILITIES				
Objective A: To create a transportation system which will enable people and goods to move safely, efficiently, and at a reasonable cost, serve all people, including the poor, the elderly, and the physically handicapped; and offer a variety of attractive and convenient modes of travel.				
Policy 1:	Develop and maintain an integrated ground-transportation system consisting of the following elements and their primary	X		

AR00027245

City and County of Honolulu General Plan – Objectives and Policies		S	N/S	N/A
	purposes:			
	a) Public transportation-for travel to and from work, and travel within Central Honolulu;			X
	b) Roads and highways-for commercial traffic and travel in non-urban areas;			X
	c) Bikeways-for recreational activities and trips to work, schools, shopping centers, and community facilities; and	X		
	d) Pedestrian walkways-for getting around Downtown and Waikiki, and for trips to schools, parks, and shopping centers.	X		
Policy 2:	Provide transportation services to people living within the Ewa, Central Oahu, and Pearl City-Hawaii Kai corridors primarily through a mass transit system including exclusive right-of-way rapid transit and feeder-bus components as well as through the existing highway system with limited improvements as may be appropriate.	X		
Policy 3:	Provide transportation services outside the Ewa, Central Oahu, and Pearl City-Hawaii Kai corridors primarily through a system of express- and feeder-buses as well as through the highway system with limited to moderate improvements sufficient to meet the needs of the communities being served.			X
Policy 4:	Improve transportation facilities and services in the Ewa corridor and in the trans-Ko'olau corridors to meet the needs of Ewa and Windward communities.	X		
Policy 5:	Improve roads in existing communities to reduce congestion and eliminate unsafe conditions.			X
Policy 6:	Consider both environmental impact as well as construction and operating costs as important factors in planning alternative nodes of transportation.	X		
Policy 7:	Promote the use of public transportation as a means of moving people quickly and efficiently, of conserving energy, and of guiding urban development.	X		
Policy 8:	Make available transportation services to people with limited mobility: the young, the elderly, the handicapped, and the poor.			X
Policy 9:	Promote programs to reduce dependence on the use of automobiles.			X
Policy 10:	Discourage the inefficient use of the private automobile, especially in congested corridors and during peak- hours.	X		
Policy 11:	Make public, and encourage private, improvements to major walkway systems.	X		
Policy 12:	Encourage the provision of separate aviation facilities for small civilian aircraft.			X
Policy 13:	Facilitate the development of a second deep-water harbor to relieve congestion in Honolulu Harbor.			X
Discussion: There are several major transportation projects that have been long-planned for 'Ewa. The Ho'opili project has been planned assuming that certain planned transportation projects will be constructed including a portion of North-South Road between Farrington Highway and Kapolei Parkway; a portion of the North-South Road and a new H-1 Freeway interchange; a portion of the intersection of North-South Road and Farrington Highway; the long-planned widening of Farrington Highway fronting Ho'opili; the proposed East-West Connector Road through the Petition Area; and				

AR00027246

City and County of Honolulu General Plan – Objectives and Policies		S	N/S	N/A
the segment of the proposed Honolulu High-Capacity Transit Corridor project through the Project Area. The proposed project has been designed to reduce future residents' reliance on private motorized vehicles through the following measures: • Ho'opili is the first new project designed to ~~embrace~~ support high-capacity transit (elevated, fixed-guideway) corridor and station(s); • the Petition Area is large enough to be designed and offer a full range of mixed land uses, including a wide range of places of live, work, shop, recreate and learn and will aspire to achieve a job-housing balance; • Ho'opili is designed to maximize connectivity (transit, pedestrian, bicycle and vehicular) with surrounding streets and communities (including DHHL and UHWO), while minimizing cul-de-sacs and dead-end streets; • Ho'opili will be designed to take advantage of the relatively flatness of the site and proximity to UHWO by designing streets and grade-separated multi-modal pathways for walking and bicycling; and • the Petitioner will seek to implement other transportation management and transportation demand management (TDM) strategies (such as requesting that the State/County consider extending or instituting contra-flow of major transportation corridors during a.m. and p.m. peak travel times). The most important TDM strategy is that the project is designed to ~~embrace~~ support both rail and bus transit and the project is proposed to have mixed uses over most of the entire Petition Area.				
Objective B: To meet the needs of the people of Oahu for an adequate supply of water and for environmentally sound systems of waste disposal.				
Policy 1:	Develop and maintain an adequate supply of water for both residents and visitors.			**X**
Policy 2:	Develop and maintain an adequate supply of water for agricultural and industrial needs.			**X**
Policy 3:	Encourage the development of new technology, which will reduce the cost of providing water and the cost of waste disposal.			**X**
Policy 4:	Encourage a lowering of the per-capita consumption of water and the per-capita production of waste.	**X**		
Policy 5:	Provide safe, efficient, and environmentally sensitive waste-collection and waste-disposal services.	**X**		
Policy 6:	Support programs to recover resources from solid-waste and recycle wastewater.	**X**		
Policy 7:	Require the safe disposal of hazardous waste.			**X**

AR00027247

City and County of Honolulu General Plan – Objectives and Policies		S	N/S	N/A
Discussion: The Petitioner has identified in the Water Master Plan the source requirement to support the project, including allotting adequate water supply for its existing agricultural lessees, as long as they are operating on the Petition Area. The Petitioner will equip the homes it constructs with appliances and fixtures that encourage a lower per capita consumption of water. The Petitioner will assume the City and County of Honolulu will extend its curbside recycling services into the Petition Area and will design its streets accordingly. The Petitioner will be maximizing non-drinking usage to minimize the demand on the safe drinking water supply. If a suitable supply is made available, ~~S~~street right of ways of the Ho'opili project will have underground non-potable water distribution systems. It is proposed to upgrade the existing non-drinking source (EP 5 & 6 located within Parcel C) to a BWS dedicable standard to be used as the source for the non-drinking system. It is also proposed to ultimately allow for future dedication of the non-drinking system. It is estimated that the ultimate non-drinking demand for the project will be approximately 2.1 MGD. The Petitioner will consider the use of drought tolerant/low water use plants and the implementation of xeriscaping principles for landscaping within the Ho'opili project to the extent practicable. The installation of an efficient irrigation system, possibly using drip irrigation, will be considered in the design of the project where feasible. Moisture sensors to avoid the operation of the system in the rain and if the ground has adequate moisture would be incorporated into the irrigation system, where feasible. Another source of non-potable water is reclaimed water. The Honolulu Board of Water Supply (BWS) entered into the water recycling business in 2000 by purchasing the Honouliuli Water Reclamation Facility. Water recycling of treated wastewater effluent is one element of a broader BWS strategy to protect O'ahu's aquifers and to conserve water resources through conservation and development of new water supplies. Treated effluent from the facility is now irrigating golf courses that were once using brackish water, including West Loch, 'Ewa Villages, Hawai'i Prince, and Coral Creek. The facility is also providing recycled water (at a different level of treatment) to industries at Campbell Industrial Park. The project will be maximizing the use of non-potable water for irrigation to minimize the impact on the drinking water source component of the BWS system. It is proposed that the project's greenbelts, parks and roadway medians use non-potable water for irrigation, if a suitable supply will be available. The BWS Water Resources Division will be contacted regarding the availability of recycled water and other non-potable water supplies.				
Objective C: To maintain a high level of service for all utilities.				
Policy 1:	Maintain existing utility systems in order to avoid major breakdowns.			**X**
Policy 2:	Provide improvements to utilities in existing neighborhoods to reduce substandard conditions.			**X**
Policy 3:	Plan for the timely and/or orderly expansion of utility systems.			**X**
Policy 4:	Increase the efficiency of public utilities by encouraging a mixture of uses with peak periods of demand occurring at different times of the day.			**X**
Discussion: While this particular objective is mostly directed to public utility companies, the Petitioner supports the above *General Plan's* objectives and policies by coordinating with companies such as HECO and other energy providers in the planning stage of the project.				
Objective D: To maintain transportation and utility systems which will help Oahu continue to be a desirable place to live and visit.				
Policy 1:	Give primary emphasis in the capital-improvement program to the maintenance and improvement of existing roads and utilities.			**X**

AR00027248

City and County of Honolulu General Plan – Objectives and Policies		S	N/S	N/A
Policy 2:	Use the transportation and utility systems as a means of guiding growth and the pattern of land use on Oahu.			X
Policy 3:	Encourage the study and use of telecommunications as an alternative to conventional transportation facilities.			X
Policy 4:	Evaluate the social, economic, and environmental impact of additions to the transportation and utility systems before they are constructed.	X		
Policy 5:	Require the installation of underground utility lines wherever feasible.	X		
Policy 6:	Seek improved taxing powers for the City and County in order to provide a more equitable means of financing transportation and utility services.			X
Discussion: There are several major transportation projects that have been long-planned for 'Ewa. The Ho'opili project has been planned assuming that certain planned transportation projects will be constructed including a portion of North-South Road between Farrington Highway and Kapolei Parkway; a portion of the North-South Road and a new H-1 Freeway interchange; a portion of the intersection of North-South Road and Farrington Highway; the long-planned widening of Farrington Highway fronting Ho'opili; the proposed East-West Connector Road through the Petition Area; and the segment of the proposed Honolulu High-Capacity Transit Corridor project through the Project Area. While the specific nature of transportation and utility system improvements is not known at this time, this EIS is intended to address all current and future instances involving the use of State and/or County lands and funds relating to the Ho'opili project. To minimize visual impacts, all utility lines will be underground except those that have already been installed by HECO, BWS and other public or private utility companies. The Petitioner is very interested in utilizing Community Facilities District (CFD) financing as a means to pay for required transportation and other infrastructure improvements.				
ENERGY				
Objective A: To maintain an adequate, dependable, and economical supply of energy for Oahu residents.				
Policy 1:	Develop and maintain a comprehensive plan to guide and coordinate energy conservation and alternative energy development and utilization programs on Oahu.			X
Policy 2:	Establish economic incentives and regulatory measures which will reduce Oahu's dependence on petroleum as its primary source of energy.			X
Policy 3:	Support programs and projects which contribute to the attainment of energy self-sufficiency on Oahu.			X
Policy 4:	Promote and assist efforts to establish adequate petroleum reserves within Hawaii's boundaries.			X
Policy 5:	Give adequate consideration to environmental, public health, and safety concerns, to resource limitations, and to relative costs when making decisions concerning alternatives for conserving energy and developing natural energy resources.	X		
Policy 6:	Work closely with the State and Federal governments in the formulation and implementation of all City and County energy-			X

AR00027249

City and County of Honolulu General Plan – Objectives and Policies		S	N/S	N/A
	related programs.			
Discussion: Nearly all of the above policies are best directed to public or private agencies which provide energy, however the Petitioner is supportive of developing natural energy resources. The Petitioner is considering the potential of developing another source of electrical power.				
Objective B: To conserve energy through the more efficient management of its use.				
Policy 1:	Ensure that the efficient use of energy is a primary factor in the preparation and administration of land use plans and regulations.	X		
Policy 2:	Provide incentives and, where appropriate, mandatory controls to achieve energy-efficient siting and design of new developments.			X
Policy 3:	Carry out public, and promote private, programs to more efficiently use energy in existing buildings and outdoor facilities.	X		
Policy 4:	Promote the development of an energy-efficient transportation system.	X		
Discussion: Nearly all of the above policies are best directed to public or private agencies which provide expertise on energy conservation, however, the Petitioner is supportive of conserving energy resources. Based on DBEDT Strategic Industries Division's recommendations, the Petitioner's mechanical and electrical consultants, in consultation with its sustainability consultant, will be directed to review the City and County of Honolulu's Energy Code early in the project and to consult with Hawaiian Electric Company, Inc. (HECO) on demand-side management programs that offer rebates for installation of energy-efficient technologies (including solar power and energy-efficient appliances). The project will provide various housing and employment opportunities for the rapidly growing 'Ewa region, which will, in turn, reduce the number energy-consuming commuter trips to other areas of O'ahu, particularly downtown Honolulu				
Objective C: To fully utilize proven alternative sources of energy.				
Policy 1:	Encourage the use of commercially available solar energy systems in public facilities, institutions, residences, and business developments.	X		
Policy 2:	Support the increased use of operational solid waste energy recovery and other biomass energy conversion systems.			X
Discussion: Based on DBEDT Strategic Industries Division's recommendations, the Petitioner's mechanical and electrical consultants, in consultation with its sustainability consultant, will be directed to review the City and County of Honolulu's Energy Code early in the project and to consult with Hawaiian Electric Company, Inc. (HECO) on demand-side management programs that offer rebates for installation of energy-efficient technologies (including solar power and energy-efficient appliances). The Petitioner is supportive of plans to both expand H-Power (solid waste energy recovery) and HECO's planned power plant that would burn biomass as fuel.				
Objective D: To develop and apply new, locally available energy resources.				
Policy 1:	Support and participate in research, development, demonstration, and commercialization programs aimed at producing new, economical, and environmentally sound energy supplies from:			X
	a) solar insulation;	X		
	b) biomass energy conversion;			X
	c) wind energy conversion;			X
	d) geothermal energy; and			X
	e) ocean thermal energy conversion.			X

AR00027250

City and County of Honolulu General Plan – Objectives and Policies		S	N/S	N/A
Policy 2:	Secure State and Federal support of City and County efforts to develop new sources of energy.			**X**
Discussion: Nearly all of the above policies are best directed to public or private agencies which provide energy, however the Petitioner is supportive of developing natural energy resources. The Petitioner is considering the potential of developing another source of electrical power.				
Objective E: To establish a continuing energy information program.				
Policy 1:	Supply citizens with the information they need to fully understand the potential supply, cost, and other problems associated with Oahu's dependence on imported petroleum.			**X**
Policy 2:	Foster the development of an energy conservation ethic among Oahu residents.			**X**
Policy 3:	Keep consumers informed about available alternative energy sources and their costs and benefits.			**X**
Policy 4:	Provide information concerning the impact of public and private decisions on future energy use.			**X**
Discussion: While this particular objective is mostly directed to public utility companies and agencies such as DBEDT, the Petitioner supports the above *General Plan*'s objectives and policies.				
PHYSICAL DEVELOPMENT AND URBAN DESIGN				
Objective A: To coordinate changes in the physical environment of Oahu to ensure that all new developments are timely, well-designed, and appropriate for the areas in which they will be located.				
Policy 1:	Plan for the construction of new public facilities and utilities in the various parts of the Island according to the following order of priority: first, in the primary urban center; second, in the secondary urban center at Kapolei; and third, in the urban-fringe and rural areas.	**X**		
Policy 2:	Coordinate the location and timing of new development with the availability of adequate water supply, sewage treatment, drainage, transportation, and public safety facilities.	**X**		
Policy 3:	Phase the construction of new developments so that they do not require more regional supporting services than are available.	**X**		
Policy 4:	Require new developments to provide or pay the cost of all essential community services, including roads, utilities, schools, parks, and emergency facilities that are intended to directly serve the development.	**X**		
Policy 5:	Provide for more compact development and intensive use of urban lands where compatible with the physical and social character of existing communities.	**X**		
Policy 6:	Encourage the clustering of developments to reduce the cost of providing utilities and other public services.	**X**		
Policy 7:	Locate new industries and new commercial areas so that they will be well related to their markets and suppliers, and to residential areas and transportation facilities.	**X**		
Policy 8:	Locate community facilities on sites that will be convenient to the people they are intended to serve.	**X**		
Policy 9:	Exclude from residential areas, uses which are major sources of noise and air pollution.	**X**		
Policy 10:	Establish danger zones to exclude incompatible uses from hazardous areas surrounding airfields, electromagnetic-radiation sources, and storage places for fuel and explosives.			**X**

AR00027251

City and County of Honolulu General Plan – Objectives and Policies		S	N/S	N/A
Policy 11:	Prohibit new airfields, electromagnetic-radiation sources, and storage places for fuel and explosives from locating on sites where they will endanger or disrupt nearby communities.			X
Discussion: The Petition Area is located within the secondary urban center. The Petitioner has been coordinating with other 'Ewa developments to jointly develop adequate water storage and transmission, wastewater collection lines, connecting streets and bikeways, high capacity transit corridors and other infrastructure. As UHWO and DHHL will be developed before Ho'opili, much of the jointly developed off-site infrastructure will be in place before the Petition Area will be able to secure the necessary major land use approvals. Ho'opili has been designed to accommodate long-planned regional roadways, the HHCTC alignment, the proposed East-West Connector Road, land for five public schools, park land to meet park dedication requirements, and land for either a fire, a police and/or an emergency center. As the last major landholding within the Urban Growth Boundary, the Petitioner understands that there is not much developable land on O'ahu and Ho'opili will represent more compact development and intensive use of urban land than other projects in 'Ewa. While Ho'opili will be a mixed use development, no heavy industrial is proposed or uses which are major sources of noise and air pollution.				
Objective B: To develop Honolulu (Waialae-Kahala to Halawa), Aiea, and Pearl City as the Island's primary urban center.				
Policy 1:	Stimulate development in the primary urban center by means of the City and County's capital improvement program and State and Federal grant and loan programs.			X
Policy 2:	Provide for the expanded development of low-rise multi-unit housing.			X
Policy 3:	Encourage the establishment of mixed-use districts with appropriate design and development controls to insure an attractive living environment and compatibility with surrounding land uses.			X
Policy 4:	Provide downtown Honolulu and other major business centers with a well-balanced mixture of uses.			X
Policy 5:	Encourage the development of attractive residential communities in downtown and other business centers.			X
Policy 6:	Maintain and improve downtown as the financial and office center of the Island, and as a major retail center.			X
Policy 7:	Provide for the continued viability of the Hawai'i Capital District as a center of government activities and as an attractive park-like setting in the heart of the City.			X
Policy 8:	Foster the development of Honolulu's waterfront as the State's major port and maritime center, as a people- oriented mixed-use area, and as a major recreation area.			X
Policy 9:	Facilitate the redevelopment of Kakaako as a major residential, as well as commercial and light industrial area.			X
Discussion: This particular objective and accompanying policies are not relevant to the proposed project.				
Objective C:	To develop a secondary urban center in Ewa with its nucleus in the Kapolei area.			
Policy 1:	Allocate funds from the City and County's capital-improvement program for public projects that are needed to facilitate development of the secondary urban center at Kapolei.			X
Policy 2:	Encourage the development of a major residential, commercial, and employment center within the secondary urban center at Kapolei.	X		

AR00027252

City and County of Honolulu General Plan – Objectives and Policies		S	N/S	N/A
Policy 3:	Encourage the continuing development of Barbers Point as a major industrial center.			**X**
Policy 4:	Coordinate plans for the development of the secondary urban center at Kapolei with the State and Federal governments and with the sugar industry.	**X**		
Policy 5:	Cooperate with the State and Federal governments in the development of a deep water harbor at Barbers Point.			**X**
Policy 6:	Encourage the development of the Ewa Marina Community as a major residential and recreation area emphasizing recreational boating activities through the provision of a major marina and a related maritime commercial center containing light-industrial, commercial, and visitor accommodation uses.			**X**
Discussion: Ho'opili involves mixed-use development (including residential, commercial and employment) within the secondary urban center. The Petitioner has consistently sought to communicate and coordinate with Federal, State and County agencies on various issues such as the concurrency of required infrastructure improvements, schools and the HHCTC alignment.				
Objective D: To maintain those development characteristics in the urban-fringe and rural areas which make them desirable places to live.				
Policy 1:	Develop and maintain urban fringe areas as predominantly residential areas characterized by generally low rise, low density development which may include significant levels of retail and service commercial uses as well as satellite institutional and public uses geared to serving the needs of households.	**X**		
Policy 2:	Coordinate plans for developments within the Ewa and Central Oahu urban-fringe areas with the State and Federal governments and with the sugar, pineapple, and other emerging agricultural industries.	**X**		
Policy 3:	Establish a green belt in the Ewa and Central Oahu areas of Oahu in the Development Plans.	**X**		
Policy 4:	Maintain rural areas as areas which are intended to provide environments supportive of lifestyle choices which are dependent on the availability of land suitable for small to moderate size agricultural pursuits, a relatively open and scenic setting, and/or a small town, country atmosphere consisting of communities which are small in size, very low density and low rise in character, and may contain a mixture of uses.			**X**
Discussion: The proposed project is generally supportive of Objective D, Policy 1 except that since developable land area on O'ahu is very scarce, Ho'opili will be predominately residential, but most of the units are envisioned to be multi-family and thus cannot not be characterized as being "generally low rise, low density development..."The Petitioner has been coordinating with County, State and Federal agencies, as well as neighboring proposed projects (such as UHWO, and DHHL East Kapolei Development Parcels 1 and 2, and Kalaeloa) early in the planning process. Ho'opili has been designed to include major green belts through and around portions of the Petition Area.				
Objective E: To create and maintain attractive, meaningful, and stimulating environments throughout Oahu.				
Policy 1:	Prepare and maintain a comprehensive urban-design plan for the Island of Oahu.			**X**
Policy 2:	Integrate the City and County's urban-design plan into all levels of physical planning and developmental controls.			**X**

AR00027253

City and County of Honolulu General Plan – Objectives and Policies		S	N/S	N/A
Policy 3:	Encourage distinctive community identities for both new and existing districts and neighborhoods.	X		
Policy 4:	Require the consideration of urban-design principles in all development projects.			X
Policy 5:	Require new developments in stable, established communities and rural areas to be compatible with the existing communities and areas.	X		
Policy 6:	Provide special design standards and controls that will allow more compact development and intensive use of lands in the primary urban center.			X
Policy 7:	Promote public and private programs to beautify the urban and rural environments.			X
Policy 8:	Preserve and maintain beneficial open space in urbanized areas.	X		
Policy 9:	Design public structures to meet high aesthetic and functional standards and to complement the physical character of the communities they will serve.			X
Policy 10:	Establish a review process to evaluate the design of major development projects.			X
Discussion: Ho'opili will be designed to acknowledge its role as the "gateway" to the Secondary Urban Center, while acknowledging and reflecting the character of Kapolei, 'Ewa Villages and the proposed UH West O'ahu. The Petition Area is large enough to consist of a number of smaller neighborhoods, roughly delineated by a comfortable walking distance from the center of each neighborhood. It is possible then, that each neighborhood will be designed with a distinctive character, but eventually will assuredly develop its own unique character. The project will include open space including along the H-1 Freeway and along the bluffs paralleling Old Fort Weaver Road.				
Objective F: To promote and enhance the social and physical character of Oahu's older towns and neighborhoods.				
Policy 1:	Encourage new construction to complement the ethnic qualities of the older communities of Oahu.			X
Policy 2:	Encourage, wherever desirable, the rehabilitation of existing substandard structures.			X
Policy 3:	Provide and maintain roads, public facilities, and utilities without damaging the character of older communities.			X
Policy 4:	Seek the satisfactory relocation of residents before permitting their displacement by new development, redevelopment, or neighborhood rehabilitation.			X
Discussion: This particular objective and accompanying policies related to O'ahu's older towns and neighborhoods is not relevant to the proposed project.				
PUBLIC SAFETY				
Objective A: To prevent and control crime and maintain public order.				
Policy 1:	Provide a safe environment for residents and visitors on Oahu.	X		
Policy 2:	Provide adequate criminal justice facilities and staffing for City and County law- enforcement agencies.			X
Policy 3:	Emphasize improvements to police and prosecution operations which will result in a higher proportion of wrongdoers who are arrested, convicted, and punished for their crimes.			X
Policy 4:	Keep the public informed of the nature and extent of criminal activity on Oahu.			X
Policy 5:	Establish and maintain programs to encourage public			X

AR00027254

City and County of Honolulu General Plan – Objectives and Policies		S	N/S	N/A
	cooperation in the prevention and solution of crimes.			
Policy 6:	Seek the help of State and Federal law- enforcement agencies to curtail the activities of organized crime syndicates on Oahu.			X
Policy 7:	Conduct periodic reviews of criminal laws to ensure their relevance to the community's needs and values.			X
Policy 8:	Cooperate with other law-enforcement agencies to develop new methods of fighting crime.			X
Policy 9:	Encourage the improvement of rehabilitation programs and facilities for criminals and juvenile offenders.			X
Discussion: This particular objective and accompanying policies are mostly directed to law enforcement and other governmental agencies, however, the concept of "defensible space" will be incorporated into the design of Ho'opili.				
Objective B: To protect the people of Oahu and their property against natural disasters and other emergencies, traffic and fire hazards, and unsafe conditions.				
Policy 1:	Keep up-to-date and enforce all City and County safety regulations.			X
Policy 2:	Require all developments in areas subject to floods and tsunamis to be located and constructed in a manner that will not create any health or safety hazard.			X
Policy 3:	Participate with State and Federal agencies in the funding and construction of flood-control projects.			X
Policy 4:	Cooperate with State and Federal agencies to provide tsunami warning and protection for Oahu.			X
Policy 5:	Cooperate with State and Federal agencies to provide protection from war, civil disruptions, and other major disturbances.			X
Policy 6:	Reduce hazardous traffic conditions.	X		
Policy 7:	Provide adequate fire protection and effective fire prevention programs.			X
Policy 8:	Provide adequate search and rescue and disaster response services.			X
Policy 9:	Design safe and secure public buildings.			X
Policy 10:	Provide adequate staff to supervise activities at public facilities.			X
Policy 11:	Develop civil defense plans and programs to protect and promote public health, safety and welfare of the people.			X
Policy 12:	Provide educational materials on civil defense preparedness, fire protection, traffic hazards and other unsafe conditions.			X
Discussion: This particular objective and accompanying policies are mostly directed to civil defense and other governmental agencies. It should be noted that the areas to be developed within the Petition Area are not subject to floods or tsunamis. Of the existing roads in the area, Farrington Highway is often cited for the frequency of accidents and has long been planned for widening. The Petitioner is supportive of this long-planned widening and is aware that this widening will require condemnation of land from the Petition Area.				
HEALTH AND EDUCATION				
Objective A: To protect the health of the people of Oahu.				
Policy 1:	Encourage the provision of health-care facilities that are accessible to both employment and residential centers.			X
Policy 2:	Encourage prompt and adequate ambulance and first-aid services in all areas of Oahu.			X
Policy 3:	Coordinate City and County health codes and other regulations			X

AR00027255

City and County of Honolulu General Plan – Objectives and Policies		S	N/S	N/A
	with State and Federal health codes to facilitate the enforcement of air-, water-, and noise-pollution controls.			
Discussion: This particular objective and accompanying policies are mostly directed to private health care providers and other governmental agencies, however, the Petition Area is located near the Hawai'i Medical Center West. The City and County of Honolulu has 18 emergency medical services Advanced Life Support Ambulance units and two Rapid Response Paramedic units on O'ahu. Two of the Advanced Life Support Ambulance units are located nearby, one at the Kapolei Fire Station, the other at the Waipahu Fire Station. One of the Rapid Response Paramedic units is located at the nearby Hawai'i Medical Center West.				
Objective B: To provide a wide range of educational opportunities for the people of Oahu.				
Policy 1:	Support education programs that encourage the development of employable skills.			X
Policy 2:	Encourage the provision of informal educational programs for people of all age groups.			X
Policy 3:	Encourage the after-hours use of school buildings, grounds, and facilities.			X
Policy 4:	Encourage the construction of school facilities that are designed for flexibility and high levels of use.			X
Policy 5:	Facilitate the appropriate location of learning institutions from the preschool through the university levels.	X		
Discussion: This particular objective and accompanying policies are mostly directed to the State Department of Education and other governmental agencies. The Petitioner has met with State Department of Education staff to review the proposed location of public school sites (elementary, middle and high) throughout Ho'opili.				
Objective C: To make Honolulu the center of higher education in the Pacific.				
Policy 1:	Encourage continuing improvement in the quality of higher education in Hawaii.			X
Policy 2:	Encourage the development of diverse opportunities in higher education.			X
Policy 3:	Encourage research institutions to establish branches on Oahu.			X
Discussion: This particular objective and accompanying policies are mostly directed to public and private institutions of higher learning, however, the Petitioner is very supportive of UHWO and its plans for a new campus adjoining Ho'opili.				
CULTURE AND RECREATION				
Objective A: To foster the multiethnic culture of Hawaii.				
Policy 1:	Encourage the preservation and enhancement of Hawaii's diverse cultures.			X
Policy 2:	Encourage greater public awareness, understanding, and appreciation of cultural heritage and contributions to Hawaii made by the City's various ethnic groups.			X
Policy 3:	Encourage opportunities for better interaction among people with different ethnic, social, and cultural backgrounds.			X
Policy 4:	Encourage the protection of the ethnic identities of the older communities of Oahu.			X
Discussion: This particular objective and accompanying policies are mostly directed to governmental agencies.				
Objective B: To protect Oahu's cultural, historic, architectural, and archaeological resources.				
Policy 1:	Encourage the restoration and preservation of early Hawaiian structures, artifacts, and landmarks.			X

AR00027256

City and County of Honolulu General Plan – Objectives and Policies		S	N/S	N/A
Policy 2:	Identify, and to the extent possible, preserve and restore buildings, sites, and areas of social, cultural, historic, architectural, and archaeological significance.	X		
Policy 3:	Cooperate with the State and Federal governments in developing and implementing a comprehensive preservation program for social, cultural, historic, architectural, and archaeological resources.	X		
Policy 4:	Promote the interpretive and educational use of cultural, historic, architectural, and archaeological sites, buildings, and artifacts.	X		
Policy 5:	Seek public and private funds, and public participation and support, to protect social, cultural, historic, architectural, and archaeological resources.			X
Policy 6:	Provide incentives for the restoration, preservation, and maintenance of social, cultural, historic, architectural, and archaeological resources.			X
Discussion: Five historic properties (SIHP Nos. 50-80-12-4344, 4345, 4346, 4347, and 4348) were documented during Cultural Surveys Hawai'i's archaeological inventory survey of the Petition Area. All five historic properties have been assessed as eligible for the State Register of Historic Places under Criteria C and D, except for Site 4344, which is only eligible under criterion D. The State Historic Preservation Division (SHPD) concurs with these "significance" assessments. SHPD also concurs with the consulting archaeologist's (Cultural Surveys Hawai'i) mitigation recommendations, which include: (1) no further archaeological work at Site 4344, (2) preservation of Sites 4345, 4346, 4347, and 4348, and (3) archaeological monitoring in the vicinity of the four areas of historic habitation (Honouliuli taro lands, Kapalani Catholic Church, Pipeline Village, and Drivers/Stable Village). A preservation plan and archaeological monitoring plan will be prepared and submitted to SHPD for its review and approval.				
Objective C: To foster the visual and performing arts.				
Policy 1:	Encourage and support programs and activities for the visual and performing arts.			X
Policy 2:	Encourage creative expression and access to the arts by all segments of the population.			X
Policy 3:	Provide permanent art in appropriate City public buildings and places.			X
Discussion: This particular objective and accompanying policies are mostly directed to governmental agencies that support visual and performing arts.				
Objective D: To provide a wide range of recreational facilities and services that are readily available to all residents of Oahu.				
Policy 1:	Develop and maintain community-based parks to meet the needs of the different communities on Oahu.	X		
Policy 2:	Develop and maintain a system of regional parks and specialized recreation facilities.			X
Policy 3:	Develop and maintain urban parks, squares, and beautification areas in high-density urban places.	X		
Policy 4:	Encourage public and private botanic and zoological parks on Oahu to foster an awareness and appreciation of the natural environment.			X
Policy 5:	Encourage the State to develop and maintain a system of natural resource-based parks, such as beach, shoreline, and mountain parks.			X

AR00027257

City and County of Honolulu General Plan – Objectives and Policies		S	N/S	N/A
Policy 6:	Provide convenient access to all beaches and inland recreation areas.			X
Policy 7:	Provide for recreation programs which serve a broad spectrum of the population.			X
Policy 8:	Encourage ocean and water-oriented recreation activities that do not adversely impact on the natural environment.			X
Policy 9:	Require all new developments to provide their residents with adequate recreation space.	X		
Policy 10:	Encourage the private provision of recreation and leisure-time facilities and services.	X		
Policy 11:	Encourage the after-hours, weekend, and summertime use of public schools facilities for recreation.			X
Policy 12:	Provide for safe and secure use of public parks, beaches, and recreation facilities.			X
Policy 13:	Encourage the safe use of Oahu's ocean environments.			X
Policy 14:	Encourage the State and Federal governments to transfer excess and underutilized land to the City and County for public recreation use.			X
Discussion: The Ho'opili project includes approximately 210 acres for park and open space. The Petitioner proposes a series of parks and open spaces including a district park with active playfields, proposed to be located within the center of the Ho'opili project. In addition, a Canyon Park, located at the southeastern portion of the Ho'opili project, will provide a unique wilderness-type park alternative for residents. A Civic Plaza is envisioned as a community gathering space for outdoor concerts, farmer's markets, and other community events. The project has integrated an extensive network of open space and walking/biking paths. The City and County of Honolulu's Park Dedication Ordinance applies to all new residential developments and will mitigate the demand for recreational facilities.				
GOVERNMENT OPERATIONS AND FISCAL MANAGEMENT				
Objective A: To promote increased efficiency, effectiveness, and responsiveness in the provision of government services by the City and County of Honolulu.				
Policy 1:	Maintain City and County government services at the level necessary to be effective.			X
Policy 2:	Promote consolidation of State and City and County functions whenever more efficient and effective delivery of government programs and services can be achieved.			X
Policy 3:	Ensure that government attitudes, actions, and services are sensitive to community needs and concerns.			X
Policy 4:	Prepare, maintain, and publicize policies and plans which are adequate to guide and coordinate City programs and regulatory responsibilities.			X
Discussion: The above objective and policies related to fiscal integrity, responsibility, and efficiency by the City and County government in best directed to the City and County of Honolulu.				
Objective B: To ensure fiscal integrity, responsibility, and efficiency by the City and County government in carrying out its responsibilities.				
Policy 1:	Provide for a balanced budget.			X
Policy 2:	Allocate fiscal resources of the City and County to efficiently implement the policies of the General Plan and Development Plans.			X
Discussion: While the City and County of Honolulu's policies related to government operations and				

AR00027258

City and County of Honolulu General Plan – Objectives and Policies	S	N/S	N/A
fiscal management are not directly applicable to the Ho'opili project, the Petitioner supports the City and County of Honolulu's objectives. The project's most significant impact would be the higher real property taxes that would be generated compared to those currently paid. The Ho'opili project is projected to generate an additional $7.7 million in real property tax values in 2015, or $29.1 million on an annual basis upon the project's completion in 2030. These real property tax collections will continue after 2030.			

AR00027259

5.3.2 Ewa Development Plan

The *Ewa Development Plan* was updated and officially adopted by the City Council in August 1997 and is presently being updated. The plan presents a vision for 'Ewa's future development and provides conceptual land use plans that will serve as a policy guide for more detailed zoning maps and regulations, and public and private sector investment decisions. Provisions of the *Ewa Development Plan* are discussed in the table below.

Table 5.8. Ewa Development Plan – Objectives and Policies

Ewa Development Plan – Objectives and Policies	S	N/S	N/A
CHAPTER 1: EWA'S ROLE IN OAHU'S DEVELOPMENT PATTERN			
In support of the General Plan policies, the Ewa Development Plan:			
Provides a secondary employment center with its nucleus in the City of Kapolei to supplement the Primary Urban Center (PUC) and to divert commuter traffic from the PUC;	X		
Concentrates primary employment activities at industrial and resort areas and at government service and higher education centers around the City of Kapolei so that secondary markets are created for office and retail activities;	X		
Provides for significant residential development throughout Ewa, consistent with the General Plan to meet the needs of Oahu's citizens;	X		
Provides for a variety of housing types from affordable units and starter homes to mid-size multi-family and single-family units;	X		
Promotes diversified agriculture on prime agricultural lands along Kunia Road and surrounding the West Loch Naval Magazine in accordance with the General Plan policy to support agricultural diversification in all agricultural areas on O'ahu;			X
Provides a secondary resort area at West Beach (Ko Olina);			X
Helps relieve urban development pressures on rural and urban fringe Development Plan Areas (Waianae, North Shore, Koolau Loa, and Koolau Poko) so as to preserve the "country" lifestyle of these areas; and	X		
Provides, along with the PUC, a focus for directed and concentrated public and private infrastructure investment for growth.	X		
Discussion: The proposed project is a master-planned community ("East Kapolei") envisioned by the Ewa Development Plan. Ho'opili will be a mixed-use, transit-ready community including residential, business, and commercial areas; and transit stations, schools, and parks.			
CHAPTER 2: THE VISION FOR EWA'S FUTURE			
This vision for Ewa has two horizons. The first is a 25-year horizon, extending from the present (1995) to the year 2020. This is the horizon that was used to project likely socioeconomic change in Ewa and to assess the infrastructure and public facility needs that will have to be met over that period. The Vision to 2020. By 2020, the Ewa Development Plan Area will have experienced tremendous growth, and will have made significant progress toward providing a Secondary Urban Center for O'ahu. Population will have grown from 43,000 people in 1990 to almost 125,000. Nearly 28,000 new	X		

AR00027260

Ewa Development Plan – Objectives and Policies	S	N/S	N/A
housing units will have been built in a series of master planned communities. Job growth will be equally impressive, rising from 17,000 jobs to over 64,000 in 2020. Oahu residents and visitors will be attracted to Ewa by a new university campus, the Ko Olina resort, ocean and waterfront activities at Ewa Marina, a major super regional park, and a thriving City of Kapolei which has retail and commercial establishments and private and government offices. Beyond 2020. In the course of the Development Plan revision, it became clear that there was value in looking beyond 2020 to identify what Ewa should look like when "fully" developed. Such a perspective helped identify where open space should be preserved within the urbanized area, where the rapid transit corridor should be located, and where to set the limits to development in Ewa for the foreseeable future. As such, this second horizon might be called the built-out" horizon and is probably 40 or 50 years in the future.			

Discussion: The *Ewa Development Plan* establishes six key elements to ensure that the vision statement for the 'Ewa region is achieved. The following describes those key elements that are applicable to the proposed project (See Figure 2.5: Ewa Development Plan).

Urban Growth Boundary. Although the project site is within the Agricultural State Land Use District, it is located within (and makai of) the Urban Growth Boundary of the *Ewa Development Plan* Urban Land Use Map.

Network of Open Space and Greenways. The Ho'opili project is consistent with the Ewa DP's objectives and policies to protect and preserve open space. As many as 210 acres of parks and open space will be provided within the Petition Area. An additional 30 acres will be maintained as open space and will be used for off-site drainage. Open space buffers are proposed to be located along the H-1 Freeway and Old Fort Weaver Road. In addition, linear parks and open space will encircle the Ho'opili project with walking/biking paths to create a separate but welcoming identity for the Ho'opili community. The Petitioner consults with UHWO and DHHL on at least a monthly basis and is aware of DPP's requirements for street sections and planting strips (linear greenbelts) for the adjoining landowners and what precedents may have been established for Ho'opili. The Ho'opili project will be designed to facilitate multi-modal (transit, pedestrian, bicycle and automobile) connectivity between projects and to City and County of Honolulu streets and regional roadways (where permitted). Figure 2.8: Proposed Circulation Plan shows the approximate alignment of bikeways being proposed by DHHL, UHWO and the Petitioner and how they may connect to bikeways proposed by others (such as HCDA), the bike path shown along North-South Road on the Ewa DP Public Facilities Map, the bikeways shown on the State Bicycle Plan 2003 and the City and County of Honolulu's Draft Ewa Connectivity Study, future schools and park sites proposed by HCDA, DHHL, UHWO and the Petitioner, and possible transit stops (locations being finalized as of this writing). The placement of proposed future parks will consider the opportunities for potential co-location with elementary and middle schools.

The Secondary Urban Center. The Secondary Urban Center would function as the primary employment generator for the *Ewa Development Plan* area by the year 2020. Major new employment centers are planned at the City of Kapolei, Kapolei Hale (the Kapolei Civic Center completed in 2001), Ko 'Olina, the Deep Draft Harbor, Campbell Industrial Park, Barbers Point

AR00027261

Ewa Development Plan – Objectives and Policies	S	N/S	N/A

Naval Air Station (with civilian reuse) and the UHWO campus. While the greatest percentage of the developable area of the project is contemplated for residential use, the proposed project will generate employment opportunities during the construction period as well as after build-out. The project will include significant business and commercial areas that will provide employment opportunities. The proposed community will contribute to the larger goal of developing a "self-contained" second city within the greater master-planned Kapolei area in which residents can live, work, learn, play, and shop, and will complement the City of Kapolei and 'Ewa's urban core.

Communities Designed to Support Non-automotive Travel. According to the *Ewa Development Plan*, master-planned residential communities will be designed to support pedestrian, bicycle, and public transit uses. A rapid transit corridor along Farrington Highway and the proposed North-South Road will link the City of Kapolei, Villages of Kapolei, UHWO campus, and Waipahu. The proposed project will be built along the corridor, with large areas of the project site either within walking distance of transit stations or accessible by feeder buses. As a mixed-use, transit-ready community, Ho'opili will encourage residents to walk/bicycle to schools, parks, and business and commercial areas within the community, and use public transportation to commute to areas outside of the community.

Preservation and Enhancement of Cultural Resources. The *Ewa Development Plan* states:
Ewa's Historic and Cultural Resources will be preserved and enhanced by...retaining visual landmarks and significant vistas, including:

- *Distant views of the shoreline from the H-1 Freeway above the Ewa Plain;*
- *Views of the ocean from Farrington Highway between Kahe Point and the boundary of the Waianae Development Plan Area;*
- *Views of the Waianae Range from H-1 Freeway between Kunia Road and Kalo'i Gulch and from Kunia Road;*
- *Views of na puu at Kapolei, Palailai, and Makakilo;*
- *Mauka and makai views; and*
- *Views of central Honolulu and Diamond Head.*

Views of Diamond Head and the Ko'olau Mountain Range will be created from the property, which are currently inaccessible to the public. The visual appearance of the property will change from vacant scrub and cultivated vegetation to a master-planned community with approximately 210 acres of parks and open space. The project will be designed to take advantage of the views of Wai'anae, central Honolulu, and Diamond Head.

Phased Development. The *Ewa Development Plan* originally set forth a phasing program with the objective of coordinating future development with existing and planned infrastructure. It is our understanding that the proposed update to the *Ewa Development Plan* will remove references to phasing. Ho'opili is the final non-Urban land within the Urban Growth Boundary in 'Ewa. With the planned completion of the North-South Road in 2008, the development of UHWO, planning of a residential and commercial development by DHHL, the construction of the Kroc (recreational, social services and community) Center and the planned development by Hawaii Community Development Authority in Kalaeloa, the coordination of infrastructure with development is occurring through regular and frequent meetings between the Petitioner and DHHL, UHWO and HCDA. In addition, the Petitioner meets frequently with other State and County agencies, including the Department of Planning and Permitting, the Department of Transportation Services and the Department of Education.

CHAPTER 3: LAND USE POLICIES, PRINCIPLES, AND GUIDELINES

AR00027262

Ewa Development Plan – Objectives and Policies	S	N/S	N/A
3.1: OPEN SPACE PRESERVATION AND DEVELOPMENT — General Polices			
Open space will be used to:			
a) Provide long range protection for diversified agriculture on lands outside the Urban Growth Boundary,			X
b) Protect scenic views and provide recreation,	X		
c) Define the boundaries of communities,	X		
d) Provide a fire safety buffer where developed areas border "wildlands" either in preservation areas within the Urban Growth Boundary or in the State Conservation District, and			X
e) Create linkages between communities through a network of Greenways along transportation and utility corridors and drainageways.	X		
Discussion: Open space will be provided within the Petition Area to provide views and recreation, especially along the H-1 Freeway. Landscaping along linear parks with walking/biking paths will be installed to create a separate but welcoming identity for the Ho'opili community, as well as to define smaller neighborhoods. The Petitioner consults with UHWO and DHHL on at least a monthly basis and is aware of DPP's requirements for street sections and planting strips (linear greenbelts) for the adjoining landowners and what precedents may have been established for Ho'opili. The Ho'opili project will be designed to facilitate multi-modal (transit, pedestrian, bicycle and automobile) connectivity between projects and to City and County of Honolulu streets and regional roadways (where permitted). Figure 2.8: Proposed Circulation Plan shows the approximate alignment of bikeways being proposed by DHHL, UHWO and the Petitioner and how they may connect to bikeways proposed by others (such as HCDA), the bike path shown along North-South Road on the Ewa DP Public Facilities Map, the bikeways shown on the State Bicycle Plan 2003 and the City and County of Honolulu's Draft Ewa Connectivity Study, future schools and park sites proposed by HCDA, DHHL, UHWO and the Petitioner, and possible transit stops (locations being finalized as of this writing).			
3.2: REGIONAL PARKS AND RECREATION COMPLEXES — General Policies			
Regional parks and recreation complexes include the Kalaeloa Regional Park and Recreation Complex proposed for Barbers Point Naval Air Station, Kapolei Regional Park, Pu'u Palailai Park, various beach and shoreline parks, and public and private golf courses. To sustain economic, development, the City is encouraged to look towards public-private partnerships to build, and maintain new park and recreation complexes.			X
Regional Park. The new Kalaeloa Regional Park at the present Barbers Point Naval Air Station will feature a large shoreline park with beach recreation and support facilities; a wide range of activity areas including athletic fields in the mauka lands; and preserves for wildlife habitats, wetlands and endangered plant colonies. The Park will encompass mostly undeveloped lands, bordered by the shoreline on the south, the airfield and developed portions of the facility to the north and west, and the existing military golf course and future Ewa Marina golf course to the east.			X
Kapolei Regional Park is a 73-acre park which includes the Pu'u o Kapolei. The Park will serve as a defining limit for the northeastern edge of the City of Kapolei and as a visual gateway to the City. The park will provide diverse active and passive recreation within easy walking distance of both the City Center and the Villages of Kapolei.			X
Pu'u Palailai Park will be located below Makakilo, and is to be a nature park. It will offer hikers excellent views of the Ewa Plain and distant views of Honolulu and Diamond Head.			X
Two future beach parks are planned at both ends of Ko Olina. The larger			X

AR00027263

Ewa Development Plan – Objectives and Policies	S	N/S	N/A
park at the northern end of the resort will provide for picnicking and other passive recreation. A park at the southern end will provide direct access to one of the four swimming lagoons. A boat launching ramp, which will be available for public use, will be located adjacent to the southern park, and will provide access to the marina channel.			
Golf Courses. Ewa has seven public and private golf courses, and there are plans for five more. The City's courses include the West Loch and Ewa Villages golf courses. The Ewa Village course which will open in the spring of 1996 also provides flood protection and storm water detention for Ewa Villages.			X
Private golf courses include the Hawaii Prince, Puuloa, Kapolei, and Ko Olina golf courses. The U.S. military operates a golf course at Barbers Point Naval Air Station, (BPNAS) and will continue to do so after BPNAS is returned to civilian control. The Ewa-Gentry golf course is scheduled to begin construction 1997, and additional golf courses are planned for Ko Olina Resort, Makakilo, and Ewa Marina.			X
Golf courses can provide protection for open space, and help reduce flooding and non-point pollution by helping retain storm waters. Golf course development should be approved only after determination that the course meets social, growth, economic, and environmental guidelines and approval of a community integration program.			X
Recreation Complexes. Sports and recreation complexes designed to attract visitors from throughout the region and the rest of O'ahu have been proposed for a number of areas in Ewa. Proposals for a Kalaeloa Center on surplus lands at Barbers Point Naval Air Station call for creation of an "Olympic Village" type international training center, a baseball training facility, a rowing water course, a motorsports center, and a water theme park. Such complexes should be designed to be compatible with surrounding land uses and environmental features.			X
Discussion: While the Ewa DP's policies related to regional parks and recreation complexes are not directly applicable to the Ho'opili project, the Petitioner supports the plan's objectives. The Petitioner is proposing to set aside land for a district park near Fort Weaver Road to serve surrounding area residents.			
3.3: COMMUNITY-BASED PARKS — General Policies			
Adequate parks to meet residents' recreational needs should be provided. Currently, Ewa has less community-based park acreage than the Department of Parks and Recreation island-wide standard indicates is needed for its existing population. The existing deficit relative to the standard is almost 40 acres.	X		
New residential development should strive to provide land for open space and recreation purposes at a minimum of two acres of park per 1,000 residents. Community-based parks (and associated service radius) include mini-parks (1/4 mile), neighborhood parks (1/2 mile), community parks (one mile), and district parks (two miles).	X		
Based on these standards, an additional 76 acres of community-based parks and recreation areas should be developed to meet the needs of the projected 2020 Ewa population.	X		
Access to recreational resources in the mountains, at the shoreline, and in the ocean should be protected and expanded. New development projects are an opportunity to provide public access to trail heads from the streets extending toward the lf mountain slopes or approaching the edges of the	X		

AR00027264

Ewa Development Plan – Objectives and Policies	S	N/S	N/A
gulches. In addition, the City should support other efforts to expand access to mountain and gulch trails in areas where urban development will not occur.			
Development master plans should provide accessible pathways from surrounding streets to facilitate pedestrian and bicycle access to all features in parks.			
Discussion: While many of the future residents of Ho'opili will come from other areas of O'ahu, it is acknowledged that the recreational needs of the residents of Ho'opili must be met. Based on the *Ewa Development Plan* "requirement" of two acres of park per 1,000 residents, Ho'opili's proposed 11,750 units is expected to generate approximately 35,250 residents (at an average household size of 3 residents per household), resulting in a "requirement" of 70.5 acres of park. The Ho'opili project proposes a district park with active playfields, proposed to be located near Fort Weaver Road to serve surrounding area residents. In addition, a Canyon Park, located at the southeastern portion of the Ho'opili project, will provide a unique wilderness-type park alternative for residents. A Civic Plaza is envisioned as a community gathering space for outdoor concerts, farmer's markets, and other community events. "Mini" (neighborhood) parks located throughout the project will be within walking distance of most residences. The siting of parks will consider the potential opportunities for co-location of parks with elementary and middle school sites. The proposed project will include pedestrian and/or bicycle paths connecting streets and parks.			
3.4: HISTORIC AND CULTURAL RESOURCES — General Policies			
Physical references to Ewa's history and cultural roots should be emphasized to help define Ewa's unique sense of place. Existing visual landmarks should be protected, and creation of new culturally appropriate landmarks should be supported.	**X**		
Significant historic features from the plantation era and earlier periods should be preserved.	**X**		
Whenever possible, significant vistas should be retained.	**X**		
Discussion: Five historic properties (SIHP Nos. 50-80-12-4344, 4345, 4346, 4347, and 4348) were documented during Cultural Surveys Hawai'i's archaeological inventory survey of the Petition Area. All five historic properties have been assessed as eligible for the State Register of Historic Places under Criteria C and D, except for Site 4344, which is only eligible under criterion D. The State Historic Preservation Division (SHPD) concurs with these "significance" assessments. The SHPD also concurs with the consulting archaeologist's (Cultural Surveys Hawai'i) mitigation recommendations, which include: (1) no further archaeological work at Site 4344, (2) preservation of Sites 4345, 4346, 4347, and 4348, and (3) archaeological monitoring in the vicinity of the four areas of historic habitation (Honouliuli taro lands, Kapalani Catholic Church, Pipeline Village, and Drivers/Stable Village). A preservation plan and archaeological monitoring plan will be prepared and submitted to SHPD for its review and approval. The major visual resources in the vicinity of the Petition Area are the ocean and the Wai<u>'</u>anae and Ko'olau mountain ranges. The most heavily traveled roads in the vicinity of the project site are Fort Weaver Road and the H-1 Freeway. A vast majority of the project site is not visible from Fort Weaver Road, because it is set back and 30 to 40 feet higher than Fort Weaver Road. Since the Petition Area is west of Fort Weaver Road, development of the Petition Area will not obstruct views of the Ko'olau Mountains from either Fort Weaver (or the H-1 Freeway.) Development of the Petition Area will also not likely obstruct views of the Wai'anae Mountain range. There are presently no views towards the ocean from the portion of Fort Weaver Road between the H-1 Freeway and the Child and Family Services Complex (near the southeast corner of the Petition Area). There are occasional views towards the ocean and Diamond Head in the far distance across the project site from the high-speed H-1 Freeway. Development of the Petition Area may alter these views, but it should be noted that views of 'Ewa, in its present state, is not just of agricultural fields but also of a major electrical substation site, as well as 138kV lines mounted on tall metal poles. Also, the City			

AR00027265

Ewa Development Plan – Objectives and Policies	S	N/S	N/A
and County of Honolulu is proposing an elevated rail transit system as part of the HHCTC project through the project site and along North-South Road.			
3.5: CITY OF KAPOLEI — General Policies			
The City of Kapolei should serve as the urban core, or the 'downtown' for the Secondary Urban Center. It should accommodate a major share of the new employment in the Secondary Urban Center.	X		
The City of Kapolei should have a balanced mix of business and residential areas, complemented by the recreational, social and cultural activities of a city. Mixed use should be permitted and encouraged throughout most of the City area, in order to achieve the diversity and intensity of uses that characterize a city.	X		
The City of Kapolei is envisioned to be a true city, encompassing a full range of urban land uses, and laid out in small blocks connected by a grid system of public streets.			X
Discussion: The Ho'opili project is supportive of the Ewa DP's vision that the City of Kapolei should serve as the urban core, or the "downtown" for the Secondary Urban Center, with the main State and County governmental services located in the City of Kapolei and UHWO located in 'Ewa.			
3.6: RESIDENTIAL DEVELOPMENT — General Policies			
3.6.1: EWA VILLAGES			
The City and County of Honolulu has acquired the 600 acres surrounding and including Tenney, Renton and Varona Villages. The Master Plan for the Ewa Villages helps ensure continued tenancy and ownership opportunities for current residents as well as provides a vehicle for preservation efforts within the existing villages.			X
The existing village structures in the Ewa Villages should continue to be rehabilitated or adapted for reuse; and related affordable and market housing should be developed to create a total of 1,900 units, including the existing housing.			X
A City golf course has been recently developed to provide storage for storm waters. In addition, a district park, additional neighborhood parks/open space, and a small shopping center should be developed; and infrastructure improvements should be made.			X
Ewa Villages should once again stand as a thriving and identifiable community, and should serve as a living example of Hawaii's plantation heritage.			X
Discussion: While the Ewa DP's policies related to residential development of the 'Ewa Villages are not directly applicable to the Ho'opili project, the Petitioner supports the plan's objectives. The Petition Area abuts the 'Ewa Villages Golf Course.			
3.6.2: EWA MARINA			
Ewa Marina, when developed, should be the region's principal recreational marina destination for local residents and visitors. Developed on over 1,100 acres located between Ewa Beach and Kalaeloa (Barbers Point Naval Air Station), the community should be centered around a 120-acre marina which should serve as a major recreational resource and visual amenity for the community.			X
The marina should provide recreational boating opportunities, supported by 1,400 boat slips, marine haul-out and other repair facilities, and a public boat ramp.			X
The City supports timely development of the Ewa Marina as a key element needed to mitigate drainage impacts in the Kaloi Gulch watershed during major storms. The marina's role as a storm water storage and detention			X

AR00027266

Ewa Development Plan – Objectives and Policies	S	N/S	N/A
basin has been acknowledged and included in previously approved environmental impact statements and land use approvals for projects in the Kaloi gulch watershed.			
Ewa Marina should provide substantial public areas through shoreline and waterfront access, expansion of Oneula Beach Park, and creation of a District Park on Fort Weaver Road. The public waterfront promenade at Ewa Marina should have a hard edge and should focus on boating activity. Shoreline parks linked by pedestrian ways should be provided for public use along the entire waterway. A golf course should provide a major open space and visual amenity while also providing detention basins to receive run-off from light storms.			X
On the eastern end, the Ewa Marina community should consist of Low and Medium Density Residential neighborhoods extending westward from Ft. Weaver Road, encompassing the eastern "loop" of the marina and an island within the marina.			X
The existing community commercial center at Ewa Beach should be enlarged by development on land along Ft. Weaver Road at the eastern corner of the Ewa Marina community.			X
On the west, a mix of activities should be sited around the marina basin, including a Marina Mixed Use area with resort and commercial development, a High Density Residential area, and a Marine Industrial area. Ewa Marina is planned to have about 950 visitor units to support its marina-oriented activities.			X
Discussion: While the Ewa DP's policies related to the residential development of the 'Ewa Marina are not directly applicable to the Ho'opili project, the Petitioner supports the plan's objectives. While a relatively small portion of the Petition Area lies within the Kalo'i Gulch drainage basin, Ho'opili will be designed to detain future runoff from the site to current flows, until such time as the outlet to the ocean at 'Ewa Marina is opened. <u>During the Draft EIS public review period, HASEKO (Ewa), Inc. wrote: "...the location of the proposed ocean outlet is at One'ula Beach Park, and not at 'Ewa Marina (now known as Hoakalei Marina)...Because of the potential environmental problems associated with intersecting the Kalo'i Gulch regional drainage system with the Honouliuli sewer outfall pipe, the outlet has been relocated from the marina, which is to the west of the sewer outfall pipe, to the beach park, which lies east of the outfall." HASEKO (Ewa), Inc. also wrote: "The ability to construct the ocean outlet is dependent upon issuance of a conservation district use permit (CDUP) by the State Board of Land and Natural Resources. Haseko has applied for the CDUP, which is now being processed through a contested case proceeding."</u>			
3.6.3.1: EXISTING AND PLANNED RESIDENTIAL COMMUNITIES – General Policies			
The following general policies may be applied to the expansion or renovation of existing residential communities, as well as to new communities.			
Overall Density. To achieve the desired compactness and character of development in planned residential communities, the housing density of the aggregate area zoned for residential use (including the streets) should be in the range of 10 to 15 units per acre. (This average does not include areas zoned for commercial or industrial use.)	X		
Higher Density Housing Along the Transit Corridor. To promote use of mass transit, higher density residential use should be developed along a major rapid transit corridor linking Kapolei with Waipahu and Primary Urban Center communities to the east High Density Residential and Commercial uses should be developed at six transit nodes, which would cover a one quarter mile radius around major transit stops. Areas along the rapid transit corridor should have housing densities of 25 units per acre, and greater	X		

AR00027267

Ewa Development Plan – Objectives and Policies	S	N/S	N/A
densities are expected within the transit nodes.			
Physical Definition of Neighborhoods. The boundaries of neighborhoods should be made evident through the use of street patterns, landscape or natural features, and building form and siting. The focus of neighborhood activity should be on the local street or a common pedestrian right-of-way or recreation area.	X		
Compatible Mix of Building Forms. There should be a variety of housing types and densities to avoid visual monotony and accommodate a variety of housing needs, but without sharp contrasts between the exterior appearances of adjacent housing areas.	X		
Transit-Oriented Streets. Street patterns and rights-of-way should be designed to accommodate mass transit service and make it convenient to access for as many households as possible.	X		
Pedestrian and Bicycle Travel. Pedestrian and bicycle travel should be encouraged, particularly to reach neighborhood destinations such as schools, parks and convenience stores.	X		
Integration of Linear Corridors. Physical and visual connections between communities should be encouraged through the creative design of transportation and utility corridors and drainage systems.	X		
Provision of Community Facilities. Land should be provided for community facilities including churches, community centers, and elderly and child care centers.	X		

Discussion: The Ho'opili project will construct up to 11,750 residential units of varying product types. The Project will consist of for-sale single-family units and multi-family units, with multi-family rental units also available. The proposed project is envisioned as a new kind of development, one that improves the quality of people's lives by allowing them to live, work, learn, shop and play in their own community. As such, a network of open space and walking/biking paths will encircle the Ho'opili project. In keeping with the City and County of Honolulu's plans to place a high-capacity transit corridor within Ho'opili, two types of higher density housing are being proposed along the transit corridor: Mixed-Use/Medium Density Residential and Mixed-Use/High Density Residential.

Mixed-Use/Medium Density Residential

Planned to be oriented along future high-capacity transit and major roadway alignments, these medium density mixed use districts would include live-work residential units or residential uses over ground floor commercial and office uses. Within these districts that comprise approximately 340 acres (all of which will not be developed for housing because the acreage includes secondary roads, off-street parking and mini-"neighborhood" parks), there are approximately 5,200 dwelling units planned at densities of 15 to 29 units per acre along with retail and office use.

Mixed-Use/High Density Residential

Planned to be located near major transportation junctions, these higher density mixed use districts would include commercial, office space, and higher density live-work residential units or residential uses above ground floor businesses. Within these districts that comprise approximately 50 gross acres (which includes secondary roads, off-street parking and mini-"neighborhood" parks) would be approximately 40 net developable acres that would accommodate approximately 1,450 dwelling units planned at densities of 30 to 50 units per acre along with retail and office use.

The project will be designed to have transit-oriented streets, including transit boulevards with street sections including a high-capacity transit corridor right-of-way, as well as streets designed to accommodate bus transit. To enhance the convenience of both high-capacity transit as well as bus transit, the project will be designed to have a network of slower speed streets with sidewalks to

AR00027268

Ewa Development Plan – Objectives and Policies	S	N/S	N/A
encourage bicycle and pedestrian modes of travel. The Ho'opili project will be designed to facilitate multi-modal (automobile, bicycle and pedestrian) connectivity between projects and to City and County of Honolulu streets and regional roadways (where permitted). Figure 2.8: Proposed Circulation Plan shows the approximate alignment of is being proposed by DHHL, UHWO and the Petitioner and how they may connect to bikeways proposed by others (such as HCDA), the bike path shown along North-South Road on the Ewa DP Public Facilities Map, the bikeways shown on the State Bicycle Plan 2003 and the City and County of Honolulu's Draft Ewa Connectivity Study, future schools and park sites proposed by HCDA, DHHL, UHWO and the Petitioner, and possible transit stops (locations being finalized as of this writing).			
3.6.3.2: EXISTING AND PLANNED RESIDENTIAL COMMUNITIES- Guidelines – Low Density Residential			
Low Density Residential Low Density Residential areas consist of one and two-story single-family attached and/or detached dwellings with individual entries. **Density** • Density should be 5 to 12 units per acre, typical of residential zoning districts and allowing the application of optional design standards for Clusters and Planned Unit Developments. **Building Height** • In general, buildings should not exceed two stories, although the height may vary according to required flood elevation, slope, and roof form. **Site Design** • The site design for small-lot developments should avoid monotonous rows of garages and driveways along neighborhood street frontages by employing features such as varied building setbacks and shared driveways. **Building Form** • Buildings should provide visual interest and individual identity by using varied roof forms, exterior colors and finishes, building orientation, floor plans and architectural details.	X		
Discussion: Since nearly all of the above guidelines for Low Density Residential appear to be consistent with new urbanism principles, at the present time, it would appear the Petitioner would have little difficulty implementing nearly all of the above guidelines.			
3.6.3.2: EXISTING AND PLANNED RESIDENTIAL COMMUNITIES- Guidelines – Medium Density Residential			
Medium Density Residential Medium Density Residential areas consist of two- and three-story townhouse or low-rise apartment buildings. Dwelling units may have common entries, but buildings are typically non-elevator structures. **Density** • Density should be 10 to 30 units per acre. **Height** • In general, buildings should not exceed three stories above grade. Maximum building heights should allow for pitched roof forms. **Building Form** • Building form, orientation, location of entries and landscape screening should be employed to maintain a sense of residential scale and provide greater privacy and individual identity for housing units. **Compatibility** • Building scale, roof form and the quality of materials should be compatible with those of adjacent low-density residential areas.	X		
Discussion: Since nearly all of the above guidelines for Medium Density Residential appear to be			

AR00027269

Ewa Development Plan – Objectives and Policies	S	N/S	N/A
consistent with new urbanism principles, at the present time, it would appear the Petitioner would have little difficulty implementing nearly all of the above guidelines. It should be noted that some flexibility should be permitted to allow Medium Density Residential to be located in mixed-use zones, with the ground floor or lower floors occupied by retail and service commercial uses.			
3.6.3.2: EXISTING AND PLANNED RESIDENTIAL COMMUNITIES- Guidelines – High Density Residential			
High Density Residential High Density Residential developments take the form of multi-story apartment buildings. They may be located in mixed-use zones, with the ground floor or lower floors occupied by retail and service commercial uses. **Location** • In general, high-density residential buildings would be located in large planned residential communities, adjacent to major collector streets, commercial or civic centers. • High Density Residential is intended to be the predominant form of housing in and near the City of Kapolei and around transit nodes on the planned rapid transit corridor between Waipahu and Kapolei. **Density** • Allowable building density should accommodate 25 to 90 units per acre. **Height** • Building heights should not exceed 150 feet in the City of Kapolei and the Ko Olina Resort and 90 feet elsewhere. Taller building heights are intended to allow higher densities, create variation in the city-scape, [and] give a visual sign of transit nodes, and identify the City of Kapolei's importance as a regional center. **Architectural Character** • The building scale, roof form and the quality of materials may reflect a more urban character. **Height Setbacks** • Building height setbacks and landscaping should be employed to reduce the direct visibility of taller buildings from lower density residential areas and from the streetfront. Lower building elements may directly abut the streetfront.	X		
Discussion: Since nearly all of the above guidelines for High Density Residential appear to be consistent with new urbanism principles, at the present time, it would appear the Petitioner would have little difficulty implementing nearly all of the above guidelines.			
3.6.3.2: EXISTING AND PLANNED RESIDENTIAL COMMUNITIES- Guidelines – Circulation System			
Master-planned projects should each have a circulation plan, or "circulation element" in their Project Master Plan. **Transit Routes and Facilities** • The circulation plan should define the hierarchy of streets within the project and its relationship to the surrounding transportation network. • The circulation plan should also indicate existing and proposed bus routes and specific measures to accommodate efficient transit service for as many households as possible. • The rights-of-way along transit routes should make provisions for bus shelters, bus pull-outs, and, if applicable, park-and-ride facilities and/or future transit stations.	X		
Pedestrian and Bicycle Routes and Facilities • The circulation plan should indicate any principal pedestrian and bicycle paths that are physically separated from roadways. • Street intersections along these separated paths should have a narrow curb	X		

AR00027270

Ewa Development Plan – Objectives and Policies	S	N/S	N/A
radius and include special signage and paving to encourage safe and convenient pedestrian and bicycle crossings. • Interior pedestrian/bicycle routes may be provided as an alternative to paved sidewalks along local streets. • Most residences should be within a five-minute (or one-quarter mile) walking distance of a proposed bus route, unless localized topographic conditions make such a requirement impractical.			
Discussion: Prior to rezoning, a circulation plan defining the hierarchy of streets within the project and its relationship to the surrounding transportation network will be developed. The circulation plan will also indicate: - existing and proposed bus routes and specific measures to accommodate efficient transit service for as many households as possible; - any principal pedestrian and bicycle paths that are physically separated from roadways (and that interior pedestrian/bicycle routes may be provided as an alternative to paved sidewalks along local streets); - that street intersections along these separated paths should have a narrow curb radius and include special signage and paving to encourage safe and convenient pedestrian and bicycle crossings; - a five-minute walking radius from proposed bus and transit routes (unless localized topographic conditions make such a requirement impractical).			
3.7: NON RESIDENTIAL DEVELOPMENT — General Policies			
This section provides general policies, non-residential development, including planned commercial retail centers, Ko Olina Resort, industrial centers, Kalaeloa (Barbers Point Naval Air Station), Pearl Harbor Naval Base (West Loch), and the University of Hawaii West Oahu.			
3.7.1.1: PLANNED COMMERCIAL RETAIL CENTERS – General Policies			
Planned commercial centers, outside of the City of Kapolei, should provide retail shopping and services for the Ewa residential communities in which they are located. These centers differ from commercial areas within towns such as Waipahu or the City of Kapolei because they are typically managed as a unit with shared parking and center management.	X		
Commercial centers outside of the City of Kapolei should concentrate commercial uses in central locations instead of in continuous commercial strips along arterial roads. Pedestrian and transit access to and within the centers should be emphasized. **Definitions.** Four types of commercial centers can be defined based on size and function: • **Neighborhood Commercial Center** (5-10 acres or less, typically located within or adjacent to residential area, up to 100,000 square feet [sq. ft.] of floor area); • **Community Commercial Center** (10-30 acres, typically located on an arterial highway or at the intersection of two major collector streets, up to 250,000 sq. ft. of floor area); • **Major Community Commercial Center** (up to 50 acres, located in communities which are not near an urban center, up to 500,000 sq. ft. of floor area); and • **Regional Commercial Center** (more than 50 acres, located with frontage on	X		

AR00027271

Ewa Development Plan – Objectives and Policies	S	N/S	N/A
a major arterial highway and access from freeway interchange, more than 500,000 sq. ft. of floor area). No Major Community Commercial Centers or Regional Commercial Centers are indicated for Ewa outside of the City of Kapolei since the City of Kapolei is intended to provide for regional shopping needs. **Neighborhood Commercial Center.** Neighborhood Commercial Centers can be located within any residential community, and should be reviewed and approved as part of development of master planned residential communities or redevelopment of existing communities. Neighborhood Commercial Centers have frontage on at least one collector street, and may have up to 100,000 sq. ft. of floor area, which is leased to tenants such as grocery stores, sundries stores and other services and shops catering to common household needs. Single commercial establishments, such as convenience stores or "Mom and Pop" stores, or groupings of stores smaller than five acres in size also fall within this category, provided that they are appropriately located and will not contribute to the evolution of a commercial strip. **Community Commercial Center.** This type of center principally serves the community in which it is located, providing for basic shopping and service needs on a larger scale than the neighborhood center. Community Commercial Centers may contain up to 250,000 sq.ft. of floor area, and major attractions typically include a large grocery store, a drug store, and/or a department store. The other, smaller tenants in the center are largely dependent on the effectiveness of the major tenants to draw customers. The Kapolei Shopping Center is an example of this type of commercial center. Locations for existing and planned Community Commercial Centers at Ewa Beach, Laulani, Kapolei East (near the intersection of Farrington Highway and the North-South Road), Villages of Kapolei, Makaiwa Hills and Ko Olina Marina are shown on the Urban Land Use Map in Appendix A. Office uses should not be a principal use in Ewa Community Commercial Centers. Offices which provide services to the local community may be included in the centers, but the emphasis should be on retail uses. In Ewa, developments primarily oriented to office uses should be located in the City of Kapolei.			
Discussion: The Ho'opili project plans to provide approximately 235 gross acres (which includes secondary roads and off-street parking) for business/commercial uses. As a predominately mixed-use development, the proposed retail commercial uses would be best fall in the Ewa DP-described as "Neighborhood Commercial Centers" or "Community Commercial Centers." It should be noted that some flexibility should be permitted to allow Community Commercial Centers to include office use as a principal use, especially around transit stations, including the half-mile transit-influence zones. In order to minimize work-related commuter traffic and the characterization of 'Ewa as a bedroom community of Honolulu, the Petitioner feels that allowing office use as a principal use in 'Ewa Community Commercial Centers will help Ho'opili in its goal to achieve a job-housing balance (and thus balance the work-related traffic from Ewa towards the Central Business District in the morning (and vice-versa in the afternoon). These areas could be significant employment generators for Ho'opili and the region. In addition, these commercial/business uses will be located conveniently near the major transportation corridors of the region, and will designed to promote bus, high-			

AR00027272

Ewa Development Plan – Objectives and Policies	S	N/S	N/A
capacity transit, and pedestrian and bicycle access.			
3.7.1.2: PLANNED COMMERCIAL RETAIL CENTERS – Planning Principles			
Planning principles for retail centers vary according to the size of the commercial center and the purpose it serves. The following planning principles apply to Neighborhood and Community Commercial Centers:			
• **Mix of Uses.** Planned commercial centers should be dedicated primarily to retail uses and to office uses that provide services to the surrounding community. Residential uses may also be incorporated in such commercial centers.	X		
• **Appropriate Scale.** The building mass of a commercial center should be in keeping with its urban and natural setting,	X		
• **Compatible Style.** The architectural character of commercial centers should respect the surrounding urban and natural features, particularly when located adjacent to a residential area or significant natural or historic feature. Neighborhood commercial centers should reflect a residential architectural character.	X		
• **Accessibility.** Commercial centers should incorporate site design and facilities to promote pedestrian, bicycle and transit access. Pedestrian and bicycle access is more important for smaller, neighborhood centers, while transit access is more significant for community centers. These planning principles should be applied to the expansion or renovation of existing commercial centers, as well as to new centers.	X		
Discussion: The Ho'opili project plans to include "Neighborhood Commercial Centers" and "Community Commercial Centers" as defined in the Ewa DP. As suggested in the Ewa DP's "Planning Principles" for "Planned Commercial Retail Centers," the planned commercial centers are planned to enhance a mixed use of development where residents can work and shop within walking distance of their homes. So for instance in areas where bus and high-capacity transit is easily accessible, there may be ground floor retail, office space on the second and third stories and residential use above that. However, it is possible that future office uses may provide services to a greater geographical area than the immediate surrounding community. An extreme example would be an internet-based company that provides website design for clients outside of 'Ewa. In less densely developed areas there would be accommodation for more parking and the massing may be more appropriate to low-rise residential development. However, in areas where there is elevated rail transit, there may be ground floor retail, retail at the transit station level, office space in between both levels of retail, as well as office space above (the transit station level) and residential use above that. The architectural character of a particular street block within the Ho'opili project would differ according to it location within the site, its surrounding uses and its proximity to both bus and transit stations. It is agreed that the overall architectural character of the commercial centers should be compatible with the surrounding neighborhoods, but there is a possibility that differing design characters may be established for each neighborhood. The entire Ho'opili project will be designed to promote pedestrian and bicycle access, as well as transit access, where available.			
3.7.1.3: PLANNED COMMERCIAL RETAIL CENTERS – Guidelines			
Neighborhood Commercial Centers **Architectural Character** • The architectural character should respect adjacent residential uses. • Gable and hip-form roofs are encouraged, using breaks in the roof line to	X		

AR00027273

Ewa Development Plan – Objectives and Policies	S	N/S	N/A
reduce the apparent scale of large roof plates. • Residential character may also be expressed by using exterior materials and colors that are typically found in neighborhood houses. **Building Siting** • Buildings should be oriented to the pedestrian. • Storefronts should face the street and, to the extent possible, be sited close to the sidewalk. • Parking and service areas should be placed behind the buildings or otherwise visually screened from streets and residential areas. **Building Height and Density** • Buildings should maintain a residential scale. • Building height limits should allow for gable and hip-form roof elements. • The total floor area for a lot or contiguous lots with common parking should not exceed 100,000 sq. ft. **Vehicular Access** • Access to the parking and loading areas should be from a collector street. • Access to a local residential street may be permitted if it is only for emergency or secondary access and would not encourage through traffic along the local street. **Pedestrian and Bicycle Facilities** • There should be at least one pedestrian access from the public sidewalk or other off-site pedestrian pathway to the entrances of establishments in the commercial center that does not require crossing a traffic lane or parking lot aisle or driveway. • Bicycle racks should be designed to provide security and be visible from the street entry. **Visual Screening, Lighting & Signage** • Parking and service areas should be screened from the street and adjacent residential lots by planting a landscape screen of trees and hedges along street frontages and property lines and planting shade trees throughout the parking lot. • Only low-level or indirect lighting, if any, should be used in parking lots. • All signage should be unilluminated or indirectly illuminated.			
Community Commercial Centers **Architectural Character** • The architectural character may be varied, depending on the context. • Commercial center buildings that are visible from adjacent residential areas should reflect a residential character; other facades may have a character more typical of a commercial building. • The design should avoid disruptive contrasts between facades that are visible simultaneously from public areas. **Building Bulk and Massing** • When the building is adjacent to a residential area or a building of historic value, there should be a transition in scale from larger building elements of the commercial center to finer elements near the adjacent use. • Portions of buildings visible from a street should avoid blank facades by using texture, articulation, color and fenestration to create visual interest. • Facades that are close to the public right-of-way should be composed of display windows and pedestrian entrances. **Building Height and Density** • Building heights should generally not exceed 45 feet.	X		

AR00027274

Ewa Development Plan – Objectives and Policies	S	N/S	N/A
• The total floor area should not exceed 250,000 sq. ft. for a standard Community Commercial Center. **Pedestrian, Bicycle and Transit Facilities** • Street frontage improvements for bus stops, including a bus shelter and a pull-out off a traffic lane, should be provided along all abutting streets which have bus routes. • There should be a pedestrian pathway from the bus stop to an entrance to the main building of the commercial center. The pathway should be clearly indicated with special paving or markings and covered to provide weather protection, if the commercial center building is not directly connected to the bus shelter. • Bicycle racks should be designed to provide security and be visible from the street entry to the commercial center. **Visual Screening** • The visibility of parking and service areas from the street and adjacent residential areas should be minimized through screening. • A landscape screen, consisting of trees and hedges, should be planted along the street fronting the parking lot or garage. • If there is a parking lot, shade trees should be planted throughout. • If there is a parking garage close to and readily visible from a street, landscape planters should be provided along the facade of each parking level fronting the street. • Service areas should be visually screened from public and residential areas. **Signage** • Signage visible from residential areas should be indirectly illuminated.			
Discussion: Since nearly all of the above guidelines for Neighborhood Commercial Centers appear to be consistent with new urbanism principles, at the present time, it would appear the Petitioner would have little difficulty implementing nearly all of the above guidelines (for Neighborhood Commercial Centers). It should be noted that some flexibility should be allowed for roof forms, in the event that adjacent residential or other uses utilize roof forms that are different, or in order to achieve greater energy efficiency. At the present time, it is not envisioned that there will be a Neighborhood Commercial Center with a total floor area for a lot or contiguous lot with common parking exceeding 100,000 square feet, but over the 25± years that this project may be built out, it is possible that a major employer may decide to locate in a predominately residential area, to allow its employees opportunities to live near their place of employment. Since nearly all of the above guidelines for Community Commercial Centers appear to be consistent with new urbanism principles, at the present time, it would appear the Petitioner would have little difficulty implementing nearly all of the above guidelines (for Community Commercial Centers). It should be noted that some definition of what are "disruptive contrasts between facades" should be given, as there are many older neighborhoods in Hawai'i, where say, a single building with Asian-style architecture stands out against other more consistent forms of architecture, but yet is reflective of one or more cultures that make up Hawai'i.			
3.7.2: KO OLINA RESORT			
Ko Olina Resort is designated in the General Plan as one of four "secondary" resort destinations which are part of an overall strategy to relieve growth pressure on Waikiki.			X
The resort, which is located on 640 acres between Kahe Point Beach Park and the Barbers Point Deep Draft Harbor, should be an integral part of the Secondary Urban Center.			X
When developed, Ko Olina Resort should be a water-oriented residential and			X

AR00027275

Ewa Development Plan – Objectives and Policies	S	N/S	N/A
resort community with about 4,000 visitor units in hotels and resort condominiums and 8,700 residential units in Phase I and II. Ko Olina is master-planned to incorporate recreational features in addition to visitor accommodations. Recreational facilities include two golf courses, a small boat marina, and four man-made swimming lagoons. Development for the first golf course and the swimming lagoons, and installation of roads and utilities are completed. Development of the second golf course will occur in Phase II. The first hotel opened in 1993 with almost 400 rooms.			
As it develops, Ko Olina should provide substantial waterfront areas for public use. The entire shoreline should be natural open space, softened by landscaping, and should focus on the beach and swimming lagoons			X
Discussion: The Ewa DP's policies related to the Ko 'Olina Resort are not directly applicable to the Ho'opili project.			
3.7.3: INDUSTRIAL CENTERS – GENERAL POLICIES			
Barbers Point Industrial Area			
Industrial centers in Ewa include the Barbers Point Industrial Area and Honouliuli Industrial Area. Industrial activity should also be permitted at other dispersed industrial areas, as noted below.			X
As an alternative to industrial uses, a commercial, cultural or recreational entertainment attraction may be permitted in the area fronting the OR&L Historic Railway, provided that the use is designed to enhance the viability of the operation of the railway for historic theme rides, strengthen the linkage between the Ko Olina Resort and the City of Kapolei and proceed with a strong community based planning process.			X
Barbers Point Industrial Area includes Campbell Industrial Park, Barbers Point Deep Draft Harbor, Kenai Industrial Park, and Kapolei Business Park. It should continue to grow as one of O'ahu and the State's most important industrial areas. It is the site of the States largest heavy industrial area (Campbell Industrial Park) and an important industrial harbor and fuel transfer point.			X
The future industrial and transportation uses of Barbers Point Naval Air Station (BPNAS) will be determined by the Barbers Point Redevelopment Commission. The northern parts of Kapolei Business Park and any BPNAS lands designated for industrial use should provide for light industrial uses as a transition between heavy industry at Campbell Industrial Park and the City of Kapolei.			X
An additional electrical power generating plant could be constructed at the Barbers Point Industrial Area, possibly taking advantage of cogeneration opportunities with other industrial activities. The 138 kilovolt transmission corridor running from the Barbers Point Industrial Area to Waiau could accommodate additional load on the existing poles.			X
Honouliuli Industrial Area			
Honouliuli should remain a smaller industrial area, used primarily for wastewater treatment. It includes 13 acres of land in the 'Ewa by Gentry project which is designated for light industrial use. A power generation facility may be included if it is dependent on wastewater treatment operations and can be designed so that it is generally not visible from nearby major public rights-of-way, residential areas, and commercial areas.			X
The Honouliuli Wastewater Treatment Plant should be expanded to accommodate additional growth in the region as well as to provide additional facilities for higher levels of wastewater treatment The City should acquire an additional 60 acres to accomplish this.	X		
Other Industrial Areas			

AR00027276

Ewa Development Plan – Objectives and Policies	S	N/S	N/A
Service-oriented industrial uses should be allowed throughout the region as noted below. Uses requiring larger lots should be located in Campbell Industrial Park Small lot uses including automobile repair shops contractor's yards, and businesses serving residential and commercial areas should be allowed to locate near the City of Kapolei in the Kapolei Business Park and on any industrial lands which may be designated within Barbers Point Naval Air Station.	X		
The **Hawaiian Electric Company generating plant** in Kahe Valley should remain the largest source of electrical power on Oahu The plant could be expanded which would take advantage of available land area, cooling system capacity and power transmission lines.			X
The **industrial area planned for the western edge of Ewa Marina** should accommodate marine haul-out facilities, repair shops, and related small boat industrial uses.			X
Discussion: The Ewa DP's policies related to the Barbers Point Industrial Area are not directly applicable to the Ho'opili project. The Ho'opili project will generate additional flow that must be treated at the Honouliuli WWTP. To mitigate the additional burden, the project will participate in the Wastewater System Facility Charge (WSFC) program and contribute funds (based on building permits) to expand the treatment plant. The Ho'opili project proposes to provide approximately 50 gross acres (which includes secondary roads and off-street parking) for larger light industrial and business mixed use. It is estimated that there would be a net development area of approximately 40 acres industrial mixed-use.			
3.7.3.2: INDUSTRIAL CENTERS – PLANNING PRINCIPLES			
The general policies for industrial centers are supported by the following planning principles: • **Appropriate Scale.** The visibility of large building volumes and tall building or machinery elements from resort areas, residential areas, commercial and civic districts, and parks should be minimized through site planning and landscaping. • **Environmental Compatibility.** Industries and utilities that discharge air or water pollutants, even when treated, should be located in areas where they would impose the least potential harm on the natural environment in case the treatment process fails to perform adequately. Uses that generate high noise levels should be located and operated in a way that will keep noise to an acceptable level in existing and planned residential areas. The building setback from the shoreline should be a minimum of 60 feet in the Ewa coastal area, as recommended in the Oahu Shoreline Study (1989), and 150 feet where possible.	X		
Discussion: Development within the proposed light industrial and business mixed use areas within the Petition Area will guided by design controls to ensure the scale of development is compatible with surrounding areas and visual impacts will be kept to a minimum. No noxious uses or uses that generate constant high noise levels would be considered compatible with this predominately mixed-use community. The Petition Area is well beyond 150 feet from the shoreline.			
3.7.4: KALAELOA (BARBERS POINT NAVAL AIR STATION)			
Development of a major new regional public park, and provision of continuous lateral public access along the shoreline are priority reuse options for the BPNAS Local Reuse Plan.			X
A continuous pedestrian route along the entire Ewa coast should be created. The entire shoreline of the BPNAS should be reserved for public access and recreation after military use of BPNAS ceases.			X
In addition, building setbacks from the shoreline should be required, a lateral public access easement along the Campbell Industrial Park shoreline should be			X

AR00027277

Ewa Development Plan – Objectives and Policies	S	N/S	N/A
acquired, and public shoreline pathways should be established at Ko Olina and Ewa Marina.			
The road network should be integrated with the regional circulation system.			X
There should be ample lands devoted to uses that will create long term jobs for Ewa's residents.			X
Discussion: While the Ewa DP's policies related to the development of Kalaeloa are not directly applicable to the Ho'opili project, the Petitioner supports the plan's objectives.			
3.7.5: PEARL HARBOR NAVAL BASE (WEST LOCH)			
The West Loch Branch of Naval Magazine Lualualei will be the principal site where U.S. Department of Defense ordnance handling and storage for Oahu will be consolidated. The existing Explosives Safety Zone at West Loch will remain, but will not need to be enlarged.			X
The City should request expansion of limited public access to the shoreline waters of West Loch beyond the West Loch Shoreline Park and should support retaining and enhancing wetland areas along the Pearl Harbor shoreline.			X
Discussion: While the Ewa DP's policies related to the non residential development of the Pearl Harbor Naval Base are not directly applicable to the Ho'opili project, the Petitioner supports the plan's objectives. While the Petitioner acknowledges the importance of the Pearl Harbor Naval Base to the nation's security, it is hopeful that the Navy will allow an easement over a small portion of its lands between the proposed project's makai-most drainage detention basin and West Loch of Pearl Harbor. With respect to the West Loch drainage basin, the project intends to collect all storm water and route it to the existing detention basin located on the east side of Fort Weaver Road and south of the OR&L railroad tracks. The routing would require the installation of a concrete channel from the southeastern end of Parcel C, under Fort Weaver Road (using the existing cane haul underpass) and connecting to the existing detention basin. The basin would be expanded to ensure that the water quality storage component of the City and County of Honolulu Standards was achieved. An overflow from the detention basin would discharge to the West Loch of Pearl Harbor (See Parcel D2 on Figure 1.5: Parcels Map). The portion of the project within the West Loch drainage basin is the bulk of Parcel C. The overflow from the detention basin would have to cross Navy property. Permission of the Navy would be required. Initial inquiries have been made to the Navy to see if the overflow can be negotiated. Issues with the Navy include security and access in a post- "9/11" environment, Navy plans for development in the overflow corridor, and the acquisition of a maintenance commitment by the City and County of Honolulu. The concept of the overflow across Navy property is not new and was approved in concept back in the early- to mid- 1990's. Lack of action and the issues cited above are points that need to be resolved for the overflow option to move forward. If permitted, the overflow option across Navy property will solve drainage problems occurring on Fort Weaver Road, within West Loch Estates and within portions of 'Ewa Villages by effectively collecting the storm water that currently is misdirected across these properties. The current Navy position with respect to use of the Navy's land for drainage purposes is that the land is not available for use and the project should pursue "other available options." The alternative available is to expand the project's on-site detention system to retain all increased run-off generated in the West Loch drainage basin.			
3.7.6: UNIVERSITY OF HAWAII WEST OAHU			
The campus should evoke a unique sense of place that distinguishes it as an important civic and cultural institution in Ewa. Project size is 2,800 students by			X

AR00027278

Ewa Development Plan – Objectives and Policies	S	N/S	N/A
the end of construction (which is to begin no later than the end of December 2011) and 7,600 students by 2020. The projected 2020 faculty and staff are 800.			
The campus should be oriented to support pedestrian access to and transit usage from a major transit node located on the North-South Road. The development of the University of Hawaii West Oahu campus should include plans to provide shuttle bus service to the transit node at the corner of Farrington Highway and the proposed North-South Road. The campus should be designed so that open space areas can be used for flood detention and retention as part of the Kaloi Gulch watershed master plan.			X
Discussion: While the Ewa DP's policies related to the UH West O'ahu campus are not directly applicable to the Ho'opili project, the Petitioner supports the development of UH West O'ahu. The UH West O'ahu will enable Ho'opili residents to obtain post-secondary degrees without commuting to the UH Mānoa campus or other higher education institutions in Honolulu.			
CHAPTER 4: PUBLIC FACILITIES AND INFRASTRUCTURE POLICIES AND PRINCIPLES			
4.1.6: TRANSPORTATION SYSTEMS — General Policies			
The following general transportation systems policies support the vision for development of Ewa.			
Adequate Access and Services. Before zoning approval is given for new residential and commercial development in Ewa, the Department of Transportation Services should either: (I) indicate that adequate transportation access and services can be provided with existing facilities and systems, or (2) recommend conditions that should be included as part of the zone change approval in order to assure adequacy,			X
Discussion: The above policy is directly addressed to the Department of Transportation Services, however, the Petitioner has been coordinating with DTS regarding the methodology for preparing the traffic impact assessment report, the long-planned widening of Farrington Highway and the HHCTC project, among other issues.			
Transportation System Functions. To support Ewa's role as the site for the Secondary Urban Center and a major growth area for new residential and employment development, its transportation system should:			
• Provide adequate access between residences and jobs, shopping, and recreation centers in Ewa as development occurs;	X		
• Provide improved access to and from adjacent areas, especially Central Oahu; and			X
• Provide adequate capacity for major peak-hour commuting to work in the Primary Urban Center. (Although the share of residents who will both live and work in Ewa is projected to increase from 17% to 44% by 2020, a majority of residents will still commute to jobs outside the region.)	X		
Discussion: Ho'opili is being designed to maximize connectivity within and to/from surrounding properties. Most of the site is relatively flat, which will enhance its accessibility by pedestrians and bicyclists. A fine grid of closely-spaced blocks is envisioned over most of the site and where topography allows. In addition, the project will be designed to ~~embrace~~ support both enhanced bus transit and high-capacity transit. Finally, it is proposed that a mix of land uses be distributed throughout the site, creating several "complete" neighborhoods, where residents can work, shop, play and study, all within walking distance of a park and/or transit stop. The Ho'opili project has been planned assuming that certain planned transportation projects will be constructed including a portion of North-South Road between Farrington Highway and Kapolei Parkway; a portion of the North-South Road and a new H-1 Freeway interchange; a portion of the intersection of North-South Road and Farrington Highway; the long-planned widening of Farrington Highway fronting the Petition Area; the proposed East-West Connector Road through the Petition			

AR00027279

Ewa Development Plan – Objectives and Policies	S	N/S	N/A
Area; and the segment of the proposed HHCTC mass-transit project through the Petition Area. However, ultimately, the goal of the Secondary Urban Center is to achieve a job/housing balance within Ewa so that residents would not have to commute to jobs outside the region. 'Ewa's proposed land uses will more likely to allow the Secondary Urban Center to achieve such a job/housing balance than the newer communities in Central Oahu, which is primarily residential in nature.			
Improved Linkages. Additional routes, as noted in Section 4.1.3 of this Plan, should be created between the various parts of the region, including to and across BPNAS after it is returned to civilian control.	**X**		
Discussion: Besides long-planned roads such the widening of Farrington Highway, Kapolei Parkway and the North-South Road, recently proposed roads include: 1) the East-West Connector Road (connecting Farrington Highway, UHWO, North-South Road, DHHL East Kapolei Development Parcel 2, Ho'opili and Fort Weaver Road); 2) the extension of North-South Road in a makai direction through Kalaeloa (formerly "BPNAS") into Ocean Pointe and eventually Ewa Beach; and 3) widening Roosevelt Avenue. The Petitioner is supportive of the above additional routes and is planning to accommodate the portion of the East-West Connector Road through the project site.			
Reduction in Automobile Use. Reliance on the private passenger vehicle should be reduced by:			
• Provision of circulation systems with separated pedestrian and bicycle paths and convenient routes for public transit service,	**X**		
• Use of more traditional "grid" patterns for street systems in new development areas to facilitate bus routes and encourage pedestrian travel,	**X**		
• Provision of supporting facilities and amenities for pedestrian, bicycle, and public transit use. The use of bike trails, bicycle racks at commercial centers, bicycle storage facilities at employment centers as well as bus shelters at bus stops will be encouraged.	**X**		
• Acquisition of a dedicated rapid transit right-of-way prior to development, and support for high-density and high-traffic land uses along the rapid-transit corridor, especially within a quarter-mile of centers of the transit nodes, subject to City Council approval of any system.	**X**		
Discussion: Ho'opili is being designed to maximize connectivity within and to/from surrounding properties. Most of the site is relatively flat, which will enhance its accessibility by pedestrians and bicyclists. The Kapolei Area Bikeway Plan (KABP), published by James Campbell Company LLC in 1991, establishes a comprehensive bikeway network to serve the 'Ewa Plain. Bike paths within the project will be designed to encourage residents to bicycle between their homes and work, school, social, recreational and commercial areas. As currently planned, the project will be designed to include various types of bikeways, including: grade-separated bicycle/pedestrian paths; and lower-speed roads suitable for experienced bicyclists. The Petitioner has coordinated with both UHWO and DHHL to develop a regional network of bikeways that facilitates connectivity between projects and that as a network connects to the bikeway system proposed by the Kapolei Area Bikeway Plan (See Figure 2.8: Proposed Circulation Plan). A fine grid of closely-spaced blocks is envisioned over most of the site and where topography allows. In addition, the project will be designed to ~~embrace~~ support both enhanced bus transit and high-capacity transit. The Petitioner acknowledges that supporting facilities and amenities for pedestrian, bicycle, and public transit use will facilitate and encourage walking, biking and using transit, and reduce the need to accommodate personal automobiles, unnecessarily wide roads, parking, et cetera. The Petitioner will plan for bike trails, bicycle racks at commercial centers, bicycle storage facilities at employment centers as well as bus shelters at bus stops. Ho'opili is being designed to be transit-ready, and the land use plan, while subject to change, has			

AR00027280

Ewa Development Plan – Objectives and Policies	S	N/S	N/A
been designed to accommodate a high-capacity transit corridor either along Farrington Highway or diagonally through the project site, with either one or two transit station locations. While the proposed residential unit count will not change, the land use plan will need to be adjusted depending on the final alignment of the high-capacity transit corridor, as the potential for noise impact from an elevated high-capacity transit alignment would likely require taller, higher density residential or industrial uses along the alignment. The final siting of the transit station location(s) will also provide transit-oriented development potentials, which will also cause the plan to be refined, as higher intensity development (and density) will probably be concentrated around the transit station(s). Also possible is a transit maintenance and storage facility.			
4.1.7: TRANSPORTATION SYSTEMS — Planning Principles			
Because of its generally even, gradually sloping terrain, Ewa offers decided advantages for transportation.			
• It provides an opportunity to create multiple linkages and routes between the various parts of the region. This advantage is enhanced by the planned closing of the Barbers Point Naval Air Station, which will return the area to civilian use and thereby allow for increased road linkages to and across former Naval Air Station lands.	X		
• The terrain allows for relatively less expensive development of a dedicated transit right-of-way. The flat terrain also increases the feasibility of constructing a rapid transit system on that right-of-way.	X		
• Both the terrain and the sunny, low rainfall climate enhance bicycling as an alternative form of transportation as well as for recreation. An improved environment for bicycling and walking also improves the potential for high transit ridership. (See the discussion of the Kapolei Area Bikeway Plan above in Sec. 4.1.5.)	X		
Discussion: Ho'opili is being designed to maximize connectivity within and to/from surrounding properties. Most of the site is relatively flat, which will enhance its accessibility by pedestrians and bicyclists. The Kapolei Area Bikeway Plan (KABP), published by James Campbell Company LLC in 1991, establishes a comprehensive bikeway network to serve the 'Ewa Plain. Bike paths within the project will be designed to encourage residents to bicycle between their homes and work, school, social, recreational and commercial areas. As currently planned, the project will be designed to include various types of bikeways, including: grade-separated bicycle/pedestrian paths; and lower-speed roads suitable for experienced bicyclists. The Petitioner has coordinated with both UHWO and DHHL to develop a regional network of bikeways that facilitates connectivity between projects and that as a network connects to the bikeway system proposed by the Kapolei Area Bikeway Plan (See Figure 2.8: Proposed Circulation Plan). Besides long-planned roads that would connect various parts of the region, such the widening of Farrington Highway, Kapolei Parkway and the North-South Road, recently proposed roads include: 1) the East-West Connector (connecting Farrington Highway, UHWO, North-South Road, DHHL East Kapolei Development Parcel 2, Ho'opili and Fort Weaver Road); 2) the extension of North-South Road in a makai direction through Kalaeloa (formerly "BPNAS") into Ocean Pointe and eventually Ewa Beach; and 3) widening Roosevelt Avenue. The Petitioner is supportive of the above additional routes and is planning to accommodate the portion of East West Connector through Ho'opili. For the most part, as the Petition Area is relatively flat (except at Honouliuli Gulch) and open (cultivated fields), it allows for relatively less expensive development of a high-capacity transit corridor. Since the area has a relatively dry climate and most of the Petition Area is relatively flat it makes Ho'opili conducive to bicycling for transportation to the adjoining UHWO and other nearby			

AR00027281

Ewa Development Plan – Objectives and Policies	S	N/S	N/A
destinations, as well as for recreation. It is acknowledged that enhancing the opportunities for bicycling and walking will help to extend the reach and influence of transit ridership.			
Planning principles and guidelines addressing residential and commercial land uses, set forth in Chapter 3, Sections 3. 6 and 3.7 above, provide substantial guidance toward enhancing pedestrian, bicycle and transit modes of transportation. The following principles should guide the development of a multi-modal transportation system for Ewa:			
• **Comprehensive Roadway Network.** The roadway system should be designed to provide multiple routes for traveling among the various residential communities and activity centers of Ewa, thereby lending variety to travel within the region and promoting communication among its communities. Network designs for communities should take on more of a grid pattern, increasing intersections between collector streets. The design should also increase connections between parallel major collectors and arterials - e.g., between North-South Road and Fort Weaver Road - rather than relying primarily upon loop roads to feed the major roadways. Planning for East Kapolei and for the reuse of Barbers Point Naval Air Station are important opportunities for creating such connections.	X		
• **Land Use Planning Anticipating Rapid Transit.** Key to the vision for Ewa is reservation of a rapid transit corridor prior to development and the planning of high-density and high-traffic land uses along the corridor. This strategy will contribute to the feasibility of developing a high-speed transit line and will result in a more mobile, less automobile-dependent community. Planning for all the communities along the proposed transit corridor on Farrington Highway, North-South Road, and Kapolei Parkway should reflect the desire to establish a rapid transit corridor with high density residential and commercial nodes located at regular intervals.	X		
• **Transit-Oriented Community Street Systems.** Circulation systems within residential communities and commercial centers should emphasize connections between north-south and east-west streets and accessibility from residential streets to bus routes, parks, schools and commercial centers. Circulation systems should be designed to facilitate bicycle and pedestrian travel, to increase transit use, and to reduce dependence on automobile travel. See Chapter 3, Sections 3.6 and 3.7, for more detailed planning principles and guidelines for circulation in residential communities and commercial centers.	X		
• **Community-Level Street Standards.** Standards for public streets within residential communities and commercial centers should be revised to support and improve pedestrian and bicycle travel and on-street parking. While average motor vehicle speed may be reduced, safety and enjoyability for pedestrians and bicyclists would be increased, and greater efficiency in land use, reduced constructions costs, and improved street function may occur.	X		
Discussion: A discussion regarding the multi-modal transportation system in Ho'opili is described below:			

AR00027282

Ewa Development Plan – Objectives and Policies	S	N/S	N/A
Comprehensive Roadway Network. Ho'opili is being designed to maximize connectivity within and to/from surrounding properties. To provide multiple routes for traveling through Ho'opili, a fine grid of closely-spaced blocks is envisioned over most of the site and where topography allows. Major planned and proposed regional connectors have been considered in the planning of the proposed project. These include: setting aside additional right-of-way for the City and County of Honolulu's widening of Farrington Highway; multiple connections to Farrington Highway; setting aside land for the proposed East-West Road; connection to the proposed North-South Road (under construction); and construction of a mauka-makai "North-South Bypass" road. **Land Use Planning Anticipating Rapid Transit.** Ho'opili is being designed to be transit-ready, and the land use plan, while subject to change, has been designed to accommodate a high-capacity transit corridor either along Farrington Highway or diagonally through the project site, with either one or two transit station locations. While the proposed residential unit count will not change, the land use plan will need to be adjusted depending on the final alignment of the high-capacity transit corridor, as the potential for noise impact from an elevated high-capacity transit alignment would likely require taller, higher density residential or industrial uses along the alignment. The final siting of the transit station location(s) will also provide transit-oriented development potentials, which will also cause the plan to be refined, as higher intensity development (and density) will probably be concentrated around the transit station(s). **Transit-Oriented Community Street Systems.** The Ho'opili transportation gridded circulation system is envisioned to emphasize connections between north-south and east-west streets and accessibility from residential (and residential mixed-use) streets to bus (and high-capacity transit) routes, parks, schools and business/commercial centers. The circulation systems will be designed to facilitate bicycle and pedestrian travel, to enhance the desirability of transit use, and to reduce dependence on automobile travel. **Community-Level Street Standards.** Within the proposed fine network of gridded streets, it is envisioned that most streets will include on-street parking and sidewalks and/or grade-separated multi-modal bike/pedestrian paths. This will allow experienced bicyclists to travel on most roadways and inexperienced bicyclists to stay off roads, except at intersections.			
4.2.1: WATER ALLOCATION AND SYSTEM DEVELOPMENT — General Policies			
The following general policies should be followed in developing Ewa potable and nonpotable water systems to meet the projected demand.			
Adequacy of Water Supply. Before zoning approval is given for new residential or commercial development in Ewa, the Board of Water Supply should either indicate that adequate potable and nonpotable water is available or recommend conditions that should be included as part of the zone change approval in order to assure adequacy.	**X**		
Dual Transmission Lines. Where required, developments should have dual water lines to allow conservation of potable water and use of nonpotable water for irrigation and other appropriate uses. Such requirements shall be determined during review of project master plans for new developments and approval of zoning applications.	**X**		
Development and Allocation of Potable Water. The State Commission on Water Resource Management has final authority in all matters regarding administration of the State Water Code. Under that authority, the Board of Water Supply should coordinate development of potable water sources and allocation of all potable water intended for urban use on Oahu. State and private well development projects could then be integrated into and made consistent with City water			**X**

AR00027283

Ewa Development Plan – Objectives and Policies	S	N/S	N/A
source development plans.			
Use of Nonpotable Water. An adequate supply of nonpotable water should be developed for irrigation and other suitable uses on the Ewa Plain in order to conserve the supply of potable water and to take advantage of dual water systems constructed by Ewa developers. The Pearl Harbor aquifer is the most cost effective and accessible water resource of potable quality, and it is needed to support the existing and future domestic potable water uses described in the development plans. To minimize the risk of impacts to our precious potable water sources, the use of reclaimed water ('reclaimed wastewater effluent") and brackish waters as nonpotable irrigation sources in the coastal caprock area such as the Ewa Plain should be given high priority. Significant demand exists for nonpotable water for golf courses, landscape irrigation and industrial uses on the Ewa Plain. In addition to the compatibility of the source to the demand in the area, the infrastructure to distribute the reclaimed water in that area is being planned. Use of reclaimed water and brackish water should, therefore, focus on meeting demand in the Ewa Plain where there are no adverse consequences to the drinking water resources. Experiences with increasing chloride, nitrate and pesticide contamination of groundwater indicate that activities on the surface of the land can have a detrimental effect on the quality of drinking water. Nonpotable water used above Pearl Harbor aquifer should be low in total dissolved solids to protect the quality of drinking water withdrawn from wells located down-gradient of the application.	X		
Use of Waiahole Ditch Water. A sufficient amount of water is needed to meet the diversified agricultural needs for Ewa and Central Oahu along with high quality recharge of the Pearl Harbor aquifer. A number of potential sources are identified in Table 4.2, including: caprock, surface water, spring waters, Waiahole Ditch Water and wastewater effluent, The amount of water available and the potential use of each of these sources varies according to location. The State Commission on Water Resource Management should consider all sources of water in making allocations.			X
Water Reclamation. The City will reclaim and distribute wastewater effluent, provided that paying customers can be found for the nonpotable water. No additional costs will be borne by sewer users to subsidize private users of recycled effluent. Under the City's agreement through a Consent Decree with the U.S. Environmental Protection Agency and the State Department of Health, the City plans to reclaim and use up to 10 mgd of Oahu's wastewater by 2001. Construction of the secondary treatment unit at the Honouliuli Wastewater Treatment Plant has been completed. The facility is capable of providing 13 million gallons per day (mgd) of undisinfected secondary treated reclaimed water (R-3 quality). In Fiscal Year 1997-98, the City plans to build a pilot project at Honouliuli to study the potential for aquifer recharge with disinfected secondary treated reclaimed water (R-2 quality) and to evaluate the resulting water quality impacts within the lower Ewa plain region. The R-3 secondary treatment facility at	X		

AR00027284

Ewa Development Plan – Objectives and Policies	S	N/S	N/A
Honouliuli will be upgraded to an R-2 facility when the pilot project is ready to begin. The pilot project will have a capacity of 5 106 mgd. If the pilot project indicates the water quality of the Ewa caprock aquifer can be improved with effluent recharge with no detrimental impacts to near shore waters, the pilot project will be expanded to provide 13 mgd of recharge, providing that customers can be found to pay for the capital costs of the distribution system and the cost of operating and maintaining the facility and distribution system.			
Integrated Resource Management. Management of all potable and nonpotable water sources, including ground water, stream water, storm water, and effluent reuse should be integrated through amendments to the Oahu Water Management Plan and future Integrated Resource Management plans which will require Council approval and adequate public review, following City development of plans and adoption of an appropriate management process.			**X**

Discussion:

Adequacy of Water Supply. As requested by the Board of Water Supply in their comments on the EISPN, a Conceptual Water Master Plan addressing potable and non-potable water facilities has been prepared and reproduced in its entirety and attached to this EIS as Appendix M ~~will be submitted to~~ for BWS ~~for its~~ review and approval.

Dual Transmission Lines. With respect to non-potable water requirements, the project will be maximizing non-drinking usage to minimize the demand on the safe drinking water system. If a suitable supply is made available, ~~S~~street right of ways of the Ho'opili project will have underground non-drinking distribution systems. The project will be maximizing the use of non-potable water for irrigation to minimize the impact on the source component of the BWS system. It is proposed that the project's greenbelts, parks and roadway medians use non-potable water for irrigation, if a suitable supply will be available. The BWS Water Resources Division will be contacted regarding the availability of recycled water and other non-potable water supplies. A Conceptual Water Master Plan addressing safe drinking and non-potable water facilities has been prepared and reproduced in its entirety and attached to this EIS as Appendix M ~~will be submitted to~~ for BWS ~~for its~~ review and approval. In addition, construction drawings will be submitted to BWS for its review and approval. During the public review period of the Draft EIS, the DLNR Commission on Water Resource Management requested that "the reuse of storm water and installation of water efficient fixtures be considered" and recommended "the use of xeriscaping and the planting of drought tolerant and salt-tolerant plans to conserve water supplies."

Use of Nonpotable Water. It is proposed to upgrade the existing non-drinking source (EP 5 & 6 located within Parcel C) to a BWS dedicable standard to be used as the source for the non-drinking system. It is also proposed to ultimately allow for future dedication of the non-drinking system. It is estimated that the ultimate non-drinking demand for the project will be approximately 2.1 MGD.

Water Reclamation. Another source of non-potable water is reclaimed water. The Honolulu Board of Water Supply (BWS) entered into the water recycling business in 2000 by purchasing the Honouliuli Water Reclamation Facility. Water recycling of treated wastewater effluent is one element of a broader BWS strategy to protect O'ahu's aquifers and to conserve water resources through conservation and development of new water supplies. Treated effluent from the facility is now irrigating golf courses that were once using brackish water, including West Loch, 'Ewa Villages, Hawai'i Prince, and Coral Creek. The facility is also providing recycled water (at a different level of treatment) to industries at Campbell Industrial Park.

AR00027285

Ewa Development Plan – Objectives and Policies	S	N/S	N/A
The project will be maximizing the use of non-potable water for irrigation to minimize the impact on the source component of the BWS system. It is proposed that the project's greenbelts, parks and roadway medians use non-potable water for irrigation, if a suitable supply will be available. The BWS Water Resources Division will be contacted regarding the availability of recycled water and other non-potable water supplies. A Conceptual Water Master Plan addressing safe drinking and non-potable water facilities has been prepared and reproduced in its entirety and attached to this EIS as Appendix M ~~will be submitted to~~ for BWS ~~for its~~ review and approval. In addition, construction drawings will be submitted to BWS for its review and approval. During the public review period of the Draft EIS, the DLNR Commission on Water Resource Management requested that "the reuse of storm water and installation of water efficient fixtures be considered" and recommended "the use of xeriscaping and the planting of drought tolerant and salt-tolerant plans to conserve water supplies."			
4.3.1 WASTEWATER TREATMENT – General Policies			
All wastewater produced by new developments in Ewa should be connected to a regional or municipal sewer service system.	X		
Where feasible, effluent should be treated and used as a source of nonpotable water for irrigation and other uses below the Underground Injection Control line of the State Department of Health and the "No-Pass' Line of the Board of Water Supply. As noted above, the Department of Environmental Services has made a commitment to the U.S. Environmental Protection Agency and the State Department of Health to reclaim and use up to 10 million gallons a day (mgd) of wastewater islandwide by 2001.	X		
Wastewater treatment plants should generally be located in areas shown as planned for industrial use and away from residential areas shown on the Urban Land Use Map in Appendix A. Existing treatment plants are shown on the Urban Land Use Map and the Public Facilities Map in Appendix A. A City review and approval process, such as the Plan Review Use process, which provides adequate public notice and input, complete technical analysis of the project, and approval by the City Council, shall be required for any major new private wastewater treatment plant. Other system elements, such as pump stations and mains, should not require such comprehensive review and policy approval.			X
Discussion: Within the 'Ewa area, sewage is treated by the City and County of Honolulu's Honouliuli Wastewater Treatment Facility (WWTF). The treatment facility is located at the corner of North Hanson Road and Geiger Road, approximately 7,200 feet (1.4 miles) south of Parcel C. The Petition Area is upwind of the Honouliuli WWTF during predominant tradewind conditions. The nearest existing sewer collection system to the Petition Area is the Makakilo Interceptor/Kapolei Interceptor system located along the OR&L railroad tracks. The Department of Hawaiian Homelands (DHHL) is currently extending a collection system component from the Makakilo/Kapolei collection in a northerly direction up the North-South Road alignment to serve its land holdings in the area. The component (42-inch sewer) has been oversized to accommodate the Ho'opili project as well as the University of Hawai'i West O'ahu (UHWO) campus. Based on average daily flows, the facility has a primary treatment capacity of 38 million gallons per day (MGD), with future plans to expand to 51 MGD. The primary means of disposal is through a deep ocean outfall with a design capacity of 112 MGD. The facility was recently upgraded (with the Honouliuli Water Reclamation Facility) to produce 10 MGD of R-1 quality effluent, which is suitable for irrigation reuse. The Petitioner plans to install a dual transmission system with separate lines for drinking and non-potable water. While one potential source of non-potable water is brackish water wells, another possible source is R-1 quality effluent from the Honouliuli WRF.			
4.4.1 ELECTRICAL POWER DEVELOPMENT – General Policies			

AR00027286

Ewa Development Plan – Objectives and Policies	S	N/S	N/A
Major system improvements -- such as development of a new power generating plant and/or major new transmission lines -. should be analyzed and approved based on islandwide studies and siting evaluations. Strong consideration should be given to placing any new transmission lines underground.			X
Electrical power plants should generally be located in areas shown as planned for Industrial use and away from Residential areas shown on the Urban Land Use Map in Appendix A. Existing power plants are shown on the Urban Land Use Map and Public Facilities Map in Appendix A. Any proposed major new electrical power plant or proposals for a new above-ground or underground transmission corridor carrying voltages of ~~I 38kV~~ 138kV or greater shall be considered through a City review and approval process, such as the Plan Review Use process, which provides public review, complete analysis, and approval from the Department of Land Utilization and the City Council.			X
Other system elements, such as sub-stations and transmission lines, are not shown on the Map and should be reviewed and approved administratively.	X		
Discussion: Electricity for the Petition Area is provided by Hawaiian Electric Company (HECO), which has an available generation capacity (peak demand) of approximately 1,687 megawatts (Gross MW). According to the HECO website, HECO "is looking for companies to supply enough biofuel -- either ethanol or biodiesel -- to fuel HECO's new Campbell Industrial Park Generating Station planned to be in service by mid-2009. HECO reached an agreement with the State Consumer Advocate, subject to approval by the State Public Utilities Commission, to fuel this new 110-megawatt* peaking plant with 100-percent, renewable biofuel." HECO's transmission lines in the area include 138 kV lines mounted on tall metal poles from across the H-1 Freeway, across a portion of Parcel B, along Farrington Highway and then in the makai direction along the proposed North-South Road corridor. Within Ho'opili, electrical transmission lines will be placed underground. Preliminary discussions with HECO indicate that up to three substations will need to be sited within the Petition Area.			
4.5.1 SOLID WASTE HANDLING AND DISPOSAL – General Policies			
The East Kapolei site identified in the SWIM Plan should not be developed as a landfill, It is in an area planned for residential use and is adjacent to the University of Hawaii West Oahu campus,			X
Siting and/or expansion of sanitary landfills should be analyzed and approved based on islandwide studies and siting evaluations,			X
Discussion: The above policy is outside of the purview of the Petitioner and probably intended for the Department of Environmental Services.			
4.6.1: DRAINAGE SYSTEMS — General Policies			
Drainage system design should emphasize control and minimization of non-point source pollution and the retention and/or detention of storm water on-site and in appropriate open space and wetland areas.	X		
Storm water should be viewed as a potential irregular source of water for recharge of the aquifer which should be retained for absorption rather than quickly moved to coastal waters.	X		
Natural and man-made vegetated drainageways and retention basins should be the preferred solution to drainage problems wherever they could promote water recharge, help control non-point source pollutants, and provide passive recreation benefits.	X		
Discussion: The project will increase impervious surfaces such as roadways, roofs, paved parking areas, and sidewalks. These surfaces will cause an increase in storm water discharge within the Petition Area. However, detention basins and/or retention basins are being planned and sited to detain and/or retain storm water to ensure that areas downstream of the project are not impacted.			

AR00027287

Ewa Development Plan – Objectives and Policies	S	N/S	N/A
Surface water quality can be impacted through development. The project will be providing detention basins to meet City and County of Honolulu Standards for water quality treatment.			
4.6.2: DRAINAGE SYSTEMS — Planning Principles			
Principles to guide the development of Ewa drainage systems include:			
• **Retention and Detention.** Public and private agencies should employ methods of retaining or detaining storm water for gradual release into the ground as the preferred strategy for management of storm water. Where feasible, any open space, including parking lots, landscaped areas, mini and community parks, and public and private golf courses should be used to detain or infiltrate storm water flows to reduce their volume and runoff rates and the amounts of sediments and pollutants transported.	X		
• **Relation to the Regional Open Space Network.** To the extent possible, the developers should integrate planned improvements to the drainage system into the regional open space network by emphasizing the use of retention basins, creation of passive recreational areas, and recreational access for pedestrians and bicycles. Natural gulches on the slopes of the Waianae Range foothills which are within the Urban Growth Boundary should be preserved as part of the open space network.	X		
Discussion: The project will increase impervious surfaces such as roadways, roofs, paved parking areas, and sidewalks. These surfaces will cause an increase in storm water discharge within the Petition Area. However, detention basins and/or retention basins are being planned and sited to detain and/or retain storm water to ensure that areas downstream of the project are not impacted. Surface water quality can be impacted through development. The project will be providing detention basins to meet City and County of Honolulu Standards for water quality treatment. Honouliuli Gulch will be linked to the regional open space network and bicycle (and pedestrian) circulation system. While most of the Petition Area is on a plateau, part of the site next to Honouliuli Village is below a cliff of the plateau. Part of the cliff has eroded and formed a "canyon" (min-valley). As part of the master plan for the Petition Area, a Canyon Park is proposed, which would be located at the southeastern portion of the Ho'opili project. This park would provide a unique wilderness-type park alternative for residents, and would part of Ho'opili's open space network.			
The following principles apply specifically to development within the Kaloi Gulch drainage basin,			
• **Key Role of Ewa Marina.** The City supports timely development of the Ewa Marina as a key element needed to mitigate drainage impacts in the Kaloi Gulch watershed during major storms, The marina's role as a storm water storage and detention basin has been acknowledged and included in previously approved environmental impact statements and land use approvals for projects in the Kaloi Gulch watershed.	X		
• **Relation to the Ewa Village Master Plan and Other Previously Approved Developments in the Basin.** Solutions to handling drainage problems on lands above Ewa Villages must be compatible with the drainage design of the Ewa Villages Master Plan and other developments in the Kaloi Gulch drainage basin which have already been approved. The Ewa Villages drainage design assumes that runoff will not exceed existing levels received from sugar cane fields north of the golf course, will enter the Ewa Villages	X		

AR00027288

Ewa Development Plan – Objectives and Policies	S	N/S	N/A
golf course water retention areas through a number of dispersed channels, and will not be at velocities which would scour out the golf course water retention areas.			
Discussion: While a relatively small portion of the Petition Area lies within the Kalo'i Gulch drainage basin, Ho'opili will be designed to detain future runoff from the site to current flows before entering Kalo'i Gulch, until such time as the outlet to the ocean at 'Ewa Marina is opened. During the Draft EIS public review period, HASEKO (Ewa), Inc. wrote: "...the location of the proposed ocean outlet is at One'ula Beach Park, and not at 'Ewa Marina (now known as Hoakalei Marina)...Because of the potential environmental problems associated with intersecting the Kalo'i Gulch regional drainage system with the Honouliuli sewer outfall pipe, the outlet has been relocated from the marina, which is to the west of the sewer outfall pipe, to the beach park, which lies east of the outfall." HASEKO (Ewa), Inc. also wrote: "The ability to construct the ocean outlet is dependent upon issuance of a conservation district use permit (CDUP) by the State Board of Land and Natural Resources. Haseko has applied for the CDUP, which is now being processed through a contested case proceeding."			
4.7.1: SCHOOL FACILITIES — General Policies			
The State Department of Education should review and recommend on the adequacy of school facilities, either at existing schools or at new school sites to be made available when the development is completed.	**X**		
Developers should pay their fair share of all costs needed to insure provision of adequate school facilities for the children living in their developments.	**X**		
Discussion: The Petitioner has been coordinating with the Department of Education (DOE) over a number of years to determine the number, type and location of schools to serve the future residents of Ho'opili. The proposed project could include as many as five public school sites. The project could provide approximately 90 acres for Department of Education (DOE) school sites. Currently, three elementary schools, one middle school, and one high school are sited on the Conceptual Land Use Plan. The Petitioner intends to pay its fair share contribution. In addition, the Petitioner has initiated discussions with existing private schools whether they would be interested in opening campuses within Ho'opili. The current conceptual land use plan includes one potential location for a private school site.			
4.7.2: SCHOOL FACILITIES — Planning Principles			
The following principles should be followed in planning and operating schools in Ewa:			
• **Schools as Community Centers.** Because of the difficult financial problems for all sectors, new communities are likely to have fewer churches, private social halls, and recreation facilities. As a result, schools may have to assume important functions as cultural and recreational centers and as meeting facilities. The State DOE should design school facilities to facilitate community use during non-school hours and weekends.			**X**
• **Co-location with Parks.** Elementary and intermediate schools should be co-located with neighborhood or community parks, and designs of facilities should be coordinated by the State DOE and the Department of Parks and Recreation when needless duplication of parking and of athletic, recreation, and meeting facilities can be avoided.	**X**		
• **Shared Facilities.** The Department of Parks and Recreation should coordinate the development and use of athletic facilities such as swimming pools and gymnasiums with the DOE where such facilities would maximize use and reduce duplication of function.			**X**
• **Fair Share Contribution.** The City will support the State Department of Education's request for fair share contributions from developers of residential projects to insure that adequate school facilities are in place at existing and new schools to meet the needs of residents.	**X**		

AR00027289

Ewa Development Plan – Objectives and Policies	S	N/S	N/A
Discussion: The Petitioner agrees that future school cafetoriums can serve as community centers and can play in role in building neighborhoods. The Petitioner also concurs that elementary and middle schools should be co-located with parks. The Petitioner intends to pay its fair share contribution.			
4.8.1: PUBLIC SAFETY FACILITIES — General Policies			
Adequate staffing and facilities are needed to ensure public safety. New development should be approved only if staffing and facilities will be adequate to provide fire and police protection when development is completed.	X		
Discussion: The Honolulu Fire and Police Departments are being consulted early in the planning process (including during this EIS). To date, no major issues of concerns have been raised by either department. The project will comply with all Honolulu Fire Department requirements for access, water supply, and building construction. In addition, the Petitioner is proposing a public facility site immediately mauka of Farrington Highway near the western portion of Parcel B for a use such as a fire station, EMS site and/or police substation.			
4.9 OTHER COMMUNITY FACILITIES			
Other existing and proposed community facilities shown on the Urban Land Use Map in Appendix A include hospitals, colleges, correctional facilities, and cemeteries. Key facilities include the planned University of Hawaii West Oahu campus and St. Francis West Hospital. Location of new community facilities should comply with the following principles:			
• Colleges and Hospitals. Colleges and hospitals should generally be located in urban areas near transit nodes, commercial centers, or high-density residential areas.			X
• Correctional Facilities. Correctional facilities should generally be located on industrial or agricultural lands. (However, a youth detention facility can be located within the City of Kapolei as part of a relocated Family Court.) If such a facility is proposed for lands not planned for industrial or agricultural use, a City review and approval process which provides public review, complete analysis, and policy approval should be used.			X
• Other Major Facilities. Major public, quasi-public or private facilities or utilities which provide essential community services but which could have a major adverse impact on surrounding land uses should be considered through a City review and approval process, such as the Plan Review Use process, which provides public notification, review by appropriate agencies, opportunities for public comment, and approval by the City Council.			X
Discussion: While the *Ewa Development Plan's* policies related to other community facilities are not directly applicable to the Ho'opili project, the Petitioner concurs that any major public, quasi-public or private facilities or utilities which provide essential community services but which could have a major adverse impact on surrounding land uses should be considered through a City review and approval process, such as the Plan Review Use process, which provides public notification, review by appropriate agencies, opportunities for public comment, and approval by the City Council.			
4.10 ADDED OR CHANGED PUBLIC FACILITIES			
Public facilities other than those listed in this plan shall be identified on the Public Infrastructure Map.	X		
Discussion: The Public Facilities Map shows a future intermediate school site and a future district park site in the vicinity of the Ho'opili project site. The proposed project could include as many as five public school sites, depending on further discussions with the State Department of Education. As presently planned, the project includes accommodations for public facilities on six sites on a total of 100 acres. These sites could accommodate three elementary schools, one middle school, one high school and an additional public facilities space. It is currently proposed that a site be set aside for a district park adjacent to a proposed middle school site near the intersection of Old Fort Weaver Road and Fort Weaver Road. The district park site could serve the residents of Ho'opili and the			

AR00027290

Ewa Development Plan – Objectives and Policies	S	N/S	N/A
surrounding area. The number of public facilities proposed within the project site exceeds the requirements of the *Ewa Development Plan*.			
CHAPTER 5: IMPLEMENTATION			
5.4.2: PROJECT MASTER PLANS			
The Project Master Plan is intended solely as a guide to help describe in words and illustrations how a project promotes the vision, policies, principles and guidelines for Ewa. Projects associated with a significant zone change which involve 25 acres or more shall include a Project Master Plan to the Department of Planning & Permitting. The Project Master Plan shall cover all project phases. It shall be reviewed to determine whether the project supports the vision, policies, principles, and guidelines of the Ewa Development Plan. In the event a Final EIS has already been accepted by the City and County of Honolulu for a particular project, then a subsequent Project Master Plan will not be required. The Project Master Plan should be based on the best information available to the applicant at the time the Change of Zone Application is submitted to the City and County of Honolulu.	X		
Discussion: A Draft Project Master Plan is attached to this EIS as Appendix Q. As the alignment of the HHCTC project has not been finalized within the Petition Area, it is premature to identify the desired zoning for the proposed project. The Draft Project Master Plan is based on the best information available to date.			

CONSISTENCY WITH THE VISION FOR 'EWA

'Ewa will continue to experience tremendous growth, and has made significant progress toward providing a new, or secondary urban center for O'ahu. The population has nearly doubled since 1990 and is expected to double again by 2030. Job growth should be equally impressive with another 40,000 jobs expected to be created by 2025. O'ahu residents and visitors should be attracted to 'Ewa by a new university campus, new resort, new small boat marina and waterfront activities, the growth of Ko 'Olina, and the City of Kapolei bustling with retail and commercial establishments and private and government offices. 'Ewa will be built around a regional system of open space and greenways so that it has the feel of a network of communities "within a garden."

Ho'opili is highly consistent with the goals and objectives of two primary recognized long-range development plans for the area, the City and County of Honolulu's directed growth policy for the area, the *Ewa Development Plan* (Ewa DP) and the *Kapolei Area Long Range Master Plan* (See Figure 3.4: Kapolei Area Long Range Master Plan), which was adopted by the City and County of Honolulu as part of Resolution 91-34. The Ewa DP states that growth in the area will include community building, not just project development, with communities designed to enhance lives, reduce automobile dependency, and be connected via a network of greenways.

AR00027291

Ho'opili fundamentally adheres to the best intentions of the area's long-range master plans and the possibilities for a better 'Ewa with its:

- concentrated mixed-use development pattern;
- ~~embrace~~ support of "Traditional Neighborhood Design" and "Transit-Oriented Development" principles so that the entire project is walkable, connected and transit-ready;
- commitment to contributing to a strong jobs-housing balance within the greater Kapolei area;
- earmarking of large areas for community gathering places, schools, parks and open space and a comprehensive bicycle/pedestrian network; and
- A density of approximately 11,750 homes that should provide many housing opportunities within the affordable and market-rate price ranges.

Ho'opili continues to be highly coordinated with major planning and development efforts by other regional developers, including the Department of Hawaiian Home Lands, the Hawaii Community Development Authority and University of Hawai'i at West O'ahu. Meetings among regional developers as well as County and State agencies have been held on a regular and frequent basis to discuss shared infrastructure improvements, timing and connectivity. As a result, joint development agreements have already been entered into between the area's developers and the City and County of Honolulu regarding regional sewer transmission line improvements, with more to follow.

Ho'opili can play a key role in actualizing the community's vision for 'Ewa and enhancing the desirability of living on the 'Ewa Plain. Ho'opili, or "coming together," is part of the bridge where Honolulu's existing central corridor that reaches to Waipahu meets the urban core of the 'Ewa Plain, the City of Kapolei. It is where neighboring towns from Waipahu to Ko 'Olina and from Makakilo to 'Ewa Beach will be welcome and can gather.

Residents should celebrate the benefits of this connected community for generations to come. Ho'opili is a community that is:

- Going to enhance living in 'Ewa: more time spent with families, fewer vehicle trips and cleaner air quality, and greater community gathering opportunities;
- Highly livable with a range of housing options – including affordable, workforce, and senior housing – plus parks, community facilities, schools, with a diversity of jobs and retail options;
- Sustainable, "green" requiring fewer car trips with its bicycle and pedestrian paths;
- Innovative, incorporating principles of "Traditional Neighborhood Design," and "transit-oriented development"; and
- Based on a healthy, live-work environment.

AR00027292

5.3.3 Land Use Ordinance

The Petition Area is presently zoned AG-1 Restricted Agricultural District by the City and County of Honolulu Land Use Ordinance (LUO). As such, a Zone Change will be required for the 1,553.844 acre Petition Area.

5.3.4 Special Management Area

The Petition Area is located outside of the Special Management Area (SMA) as established by the City and County of Honolulu.

5.3.5 Ewa, Central Oahu and Primary Urban Center Public Infrastructure Maps

Based on comments received from the Department of Planning and Permitting (DPP) during the public review period, it should be noted that DPP is currently processing two separate but similar revisions to the Ewa, Central Oahu (CO) and Primary Urban Center (PUC) Public Infrastructure Maps (PIM) regarding the Honolulu High Capacity Transit Corridor Project.

In February 2008, the Department of Transportation Services (DTS) submitted a proposal to the DPP to revise the Ewa, CO and PUC PIMs by adding symbols for a "Rapid Transit Corridor," "Transit Stations," "Corporation Yard," and "Park and Ride" facilities. The proposed symbols represent the Locally Preferred Alternative (LPA) that was approved by the City Council via Ordinance 07-1. The DTS' proposal was circulated for public review and comment, and adoption of Resolution 08-97 occurred on May 7, 2007. Figure 2.8: Proposed Circulation Plan of the Final EIS has been revised to reflect the City's proposal in Resolution 08-97, CD1 for the Honolulu High Capacity Transit Corridor Project.

In March 2008, the City Council introduced Resolution 08-69 regarding a revision to the Ewa, CO and PUC PIM's be adding 40 "Transit Station" symbols along the length of the LPA. Resolution 08-69 does not include symbols for the "Rapid Transit Corridor," "Corporation Yard," and "Park and Ride" facilities. The DPP is currently preparing to circulate the proposal for public review and comment before forwarding a report and draft resolution to the City Council for action.

As of this writing, the City and County of Honolulu (City) has begun work on the Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor (HHCTC) project, with a target publication date in the second or third quarter of 2008. By the time the HHCTC Draft EIS is published, the final alignment of the "Rapid Ttransit Corridor and the locations of: "Transit Stations," "Corporation Yard" (transit maintenance and storage), "Park and Ride" facilities in Ewa will be known. Ho'opili is being designed to be transit-ready, and the land use plan, while subject to change, has been designed to accommodate a high-capacity transit corridor either along Farrington Highway or through the project site, with either one or two transit station locations. The Petitioner acknowledges that sites for a transit maintenance and storage facility and/or a portion of a park and ride facility may be required within the Petition Area.

AR00027293

5.4 REQUIRED PERMITS AND APPROVALS

The following is a list of major approvals and permits required for the implementation of the proposed project. From the earliest stages of the planning process, the Petitioner has worked with all affected agencies to obtain their comments and necessary approval of plan and specifications.

Table 5.9. Required Permits/Approvals

PERMIT/APPROVAL	APPROVING AUTHORITY	STATUS	PROJECT SUBMITTAL DATE
State Land Use District Boundary Amendment (with EIS)	State of Hawai'i Land Use Commission	Petition has been filed; processing on hold until EIS process has been completed.	First Quarter 2007
Zone Change	City and County of Honolulu Department of Planning and Permitting/City Council	Application to be filed assuming successful processing of SLUDBA.	Third Quarter 2009
Large Lot Subdivision ~~Approval~~ Action	City and County of Honolulu Department of Planning and Permitting	Application to be submitted after change the Zone Change application is approved.	Third Quarter 2010
National Pollutant Discharge Elimination System (NPDES) Permit	State of Hawai'i Department of Health	Application to be submitted prior to Building/Grading Permits.	2011
Building/Grading Permits	City and County of Honolulu Department of Planning and Permitting	Application to be filed after the Zone Change application is approved.	2011
Water Use Permit	State of Hawai'i Department of Land and Natural Resources, Commission on Water Resource Management	Application to be submitted prior to Building/Grading Permits	2011

AR00027295

6.0
Alternatives to the Proposed Action

6.0 ALTERNATIVES TO THE PROPOSED ACTION

In compliance with the provisions of Title 11, Department of Health (DOH), Chapter 200, Environmental Impact Statement Rules, Section 11-200-10(6), the alternatives considered are limited to those that would satisfy the objectives of the proposed mixed-use development, while minimizing the potential for adverse environmental impacts. The feasible alternatives must realistically address the project's economic characteristics while also responding to the surrounding land uses that will be impacted by the project. In conformance with applicable regulations, other possible alternatives have been investigated to identify alternative sites, the appropriate uses for the property, and how they would best be accomplished.

6.1 "NO-ACTION" ALTERNATIVE

The "no-action" alternative would not be consistent with stated governmental policies, which direct future growth to the 'Ewa region. The City and County of Honolulu *General Plan* states:

> *Encourage development within the secondary urban center at Kapolei and the Ewa and Central Oahu urban-fringe areas to relieve developmental pressures in the remaining urban-fringe and rural areas and to meet housing needs not readily provided in the primary urban center.*

Under this alternative, the site would remain as agricultural land, underutilized in terms of meeting the demand for residential homes (including affordable homes) and accompanying land uses. The potential benefit of this alternative is that while remaining under cultivation, the site would provide open space. Implementation of this alternative will avoid: infrastructure impacts (solid waste, wastewater and additional stormwater runoff generated on site); visual impacts (appearance of the site changing from agricultural fields to a master-planned urban development); the loss of agricultural employment; traffic impacts; and construction-related impacts (such as construction noise, construction equipment exhaust emissions, temporary traffic disruption, fugitive dust and soil erosion). Occasionally, however, continued cultivation, harvesting and plowing of the site will expose soils to the erosional forces of wind and rainfall. The demand for housing could result in the following scenarios or combinations thereof: there would be more pressure to develop in the other districts, including the rural areas and other areas currently used for cultivation; there could be a demand for higher density housing in undeveloped areas of 'Ewa at a density not experienced to date; there would be more "doubling up" (larger number of persons per household, with more than one family under roof); those that are not willing to put up with the previously described scenarios may decide to relocate to the U.S. mainland where housing prices have dropped.

AR00027297

The "no-action" alternative was rejected because it is not consistent with government plans to develop Kapolei as the Second City.

6.2 ALTERNATIVE SITES

There are very few large parcels left on O'ahu that are designated for residential development. The largest amount of developable land that is undeveloped lies in Central O'ahu and on the North Shore. As shown on the *Ewa Development Plan*, the Petition Area is designated mostly Low and Medium Density Residential. As such, the City and County of Honolulu has long recognized that the Petition Area is best used for residential and other development. Directing growth to 'Ewa and in the "urban-fringe" portions of Central O'ahu reduces the pressure to develop outside of the Urban Growth Boundary of Central O'ahu, and the North Shore, Ko'olau Loa, Ko'olau Poko and Wai'anae districts. This alternative has been rejected because it would be clearly contrary to *General Plan* policy. The potential benefit of this alternative is that for those that object to further development on the 'Ewa Plain, it might be preferable for development to occur elsewhere on O'ahu, such as in the Primary Urban Center, East Honolulu, Central O'ahu, North Shore, Ko'olau Loa, Ko'olau Poko and Wai'anae districts.

The potential benefit of this alternative is that while remaining under cultivation, the site would provide open space. Implementation of this alternative will avoid: infrastructure impacts (solid waste, wastewater and additional stormwater runoff generated on site); visual impacts (appearance of the site changing from agricultural fields to a master-planned urban development); the loss of agricultural employment; traffic impacts; and construction-related impacts (such as construction noise, construction equipment exhaust emissions, temporary traffic disruption, fugitive dust and soil erosion). Occasionally, however, continued cultivation, harvesting and plowing of the site will expose soils to the erosional forces of wind and rainfall.

6.3 ALTERNATIVES RELATED TO DIFFERENT DESIGNS OR DETAILS OF THE PROPOSED ACTIONS WHICH WOULD PRESENT DIFFERENT ENVIRONMENTAL IMPACTS

Different designs could be applied to the project, and depending on the density and design capacity, would result in different environmental impacts. For example, a higher density project that kept the same residential unit count as proposed (11,750) would reduce the buildable area (a positive benefit) and possibly reduce the quantity of surface runoff (a positive benefit). ~~This~~ Another potential benefit of this alternative is that it would likely be easier to serve by bus and correspondingly increase ridership. However, the residential buildings would be larger and taller. This alternative would not allow as wide a range of residential products to market and was thus rejected. Implementation of this alternative will not avoid: infrastructure impacts (solid waste, wastewater and additional stormwater runoff generated on site); visual impacts (appearance of the site changing from agricultural fields to a master-planned urban development); the loss of agricultural

AR00027298

employment; traffic impacts; and construction-related impacts (such as construction noise, construction equipment exhaust emissions, temporary traffic disruption, fugitive dust and soil erosion).

Another alternative would be to set aside less open space and to spread out the community over a larger land area. Such an alternative is best portrayed by the current *Kapolei Long Range Master Plan* and *Ewa Development Plan* Land Use Map designations for the Petition Area. This alternative would reduce the density (to some, a positive benefit) but consume more land, increasing the quantity of surface runoff, and requiring a much larger investment in grading and infrastructure. This alternative would make it difficult for residents to be served by bus, and even more difficult by high-capacity transit. Implementation of this alternative will not avoid: infrastructure impacts (solid waste, wastewater and additional stormwater runoff generated on site); visual impacts (appearance of the site changing from agricultural fields to a master-planned urban development); the loss of agricultural employment; traffic impacts; and construction-related impacts (such as construction noise, construction equipment exhaust emissions, temporary traffic disruption, fugitive dust and soil erosion). This alternative was also rejected.

The demand for safe drinking water and the quantities of wastewater, solid waste, and traffic generated would vary with different designs, depending on the number/quantity of residential units, schools, commercial square footage, and roads.

6.4 ACTIONS OF A SIGNIFICANTLY DIFFERENT NATURE WHICH WOULD PROVIDE SIMILAR BENEFITS WITH DIFFERENT ENVIRONMENTAL IMPACTS

One scenario that would be significantly different from the proposed action is that an elevated rail line and accompanying transit stops would not be built through Ho'opili. Implementation of this alternative will not avoid: infrastructure impacts (solid waste, wastewater and additional stormwater runoff generated on site); visual impacts (appearance of the site changing from agricultural fields to a master-planned urban development); the loss of agricultural employment; traffic impacts (assume greater traffic impacts than without the HHCTC project); and construction-related impacts (such as construction noise, construction equipment exhaust emissions, temporary traffic disruption, fugitive dust and soil erosion). The impacts of this scenario will be better described in the upcoming HHCTC DEIS.

For the 'Ewa district drivers enduring the longest morning commutes to the Central Business District or UH Mānoa, the modes of transportation will continue to be limited to: private motorized vehicle (including zipper lane), TheBus, TheBoat, Vanpool, et cetera. While this is a scenario that could inevitably result in lengthening commute times, individual commuters will either: bear with the commute in return for the comfortable lifestyles offered by their homes in 'Ewa; move from their homes in 'Ewa and move closer

AR00027299

to their workplaces or schools; or find schools and/or employment in the 'Ewa region. The opening of UHWO will reduce traffic from those undergraduate students in Leeward and Central O'ahu who commute to UH Mānoa, and indirectly reduce the demand for student housing on the UH Mānoa campus (reducing the demand for off-street parking demand on campus, reducing the demand for on-street parking in the surrounding neighborhoods, increasing the supply of student housing on campus, and reducing the demand for student housing off-campus). If the Petitioner is allowed to develop a mixed-use (residential/commercial/office/light industrial) project as proposed, then, more employment opportunities will be provided to existing residents of the region, reducing the need for some 'Ewa residents to commute outside of the District to work. To offset the non-implementation of the HHCTC project, the City and County of Honolulu may decide to increase The Bus and The Boat services. The positive benefits of this alternative is that the visual impact impacts of an elevated rail system would be avoided as well as long-term commitment of State and Federal funds for the HHCTC project. This alternative is not desirable, but feasible.

6.5 THE ALTERNATIVE OF POSTPONING ACTION PENDING FURTHER STUDY

Development of the 'Ewa region as O'ahu's Second City has been studied and planned for many years. Further study of any proposed development on the property would only be delaying what has long been proposed in the *Ewa Development Plan*. Therefore, this alternative was rejected, as it would not achieve the overall objectives for the project, which would create a mixed-use community that more employment opportunities will be provided to existing residents of the region, reducing the need for some 'Ewa residents to commute outside of the District to work. The potential benefit of this alternative is that while remaining under cultivation, the site would provide open space. Occasionally, however, continued cultivation of the site would generate dust when portions of the site are harvested and plowed. Implementation of this alternative will temporarily avoid: infrastructure impacts (solid waste, wastewater and additional stormwater runoff generated on site); visual impacts (appearance of the site changing from agricultural fields to a master-planned urban development); the loss of agricultural employment; traffic impacts; and construction-related impacts (such as construction noise, construction equipment exhaust emissions, temporary traffic disruption, fugitive dust and soil erosion). Occasionally, however, continued cultivation, harvesting and plowing of the site will expose soils to the erosional forces of wind and rainfall.

AR00027300

7.0
Contextual Issues

7.0 CONTEXTUAL ISSUES

Key issues within the context of the Ho'opili project are presented in this section.

7.1 RELATIONSHIP BETWEEN THE SHORT-TERM USES OF THE ENVIRONMENT AND THE MAINTENANCE AND ENHANCEMENT OF LONG-TERM PRODUCTIVITY

As discussed previously in this EIS, the Petition Area consists mainly of agriculturally cultivated cropland/or vacant land formerly under sugarcane cultivation. Due to the high demand for residential units and jobs throughout the State, particularly on the island of O'ahu, the Petitioner is proposing a mixed-use, transit-ready community including residential, business/commercial, light industrial/business, open space, parks, schools and other public facilities, in an area long-planned for urban development (*Ewa DP).*

Allowing the Petition Area to remain in its current state would be inconsistent with the property's *Ewa Development Plan* designation for Low and Medium Density Residential, High Density Residential, Agricultural and Preservation, Parks, Transit Node (High Density Residential and Commercial), and Future Intermediate School. While it is acknowledged that productivity of the Petition Area for cultivated crop production would be lost if the proposed project is developed, it is the City and County of Honolulu's land use policy to protect large tracts of land in Central O'ahu and the North Shore for agricultural uses, by establishing an Urban Growth Boundary.

Through careful planning during the planning and design phases, the property will complement the urban character of the emerging Secondary Urban Center, as planned by the City and County of Honolulu. At full build-out, the Ho'opili project has the greater potential for long-term productive use of the Petition Area. The development is large enough and will be designed to allow residents to live, work, learn, play, and shop in one area, thus generating significant social and economic benefits to the community through employment, educational, and home ownership opportunities, and the provision of infrastructure and other community services and facilities.

7.2 CUMULATIVE AND SECONDARY IMPACTS

This chapter identifies cumulative and secondary impacts that may result from the development of Ho'opili and the East Kapolei region. During the public review period, the State Department of Land and Natural Resources (DLNR), Engineering Division wrote: "DLNR currently owns approximately 183 acres of land near and/or adjacent to the Ho'opili project…The DLNR parcels have excellent development potential based on the location of these lands adjacent to or near major arteries (H-1 Freeway, Farrington Highway, North-South Road) and the City's proposed transit line as well as the substantial increase development projects in the area. Consequently, regional infrastructure should

AR00027302

take into consideration the potential development of the DLNR parcels, and DLNR requests that it be included in the planning and design of any regional infrastructure in the area that would serve the DLNR parcels."

7.2.1 Impacts on the Physical Environment

Climate, Topography, and Soils. Planned developments in the East Kapolei region (the proposed Ho'opili project, University of Hawai'i at West O'ahu (UHWO), Department of Hawaiian Home Lands (DHHL) East Kapolei Development Parcels 1 and 2, Kroc Center, and the "DLNR parcels") are not expected to adversely impact regional climate, topography, and soils of existing developments, including, but not limited to, the communities of Waipahu, West Loch, Honouliuli, 'Ewa Villages, 'Ewa, Villages of Kapolei and Makakilo. However, within their respective project sites, construction of the East Kapolei developments will impact mostly minor topographic features and soils, and new buildings may affect the respective micro-climate of each building site (by retaining and/or reflecting solar energy and heat, creating shade where none presently exists, or creating "wind tunnels"). Grading operations will comply with DOH regulations and are not expected to adversely impact air and water quality.

Drainage and Groundwater. Regional infrastructure will be developed to control drainage in the East Kapolei area, for those areas draining into Kalo'i Gulch. The planned developments will introduce impervious surfaces through the construction of buildings, roadways, parking areas, and walkways. Increased impervious surfaces (i.e., roofs, roadway surfaces, and sidewalks) will increase the potential for runoff, although existing and proposed detention basins throughout East Kapolei will effectively manage drainage towards Kalo'i Gulch or other drainage basins. Through implementation of the proposed drainage improvements, the planned developments in East Kapolei are not expected to adversely impact existing developments, including, but not limited to, the communities of Waipahu, West Loch, Honouliuli, 'Ewa Villages, 'Ewa, Ocean Pointe, Villages of Kapolei and Makakilo. Additionally, landscaping introduced by the East Kapolei developments will reduce the potential for soil erosion, compared to current conditions on vacant and actively cultivated lands. All drainage facilities will comply with the City and County of Honolulu's Storm Drainage Standards. A non-potable water system will be developed for 'Ewa to reduce the demand for safe drinking water from the BWS system.

Natural Hazards. It is unlikely that any of the proposed structures and uses associated with the planned developments in 'Ewa will affect the potential occurrence of earthquakes, hurricanes, or tsunami or adversely impact existing developments, including, but not limited to, the communities of Waipahu, West Loch, Honouliuli, 'Ewa Villages, 'Ewa, Villages of Kapolei and Makakilo. By designing future structures to the then-approved building code, future buildings will likely be designed to mitigate the potential damage from natural hazards.

AR00027303

Flora and Fauna. The cumulative impact of the planned developments in East Kapolei is the reduction of habitat. However, past and present agricultural activities in the Petition Area have altered natural habitats; as such, existing flora and fauna are primarily introduced species. During construction, faunal species are likely to vacate the site for suitable habitats nearby. After construction, these species may return, depending on their preference of habitat and the landscaping provided. The planned developments in East Kapolei are not expected to adversely impact the flora and fauna of existing developments, including, but not limited to, the communities of Waipahu, West Loch, Honouliuli, 'Ewa Villages, 'Ewa, Villages of Kapolei and Makakilo.

7.2.2 Impacts on the Human Environment

Archaeological/Historic and Cultural Resources. An archaeological inventory survey was conducted of the Petition Area. Five historic properties were documented on the Petition Area. All five historic properties have been assessed as eligible for the State Register of Historic Places under Criteria C and D, except for Site 4344, which is only eligible under criterion D. The State Historic Preservation Division (SHPD) concurs with these significance assessments. According to SHPD, the archaeological inventory survey report is now accepted. In addition, a preservation plan and archaeological monitoring plan will be prepared and submitted to SHPD for its review and approval. Recently completed archaeological inventory survey reports for both the proposed project and the neighboring 500-acre UHWO site provide more information about the 'Ewa area and consistently show that due to prior sugar cane cultivation, pre-historic features are nearly non-existent. A cultural impact assessment was also prepared for the Petition Area and it found that there are no contemporary or continuing cultural or traditional practices currently occurring within the proposed Project Area. Therefore, no impacts are expected and no mitigation measures are planned. The regional cumulative impacts on archaeological and cultural resources within 'Ewa appear to be minimal. The planned developments in East Kapolei are not expected to adversely impact the archaeological and historical resources of the existing surrounding communities, including, but not limited to, the communities of Waipahu, West Loch, Honouliuli, 'Ewa Villages, 'Ewa, Villages of Kapolei and Makakilo.

Agriculture. Lands in the Petition Area and the remainder of 'Ewa were historically used for sugarcane cultivation and most recently for diversified agriculture. Much of East Kapolei (including the Petition Area) is actively cultivated through short-term agreements. With the proposed developments in East Kapolei (UHWO, DHHL East Kapolei Development Parcel 1, DHHL East Kapolei Development Parcel 2 and Ho'opili, land will be withdrawn from production, resulting in some loss in revenues, jobs, and payroll, unless replacement agricultural leases are established elsewhere. While ~~A~~ample agricultural land is available to accommodate the projected growth of diversified agriculture on O'ahu (such as Central O'ahu and the North Shore) and elsewhere in the State of Hawai'i, some reviewers of the Draft EIS have expressed concern about the potential loss of agricultural land. The planned developments in East Kapolei are not expected to adversely impact the agricultural resources of the existing surrounding communities, including, but not limited to, the communities of Waipahu, West Loch,

AR00027304

Honouliuli, 'Ewa Villages, 'Ewa, Villages of Kapolei and Makakilo. However, ultimate development of the Petition Area and the remainder of East Kapolei will reduce the exposure of soils to the erosional forces of wind and rainfall.

Noise. Over the long term, as 'Ewa develops and the 'Ewa population grows, noise levels will increase above current conditions. Residential, business/commercial, light industrial/business, parks, schools and other public facilities will generate noise. New roadways and improvements to existing roadways are proposed, and vehicles traveling to, from, through, and within the 'Ewa area will be a significant contributor of noise. The planned HHCTC will also generate noise. East Kapolei is generally not surrounded by noise sensitive uses (residential, educational and medical structures and facilities). Mauka of East Kapolei is H-1 and vacant land. To the west is the Kapolei Golf Course. To the south are Kapolei Parkway and the 'Ewa Villages Golf Course and to the east and grade-separated is Old Fort Weaver Road and Honouliuli Village. ~~However~~Moreover, noise-sensitive uses (residential, educational and medical) occurring in buildings are likely to be insulated and equipped with air conditioners, mitigating noise from traffic, wind, and aircraft.

Air Quality. Emissions from cars and equipment used to generate electricity can affect air quality. The planned developments in East Kapolei will attract traffic and use electricity, but are not expected to significantly affect regional air quality, as new technologies, increasingly stringent air pollution control regulations and improving automobile technology, and alternative forms of transportation (i.e., Honolulu High-Capacity Transit Corridor (HHCTC), buses and other public transportation, bicycling, walking) may offset potential increases in air pollution. Predominant tradewinds during the afternoon provide dispersal of emissions. The planned developments in East Kapolei are not expected to adversely impact the long-term air quality of the existing surrounding communities, including, but not limited to, the communities of Waipahu, West Loch, Honouliuli, 'Ewa Villages, 'Ewa, Villages of Kapolei and Makakilo. Depending on the phase of construction, there will be occasions when dust may be generated despite mitigative measures (such as during gusts of particularly strong wind) and depending on the location of construction may affect Honouliuli (which is mostly upwind of the project site), 'Ewa Villages (separated by the 'Ewa Villages Golf Course) and the DHHL East Kapolei Development Parcel 2 project (abutting). The Petitioner and DHHL is coordinating on mitigating this potential impact.

Man-Made Hazards. No industrial facilities handling explosive or fire-prone materials (i.e., liquid propane, gasoline, or other storage tanks) exist in the Petition Area. However, there are two hazardous sites in and near the East Kapolei area – the former 'Ewa Sugar Mill, which is surrounded by the 'Ewa Villages residential and golf project and has a current status of No Further Remedial Action Planned, and the 'Ewa Sugar/O'ahu Sugar Company Pesticide Mixing and Loading Site, which is located to the east of North-South Road on Department of Hawaiian Home Lands (DHHL) property. The land uses proposed by the planned developments in 'Ewa (no heavy industrial land uses or zoning are

AR00027305

proposed) are not likely to expose people or buildings to explosive or flammable fuels or chemical containers. The planned land uses in East Kapolei are not expected to expose residents of the existing surrounding communities, including, but not limited to, the communities of Waipahu, West Loch, Honouliuli, 'Ewa Villages, 'Ewa, Villages of Kapolei and Makakilo to noxious land uses.

Visual Resources. The planned developments in East Kapolei will change the open space character of the area and introduce urban structures and street trees including the UHWO campus, various types of residences (associated with DHHL, UHWO and the proposed project), commercial/industrial/business centers (associated with DHHL, UHWO and the proposed project), schools, public uses (the Kroc Center, churches) and transportation facilities (such as the North-South Road and in the most visually prominent scenario of high-capacity transit – elevated rail, associated transit stations, a park and ride facility and possibly a rail transit maintenance and storage facility). The East Kapolei developments will include landscaping to reduce the bulk of buildings and structures, and enhance the visual character of the sites. In the case of Ho'opili, open space buffers will reduce the impact of views from the H-1 Freeway, and relatively low-intensive land uses are proposed along Old Weaver Road near Honouliuli Village. Also within Ho'opili, mostly lower density housing is proposed along the 'Ewa Villages Golf Course and along DHHL East Kapolei Development Parcel 2, to maintain the character of these surrounding areas. The planned developments in East Kapolei will permanently replace the open space character of East Kapolei with a master-planned community as viewed from the existing surrounding communities, including, but not limited to, the communities of Waipahu, West Loch, Honouliuli, 'Ewa Villages, 'Ewa, Villages of Kapolei and Makakilo.

7.2.3 Impacts on the Socio-Economic Environment

Population, Housing, Neighborhood Commercial Uses, and Character/Lifestyle of the Community. The planned developments (UHWO, DHHL East Kapolei Development Parcels 1 and 2, Kroc Center and Ho'opili) will help to further the growth of the Second City by adding to the critical mass of residential, business/commercial, light industrial/business, open space, parks, schools and other public facilities in 'Ewa, making it a more "complete" community. In the same fashion that many residents in East Honolulu or the Primary Urban Center have no need to leave to visit other districts for essential "goods and services," 'Ewa residents may someday have little need to leave their district. No homes or residents will be displaced by the East Kapolei projects, which will be developed on lands that are currently undeveloped, most of which is being cultivated. The planned developments in East Kapolei will provide a variety of live, work, play, study and shopping opportunities to the existing surrounding communities, including, but not limited to, the communities of Waipahu, West Loch, Honouliuli, 'Ewa Villages, 'Ewa, Villages of Kapolei and Makakilo, which are not currently available on site.

Economic Impacts and Employment. As the planned developments in East Kapolei are gradually built out, agricultural lands will be withdrawn from agricultural production,

AR00027306

resulting in some loss of revenues, jobs, and payroll. It is likely though, that cultivation is likely to gradually relocate to vacant agricultural land further north of East Kapolei and in Kunia, Central O'ahu, and the North Shore. Over time, the loss of economic productivity from agricultural activity will be more than offset by the construction of the planned developments, which will provide significantly greater revenues, more employment opportunities, and higher payrolls. Local businesses will profit from the developments in 'Ewa, and money spent by workers and businesses will flow through the West O'ahu regional economy particularly in the City of Kapolei. The County and State will benefit from the developments through the generation of real property, income and general excise tax revenues, more than off-setting government services. The planned developments in East Kapolei will provide a variety of live, work, play, study and shopping opportunities to the existing surrounding communities, including, but not limited to, the communities of Waipahu, West Loch, Honouliuli, 'Ewa Villages, 'Ewa, Villages of Kapolei and Makakilo, which are not currently available on site.

7.2.4 Impacts on Infrastructure Facilities

Water. Many of the new residents in 'Ewa will have already been residing on O'ahu, thus the demand for water will shift from where they live now on O'ahu to 'Ewa. The 'Ewa projects are being designed assuming to assure that there are adequate sources, storage and transmission facilities to service 'Ewa, without having to reduce source from where future residents currently reside elsewhere on O'ahu and relocate the water allocation to 'Ewa. UHWO and Ho'opili will be designed to include dual water systems, allowing new parks, open space and roadway landscaping to be irrigated with recycled water from the Honouliuli Water Reclamation Facility (WRF). The planned developments in East Kapolei are not expected to adversely impact the supply of drinking water for the existing surrounding communities, including, but not limited to, the communities of Waipahu, West Loch, Honouliuli, 'Ewa Villages, 'Ewa, Villages of Kapolei and Makakilo.

Wastewater. Many of the new residents in 'Ewa will have already been residing on O'ahu, thus the need for collection, treatment and disposal of wastewater will shift from where they live now on O'ahu to 'Ewa. The 'Ewa projects are being designed assuming to assure that there are adequate collection, treatment and disposal facilities to service 'Ewa. Where other wastewater treatment facilities on O'ahu do not have the capability to provide recycled water, Honouliuli does. Also, since UHWO and Ho'opili will be designed to include dual water systems, this will allow parks, open space and roadway landscaping to be irrigated with recycled water from the Honouliuli WRF. The planned developments in East Kapolei are not expected to adversely impact the capacity of the existing wastewater system to treat and dispose of wastewater currently being generated from the existing surrounding communities, including, but not limited to, the communities of Waipahu, West Loch, Honouliuli, 'Ewa Villages, 'Ewa, Villages of Kapolei and Makakilo.

AR00027307

Drainage. The Petition Area falls within three different drainage basins. One of these three drainage basins, Kalo'i Gulch, is shared by UHWO, DHHL, Ho'opili and the Kroc Center. The Kalo'i Gulch drainage basin stretches to the top of the eastern slopes of the Wai'anae mountain range and terminates near the ocean in the vicinity of Haseko's Ocean Pointe development. The drainage basin, mauka of the H-1 Freeway, is 3,000 acres and generates a peak flow of 5,000 cubic feet per second (CFS). The drainage basin size increases to 4,330 acres and carries a peak flow of 8,900 CFS at the entrance to 'Ewa Villages. Approximately only 100 acres of the Ho'opili project are within this watershed.

The proposed developments in East Kapolei will increase impervious surfaces such as roadways, roofs, paved parking areas, and sidewalks. These surfaces will cause an increase in storm water discharge within the Kalo'i Gulch drainage basin. However, each of the East Kapolei projects (the proposed Ho'opili project, University of Hawai'i at West O'ahu (UHWO), Department of Hawaiian Home Lands (DHHL) East Kapolei Development Parcels 1 and 2, Kroc Center) will be creating on-site detention basins to collect all storm water runoff and discharge the flow at a rate that will not exceed pre-development conditions. The East Kapolei projects will also be providing storage and detention to meet the Rules Relating to Storm Drainage Standards with respect to water quality standards. The basin size could be decreased at some time in the future when the terminus of Kalo'i Gulch basin is finalized. All projects discharging to the Kalo'i Gulch basin currently have discharge restrictions and these restrictions will continue until the Kalo'i Gulch outlet is opened. Through implementation of the proposed drainage improvements, the planned developments in East Kapolei are not expected to adversely impact existing developments, including, but not limited to, the communities of Waipahu, West Loch, Honouliuli, 'Ewa Villages, 'Ewa, Ocean Pointe, Villages of Kapolei and Makakilo.

Solid Waste. While many of the new residents in 'Ewa will have already been residing on O'ahu, there will be new residents attracted to and residing in Ho'opili who will be new to O'ahu. As O'ahu's population increases, the capacity of the Waimānalo Gulch Landfill will decrease. The issue of solid waste recycling and ultimate disposal will not only affect 'Ewa, including, but not limited to, the communities of Waipahu, West Loch, Honouliuli, 'Ewa Villages, 'Ewa, Villages of Kapolei and Makakilo, but every resident on O'ahu.

Roadways and Traffic. Ho'opili involves development of a mixed-use community on approximately 1,555 acres in East Kapolei. The Ho'opili Conceptual Land Use Plan ("Plan") reflects the desire for a community that is "complete" with: affordable living options; employment centers; quality schools; shopping, gathering and recreational places; and parks and open space for residents. Implementation of the Plan will allow residents the ability to live, work, learn, play, and shop within Ho'opili without needing to use personal motor vehicles on regional roadways.

Ho'opili will be connected to the surrounding 'Ewa District (and neighboring Department of Hawaiian Home Lands (DHHL), the University of Hawai'i at West O'ahu (UHWO),

AR00027308

Kroc Center and the Hawaii Community Development Authority (HCDA) properties by a network of closely-spaced gridded streets and bicycle paths within Ho'opili which allows a variety of circulation options for residents and visitors through East Kapolei. Wider tree-lined boulevards will create a distinct axis running north-south and diagonally east-west across the site, but unlike a conventional subdivision of cul-de-sacs, there will many more streets, sized at a walking scale. Ho'opili is being designed to be transit-ready, and the land use plan, while subject to change, has been designed to accommodate a high-capacity transit corridor either along Farrington Highway or diagonally through the project site, with either one or two transit station locations. While the proposed residential unit count will not change, the land use plan will need to be adjusted depending on the final alignment of the high-capacity transit corridor, as the potential for noise impact from an elevated high-capacity transit alignment would likely require taller, higher density residential or industrial uses along the alignment. The final siting of the transit station location(s) will also provide transit-oriented development potentials, which will also cause the plan to be refined, as higher intensity development (and density) will be concentrated around the transit station(s). Also possible is a transit maintenance and storage facility.

There are several major transportation projects that have been long-planned for East Kapolei. The Ho'opili project has been planned assuming that certain planned transportation projects will be constructed including a portion of North-South Road between Farrington Highway and Kapolei Parkway; a portion of the North-South Road/H-1 Freeway interchange; a portion of the intersection of North-South Road and Farrington Highway; the long-planned widening of Farrington Highway fronting Ho'opili (and UHWO); the proposed East-West Connector Road through the Petition Area (that would connect Farrington Highway with Fort Weaver Road, through UHWO, DHHL East Kapolei Development Parcel 2 and Ho'opili); and the segment of the proposed Honolulu High-Capacity Transit Corridor project through the Petition Area.

Assuming that mitigation measures are implemented, the result of the analysis indicates that the Ho'opili project would result in what the traffic engineering consultant identifies as significant impacts to only one intersection under Scenario A: With Transit Corridor Scenario; this would occur at Farrington Highway/Leokū Street. Under Scenario B: Without Transit Corridor Scenario, a total of three intersections are anticipated to result in what the traffic engineering consultant identifies as significant impacts as a result of the Ho'opili project: Farrington Highway/Leokū Street, Fort Weaver Road/Old Fort Weaver Road and Fort Weaver Road/Renton Road. Those residents surrounding the project site, including, but not limited to, the communities of Waipahu, West Loch, Honouliuli, 'Ewa Villages, 'Ewa, Villages of Kapolei and Makakilo who travel through the above identified intersections would be most impacted by the proposed project.

7.2.5 Impacts on Public Facilities and Services

Electrical and Communication Facilities. Steam units, diesel units, and gas turbines used to generate electricity also generate emissions and affect air quality. Any increase in demand for electricity not generated by renewable resources will have an indirect impact

AR00027309

on air quality. Sustainability guidelines have been developed by UHWO. Sustainability options are being considered for the Ho'opili project.

Ho'opili project buildings, activities, and site grounds are planned to be designed with energy-saving considerations, and the project will strive to be consistent with the State's objective to promote cost-effective energy conservation through the adoption of energy-efficient practices and technologies. Due to the sunny climate, the Petition Area (and the rest of 'Ewa) will be suited for the use of renewable energy technologies including photovoltaics. In addition, based on the Department of Business, Economic Development & Tourism (DBEDT), Strategic Industries Division's recommendations, Ho'opili's mechanical and electrical consultants, in consultation with its sustainability consultant, will be directed to review the City and County of Honolulu's Energy Code early in the project and to consult with Hawaiian Electric Company, Inc. (HECO) on demand-side management programs that offer rebates for installation of energy-efficient technologies. The planned developments in East Kapolei are not expected to adversely impact the availability of energy for the existing surrounding communities, including, but not limited to, the communities of Waipahu, West Loch, Honouliuli, 'Ewa Villages, 'Ewa, Villages of Kapolei and Makakilo.

The planned developments in East Kapolei will also increase the demand for communications services (i.e., cable television and telephone service), but are unlikely to have an adverse effect on existing communications systems for the existing surrounding communities, including, but not limited to, the communities of Waipahu, West Loch, Honouliuli, 'Ewa Villages, 'Ewa, Villages of Kapolei and Makakilo.

Recreational Facilities. The 'Ewa region is the fastest growing region in O'ahu, and the proposed developments in 'Ewa will help to meet the demand for additional recreational facilities. Parks will be provided by Ho'opili to meet the Petition Area's requirements of the City and County of Honolulu's Park Dedication Ordinance. New recreational facilities (i.e., tennis courts, basketball/volleyball courts, and jogging paths) within the UHWO campus are also planned for use primarily by students, faculty, and staff. Additionally, the private developer of UHWO's lands will provide recreational facilities in accordance with the City and County of Honolulu's Park Dedication Ordinance. The DHHL residential subdivision adjacent to and southwest of the Ho'opili community proposes 4.5 acres for park use and 10.7 acres for a community center to be developed and operated by the Salvation Army. The proposed center could include a swimming pool, performing arts center, child care center, gymnasium, education center, game and recreation areas, and other multi-use spaces. The facilities would be available to the general public.

Existing regional park facilities in West O'ahu, Central O'ahu, and Waipi'o may be visited by new residents of the East Kapolei developments; however, other park facilities have long been planned in Kalaeloa. The planned developments in East Kapolei are not expected to adversely impact State and County parks used by residents of the existing

AR00027310

surrounding communities, including, but not limited to, the communities of Waipahu, West Loch, Honouliuli, 'Ewa Villages, 'Ewa, Villages of Kapolei and Makakilo.

Medical Facilities. Health care services in the 'Ewa region are provided by Hawai'i Medical Center West (the nearest hospital facility), Pali Momi Medical Center, Wahiawā General Hospital, Kaiser Permanente Waipi'o Clinic, and the recently opened Kapolei Medical Park (located across the Kapolei Shopping Center at the corner of Farrington Highway and Fort Barrette Road). Other routine medical services can be obtained at major hospital facilities in urban Honolulu, about a 30-minute drive from the subject property. The City and County of Honolulu has 18 emergency medical services Advanced Life Support Ambulance units and two Rapid Response Paramedic units on O'ahu. Two of the Advanced Life Support Ambulance units are located nearby, one at the Kapolei Fire Station, the other at the Waipahu Fire Station. One of the Rapid Response Paramedic units is located at the nearby Hawai'i Medical Center West. The proposed UH West O'ahu student center is programmed to include a student health clinic.

The East Kapolei projects will increase the population of Kapolei, and as such, there will be an occasional and unavoidable demand for emergency medical services. It is unlikely, however, that this demand will impact the level of service provided to other residents of O'ahu. Existing medical and healthcare facilities in the 'Ewa region and surrounding areas should be able to accommodate the anticipated increase in demand. The planned developments in East Kapolei are not expected to adversely impact the availability of medical facilities for the existing surrounding communities, including, but not limited to, the communities of Waipahu, West Loch, Honouliuli, 'Ewa Villages, 'Ewa, Villages of Kapolei and Makakilo.

Educational Facilities. The UH West O'ahu adjacent to and west of the Ho'opili project will be a higher education institution in the 'Ewa region, enabling Leeward and Central O'ahu residents to obtain post-secondary degrees without commuting to the UH Mānoa campus or other higher education institutions in Honolulu.

The demand for educational facilities will increase as the population of 'Ewa grows. The Petitioner is setting aside land for three elementary schools, one middle school, and one high school with Ho'opili. UHWO has set aside land for an elementary school site near its southern boundary that might be shared by residents of the DHHL East Kapolei Development Parcel 1 project. The DHHL East Kapolei Development Parcel 2 project includes one elementary and one middle school sites. The State of Hawaii Department of Education (DOE) is also contemplating a high school on DHHL land immediately north of the UH West O'ahu site. Since the school-aged population is not constant, there is a possibility that not all of the above schools (a total of 2 high schools, two middle schools, and five elementary schools) will be needed after 20 to 25 years (the approximate time frame required for full build out of the combined East Kapolei projects. Through providing required public school sites (and the timely construction of schools by the State DOE), the planned developments in East Kapolei are not expected to adversely impact existing

AR00027311

developments, including, but not limited to, the communities of Waipahu, West Loch, Honouliuli, 'Ewa Villages, 'Ewa, Villages of Kapolei and Makakilo. During the public review period, the DOE noted that "…the number of schools required for this project may change if the developer decides to increase residential densities per potential transit-oriented development (TOD) zoning."

Police Protection. East Kapolei is located within Honolulu Police Department (HPD) District 8, which encompasses the leeward coast and the 'Ewa Plain. There are approximately 100 field officers assigned to this district, and response time for the entire district fluctuates between five and seven minutes. In order to meet the growing needs of the 'Ewa Plain communities, in 2000, the City and County of Honolulu opened the Regional Kapolei Police Station at 1100 Kamokila Boulevard.

The East Kapolei projects will increase the population of Kapolei and the demand for police service. According to the *Ewa Development Plan*, the 'Ewa Villages Substation is planned to service the East 'Ewa region, which includes East Kapolei. The service date for this substation has yet to be determined. The Petitioner is proposing a public facility site immediately mauka of Farrington Highway near the western portion of Parcel B for a use such as a police substation, fire station and/or emergency medical service (EMS) site. The planned developments in East Kapolei are not expected to adversely impact the availability of police protection for the existing surrounding communities, including, but not limited to, the communities of Waipahu, West Loch, Honouliuli, 'Ewa Villages, 'Ewa, Villages of Kapolei and Makakilo.

Fire Protection. Fire protection in the *Ewa Development Plan Area* is provided by the Honolulu Fire Department (HFD) 'Ewa Beach Fire Station (an engine company), Makakilo Fire Station (an engine company), and Kapolei Fire Station (an engine and ladder company, and the Battalion 4 Headquarters). The Kapolei Fire Station located in Kapolei Business Park was completed in 1995 to serve the expanding development on the 'Ewa Plain.

The East Kapolei projects will increase the population of Kapolei and the demand for fire service. According to the *Ewa Development Plan*, to meet the projected population and economic growth in 'Ewa by 2020, three fire stations at 'Ewa Villages, Ko 'Olina, and Makaiwa Hills are planned, however service dates have yet to been determined. A new fire station is being planned on the DHHL East Kapolei Development Parcel 1 site near the intersection of Kapolei Parkway and North-South Road. The Petitioner is proposing a public facility site immediately mauka of Farrington Highway near the western portion of Parcel B for a use such as a fire station, EMS site and/or police substation. The planned developments in East Kapolei are not expected to adversely impact the availability of fire protection for the existing surrounding communities, including, but not limited to, the communities of Waipahu, West Loch, Honouliuli, 'Ewa Villages, 'Ewa, Villages of Kapolei and Makakilo.

AR00027312

7.3 IRREVERSIBLE AND IRRETRIEVABLE COMMITMENTS OF RESOURCES

The proposed Ho'opili project would result in the irreversible and irretrievable commitment of certain natural and fiscal resources. Major resource commitments include the Petition Area and the money, construction materials, non-renewable resources, labor, and energy required for the project's completion.

The Petition Area was historically used for sugarcane cultivation; presently portions are under short-term agreements for diversified agriculture. The majority of the Petition Area is classified as Prime Agricultural Land by the ALISH system; however, a substantial commitment of water and land is required to realize the property's agronomic qualities. For instance, the price of water and land rent being enjoyed by the tenants on the Petition Area are well below market rates. In addition, there are agricultural lands that are more suitable for agricultural purposes (in relation to State and County plans to create a second city in 'Ewa) can be found elsewhere on O'ahu and throughout the State of Hawai'i.

The proposed Ho'opili project will require a substantial monetary investment to install both off-site and on-site infrastructure (i.e., roads, drainage, water, and wastewater facilities). The development will increase the use of existing public infrastructure and services, but in return will also generate revenues to the State and County in the form of excise, income and property taxes as well as provide needed residential, employment, recreational, educational and retail opportunities.

Labor and materials, which are mostly non-renewable and irretrievable resources, will be required during construction. After construction, operation of the project will require the continued use of water and electricity. Nevertheless, the proposed development will significantly lessen the amount of water used that was previously needed to serve lands used for agricultural purposes. In addition, non-potable water (brackish and/or reclaimed water) will be used for irrigation purposes where allowed under DOH regulations. Sustainability guidelines are being considered for the Ho'opili project, and the Petitioner will try to incorporate various measures to reduce conventional electrical consumption, or to use renewable energy sources.

The proposed Ho'opili project will require an irreversible and irretrievable commitment of resources, but will provide significant socio-economic benefits to the City and County of Honolulu and the State of Hawai'i. Development of the Petition Area will provide residential and employment. The proposed use of the Petition Area is consistent with the *Ewa Development Plan* and will enhance the growth of the Second City, enabling residents to live, work, learn, play, and shop without commuting to areas outside of the 'Ewa region for essential "goods and services."

AR00027313

7.4 PROBABLE ADVERSE ENVIRONMENTAL EFFECTS THAT CANNOT BE AVOIDED

The environmental impacts anticipated to result from development of the Ho'opili project are typical of any large-scale development and have been discussed throughout this EIS. Although uses of the Petition Area and adjacent properties, in the past and present, have significantly altered the natural landscape, under the current proposal (a mixed use community), the existing landscape will be transformed to urban development.

Construction-related Impacts. Potential environmental impacts (i.e., noise, soil erosion, fugitive dust and exhaust emissions, and temporary traffic disruption) will primarily occur during the construction period (to occur in various parts of the Petition Area through 2030). All construction activities will occur during daylight hours and will comply with DOH noise regulations to minimize increases in noise levels. During construction, the Petition Area may be subject to potential soil erosion and fugitive dust; as such, all construction activities will comply with State DOH regulations, and after construction, soil erosion will likely be reduced compared to current conditions (cultivation).

Infrastructure Impacts. Solid waste, wastewater and additional stormwater runoff will be generated on-site, and energy and water will be consumed for operation of the proposed Ho'opili project. Since many of the new residents of the Ho'opili project already reside on O'ahu, they are already generating solid waste, wastewater and stormwater runoff as well as consuming electricity and water. These impacts are typical of urban development and will be mitigated at Ho'opili through site design, the proper selection and installation of fixtures and appliances, and management practices. Major on-site and off-site infrastructure improvements proposed as part of the proposed project include the installation of new safe drinking and non-potable water systems (including storage and transmission), wastewater collection systems, major drainage improvements, on- and off-site transportation facility improvements (including roads and pedestrian/bicycle paths), electrical/communication infrastructure (including those that harness renewable sources), and designs and practices than facilitate recycling.

Visual Impacts. The appearance of and the views through the Petition Area will significantly change as agriculture-related structures and vegetation are replaced by urban structures and trees. However, the project site and area are relatively flat, providing no shoreline views. Views from future internal roadways will be given consideration to the extent possible, and extensive landscaping and appropriate architectural design will mitigate the visual appearance of the developed areas.

Faunal Impacts. The number of some introduced birds will likely increase, while the number of introduced birds that prefer open grasslands and agricultural fields will likely decrease. No native, threatened, or endangered species have been observed, and as such, none are expected to be impacted by the proposed project.

AR00027314

Agricultural Impacts. Some of the public currently benefits from employment and income generated through short-term revocable agricultural leases on portions of the Petition Area. These cultivated lands will gradually be withdrawn from agricultural production for the development of the Ho'opili community; however, there is an ample supply of land suitable for diversified agriculture on O'ahu and the State of Hawai'i. The proposed project is located within the Urban Growth Boundary delineated in the *Ewa Development Plan* and planned for urban development, not agricultural production.

Traffic Impacts. The Petitioner acknowledges that the traveling time for residents in the 'Ewa (and Wai'anae and Central O'ahu) regions commuting to jobs and/or schools in the Primary Urban Center as one of the most serious issues facing O'ahu today. This has been recognized by various State and County agencies including the O'ahu Metropolitan Planning Organization (OMPO), the State Department of Transportation (DOT), the City and County of Honolulu Department of Transportation Services (DTS) and the City County of Honolulu Department of Planning and Permitting, Traffic Review Branch (DPP TRB), and is being addressed through the Statewide Transportation Improvement Program (STIP) process, State and County Capital Improvements Program (CIP), the Ewa Impact Fee, private developers and the City's Honolulu High-Capacity Transit Corridor (HHCTC) project.

The proposed Ho'opili project involves development of a mixed-use community on approximately 1,555 acres in 'Ewa. The Conceptual Land Use Plan reflects the desire for a community that is "complete" with: affordable living options; employment centers; quality schools; shopping, gathering and recreational places; and parks and open space for residents. Implementation of the Plan will allow residents the ability to live, work, learn, play, and shop within Ho'opili without needing to use personal motorized vehicles on regional roadways.

Ho'opili will be connected to the surrounding 'Ewa District (and neighboring Department of Hawaiian Home Lands (DHHL), the University of Hawai'i at West O'ahu (UHWO) and the Hawaii Community Development Authority (HCDA) properties by an internal network of closely-spaced gridded streets and bicycle paths which allow a variety of circulation options for residents and visitors. Wider tree-lined boulevards will create a distinct axis running north-south and diagonally east-west across the site, but unlike a conventional subdivision of cul-de-sacs, there will many more streets, sized at a walking scale. Ho'opili is being designed to be transit-ready, and the land use plan, while subject to change, has been designed to accommodate a high-capacity transit corridor either along Farrington Highway or diagonally through the project site, with either one or two transit station locations. While the proposed residential unit count will not change, the land use plan will need to be adjusted depending on the final alignment of the high-capacity transit corridor, as the potential for noise impact from an elevated high-capacity transit alignment would likely require taller, higher density residential or industrial uses along the alignment. The final siting of the transit station location(s) will also provide transit-oriented development potentials, which will also cause the plan to be refined, as higher

AR00027315

intensity development (and density) will be concentrated around the transit station(s). Also possible is a transit maintenance and storage facility.

There are several major transportation projects that have been long-planned for East Kapolei. The Ho'opili project has been planned assuming that certain planned transportation projects will be constructed including a portion of North-South Road between Farrington Highway and Kapolei Parkway; a portion of the North-South Road/H-1 Freeway interchange; a portion of the North-South Road/Farrington Highway; the long-planned widening of Farrington Highway fronting Ho'opili; the proposed East-West Connector Road through the Petition Area; and the segment of the proposed Honolulu High-Capacity Transit Corridor (HHCTC) project through the Petition Area.

The proposed project has been designed to reduce future residents' reliance on private motorized vehicles through the following measures:

- Ho'opili is the first new project designed to ~~embrace~~ support high-capacity transit (elevated, fixed-guideway) corridor and station(s) (and a possible transit maintenance and storage facility);
- the Petition Area is large enough to be designed and offer a full range of mixed land uses, including a wide range of places of live, work, shop, recreate and learn and will aspire to achieve a job-housing balance;
- Ho'opili is designed to maximize connectivity (transit, pedestrian, bicycle and vehicular) with surrounding streets and communities (including DHHL and UHWO), while minimizing cul-de-sacs and dead-end streets;
- Ho'opili will be designed to take advantage of the relatively flatness of the site and proximity to UHWO by designing streets and grade-separated multi-modal pathways for walking and bicycling; and
- the Petitioner will seek to implement other transportation management and transportation demand management (TDM) strategies (such as requesting that the State/County consider extending or instituting contra-flow of major transportation corridors during a.m. and p.m. peak travel times).

The most important TDM strategy is that Ho'opili is designed to ~~embrace~~ support both rail and bus transit and the project is proposed to have mixed uses over most of the entire Petition Area.

7.5 RATIONALE FOR PROCEEDING WITH THE PROJECT NOTWITHSTANDING UNAVOIDABLE EFFECTS

As noted in Sections 2.1.6 and 5.3.2 of this EIS, the proposed Ho'opili project complies with the *Ewa Development Plan* and is the rationale for proceeding notwithstanding any unavoidable negative effects.

AR00027316

7.6 UNRESOLVED ISSUES

Unresolved issues are regularly associated with projects in the planning and preliminary design phases. This chapter, in compliance with Section 11-200-17(n), HAR, describes the unresolved issues associated with development of the proposed project. Discussion of how such issues will be resolved and what overriding reasons exist for proceeding with the project are listed below.

Honolulu High-Capacity Transit Corridor (HHCTC) Alignment Through Ho'opili. As of this writing, the high-capacity transit corridor alignment through Ho'opili has not been finalized. As previously noted, Ho'opili is being designed to be transit-ready, and the land use plan, while subject to change, has been designed to accommodate a high-capacity transit corridor either along Farrington Highway or diagonally through the project site, with either one or two transit station locations. While the proposed residential unit count will not change, the land use plan will need to be adjusted depending on the final alignment of the high-capacity transit corridor, as the potential for noise impact from an elevated high-capacity transit alignment would likely require taller, higher density residential or industrial uses along the alignment. The final siting of the transit station location(s) will also provide transit-oriented development potentials, which will also cause the plan to be refined, as higher intensity development (and density) will probably be concentrated around the transit station(s). Also unresolved at this time is the location of a possible transit maintenance and storage facility.

State of Hawaii Department of Education (State DOE) School Fair Share Requirements. The Petitioner is currently coordinating with the State DOE regarding the number of schools that will be required for the development of the Ho'opili project. This will be identified as an unresolved issue until the number of schools required is finalized during the EIS process.

Drainage. The Petition Area falls within three different drainage basins. For the portion of the Petition Area within the West Loch drainage basin, it is planned to collect all storm water and route it to an existing detention basin located on the east side of Fort Weaver Road and south of the OR&L railroad tracks. The basin would be expanded to ensure that the water quality storage component of the City and County of Honolulu Standards was achieved. An overflow from the detention basin would discharge to the West Loch of Pearl Harbor. The overflow from the proposed makai detention basin would have to cross Navy property. Permission of the Navy would be required. The concept of the overflow across Navy property is not new and was approved in concept back in the early- to mid-1990's. However, as of this date, the Navy has rejected any considerations to allow increased runoff to cross Navy land. Permission from the Navy needs to be resolved for the overflow option to move forward, otherwise the detention basin will need to be expanded to retain the runoff.

AR00027317

8.0
Consultation

8.0 CONSULTATION

The EIS process and planning of Ho'opili involved communicating with Federal, State, and County agencies, and individuals, private companies, and community organizations, including those listed below.

Federal:

- Army Corps of Engineers
- Navy

State of Hawai'i:

- Governor
- Department of Education
- Department of Hawaiian Home Lands
- Department of Health
- Department of Land and Natural Resource
- Department of Transportation
- Hawaii Community Development Authority
- Land Use Commission
- Office of Planning
- University of Hawai'i – West O'ahu

City and County of Honolulu:

- Mayor
- Board of Water Supply
- Department of Emergency Services
- Department of Environmental Services, Wastewater Management Division
- Department of Planning and Permitting
- Department of Transportation Services

Other Agencies and Individuals:

- Maureen Andrade, Village Park Community Association
- Todd Apo, City Councilmember
- Gary Bautista, 'Ewa Neighborhood Board
- Dick Beamer, Retired Army/Honorary Mayor of 'Ewa Beach
- Scott Belford, HOSEFF Non-Profit
- Darrlyn Bunda, Committee for Balanced Transportation
- Rida Cabanilla, State Representative
- John Condello, Hawai'i Theological Institute
- Charles Djou, City Councilmember
- BJ Dorman, Salvation Army Hawai'i
- Everett Dowling, The Dowling Company

AR00027319

- Will Espero, State Senator
- Kurt Fevella, 'Ewa Neighborhood Board
- John Field, Punahou School
- Mike Fitzgerald, Enterprise Honolulu
- Pearlyn Fukuba, HCDA/Kalaeloa
- Mike Gabbard, State Senator
- Nestor Garcia, City Councilmember
- Frank Genadio, Makakilo Resident, Committee for Balanced Transportation
- Kevin Gilbert, Hawai'i Theological Institute
- Carolyn Golojuch, Makakilo Resident
- Michael Golojuch, Palehua Community Association
- Scotty Gomes, Fellowship of Catholic Men
- Donna Goth, Aina Nui Corporation
- Sharon Har, State Representative
- Teri Ikehara, West Loch Estates President
- Dr. Val Iwashita, 'Iolani School
- Larry G. Jefts, Sugarland Farms
- Brian Kanno, Former State Legislator
- Guy Kidder, Fellowship of Catholic Men
- Walter Kirimitsu, Saint Louis School
- Coby Lynn, 'Ewa Beach Lion Club
- Eileen Lynn, 'Ewa Beach Resident
- Tesha Malama, 'Ewa Beach Resident
- Stephen Meder, UH Center for Smart Building and Community Design
- Dr. Mark Mitchell, Kahi Mohala
- Scott Mitchell, Fellowship of Catholic Men
- Mark Moses, Former State Legislator
- Richard Oshiro, Waipahu Neighborhood Board
- Kimberly Pine, State Representative
- Rodolfo Ramos, 'Ewa Task Force
- Peter Rappa, UH Sea Grant Extension Service
- Frances Rivero, 'Ewa Beach Boys and Girls Club
- Ross Rolirad, Rotary Club
- Lou Salza, ASSETS School
- Dr. James Scott, Punahou School
- Alec Sou, Aloun Farm, Inc.
- Chuck Sted, Hawaii Pacific Health
- Georgette Stevens, West O'ahu Economic Development Association
- Summer Thomson, 'Ewa Beach Boys and Girls Club
- Keith Timson, Makakilo Resident
- Maeda Timson, Kapolei Neighborhood Board
- David Arakawa, Land Use Research Foundation
- Karen Wenke, 'Ewa Resident, 'Ewa Lions, Small Business Person
- Chuck Wheatley, Guardian Angels/Waipahu

AR00027320

- Daniel White, Island Pacific Academy
- Lance Widner, Royal Kunia Community Association
- Stephanie Widner, Royal Kunia Resident
- George Yakowenko, Waipahu Neighborhood Board
- Annette Yamaguchi, Waipahu Business Association
- Linda Young, Kapolei Neighborhood Board, Malanai Iki Association

10.0
Glossary

10.0 GLOSSARY

The following is a list of terms, abbreviations, and acronyms used in the EIS.

A

AAQS	Ambient Air Quality Standards
ADA	Americans with Disabilities Act
ALISH	Agricultural Lands of Importance to the State of Hawaii

B

BOE	State of Hawai'i Board of Education
BWS	City and County of Honolulu Board of Water Supply

C

CFS	Cubic Feet per Second
CIP	Capital Improvement Project
City	City and County of Honolulu
CSH	Cultural Surveys Hawaii, Inc.
CZM	State of Hawai'i Coastal Zone Management Program

D

dBA	A-weighted decibel
DBED&T	State of Hawai'i Department of Business, Economic Development & Tourism
DDC	City and County of Honolulu Department of Design and Construction
DES	City and County of Honolulu Department of Environmental Services
DHHL	State of Hawai'i Department of Hawaiian Home Lands
DOE	State of Hawai'i Department of Education
DOH	State of Hawai'i Department of Health
DOT	State of Hawai'i Department of Transportation
DP	Development Plan
DPA	Development Plan Area
DPR	City and County of Honolulu Department of Parks and Recreation
DPP	City and County of Honolulu Department of Planning and Permitting
DPP TRB	City and County of Honolulu Department of Planning and Permitting, Traffic Review Branch
DTS	City and County of Honolulu Department of Transportation Services

E

EIS	Environmental Impact Statement
EISPN	Environmental Impact Statement Preparation Notice
EMF	Electro Magnetic Fields
EMS	Emergency Medical Services
Ewa DP	Ewa Development Plan

AR00027327

Ewa DPA	Ewa Development Plan Area
F	
F	Fahrenheit
FEIS	Final Environmental Impact Statement
FEMA	Federal Emergency Management Agency
FIRM	Flood Insurance Rate Map
FTE	Full-Time Equivalent
G	
GM	Gallons per Minute
H	
HAR	Hawaii Administrative Rules
HCDCH	State of Hawai'i Housing and Community Development Corporation of Hawaii
HCS	Highway Capacity Software
HECO	Hawaiian Electric Company, Inc.
HFD	City and County of Honolulu Fire Department
HHCTC	Honolulu High-Capacity Transit Corridor Project
HOV	High-Occupancy Vehicle
HPD	City and County of Honolulu Police Department
HRS	Hawaii Revised Statutes
H-1	H-1 Freeway
H-2	H-2 Freeway
J	
JDA	Joint Development Agreement
K	
KCDD	Kalaeloa Community Development District
kV	~~Kilo Volt~~ Kilovolt
L	
LCA	Land Court Award
Ldn	Day-night equivalent sound level measured in dBA
LOS	Level of Service
LOTMA	Leeward Oahu Transportation Management Association
LPA	Locally Preferred Alternative
LSB	Land Study Bureau
LUC	State of Hawai'i Land Use Commission
LUO	City and County of Honolulu Land Use Ordinance
M	
MG	Million Gallons
MGD	Million Gallons per Day
MOS	Minimum Operable Segment
MSL	Mean Sea Level
MSW	Municipal Solid Waste
MVA	Megavolt Amperes
MW	Gross Megawatts

Comments on the Environmental Impact Statement Preparation Notice & Responses

12.0 COMMENTS ON THE ENVIRONMENTAL IMPACT STATEMENT PREPARATION NOTICE AND RESPONSES

The Environmental Impact Statement Preparation Notice (EISPN) was published in the March 8, 2007 issue of the OEQC *The Environmental Notice* and was sent to the agencies, organizations, and individuals listed in the following table. The public comment period on the EISPN was from March 8, 2007 to April 9, 2007. Agencies, organizations, or individuals that submitted comments on the EISPN are listed in bold. Comment and response letters have been reproduced and follow Table 12.1 below.

Table 12.1. EISPN Comment Letters

SUBJECT: HO'OPILI ENVIRONMENTAL IMPACT STATEMENT PREPARATION NOTICE (EISPN)

Dear Mr. Lau:

Thank you for your letter dated April 4, 2007 (your reference number (P) 1073.7). We acknowledge your assessment that this project does not directly affect the Department of Accounting and General Services' projects or existing facilities, and therefore, the department has no comments to offer at this time.

Thank you again for your participation in the Environmental Impact Statement process for this project. Your comments will be included in the Draft EIS.

If you have any questions regarding this project, please do not hesitate to contact me at 521-5631.

Sincerely,

PBR HAWAII

Re: Environmental Impact Statement Preparation Notice (EISPN)
Ho'opili, Ewa, Oahu
Tax Map Key: 9-1-17:04 (portion, 59, and 72; 9-1-18:01 and 04; 9-1-10: 02, 14 (portion), and 15 (portion) and 9-2-02:02, and 9-2-02:01 (portion), 04, 05, 06 and 07

In response to your March 7, 2007, notice, thank you for the opportunity to provide comments on the EISPN for the Ho'opili development. The proposed project would have an area of 1,704 acres including a mixed-use, transit-ready community including: low-medium density residential/live-work, mixed-use medium density residential, mixed-use/high density residential, light industrial mixed-use/business, schools, parks, open space and roads.

We would like to call your attention to: (1) State energy conservation goals; and, (2) energy and resource efficiency and renewable energy and resource development.

1. State energy conservation goals. Project buildings, activities, and site grounds should be designed and/or retrofit with energy saving considerations. The mandate for such consideration is found in Chapter 344, HRS ("State Environmental Policy") and Chapter 226 ("Hawaii State Planning Act"). In particular, we would like to call to your attention HRS 226 18(c) (4) which includes a State objective of promoting all cost-effective energy conservation through adoption of energy-efficient practices and technologies.

   We recommend that you consult the City and County of Honolulu Energy Code early in your project. Hawaiian Electric Company, Inc. may also have suggestions and demand-side management programs that offer rebates for installation of energy efficient technologies.

2. Energy and resource efficiency and renewable energy and resource development. We do not note any proposed covenants to enhance the sustainability of the development, including green architecture, solar water heating and photovoltaic energy for appliances, shading of exterior lighting, and water conservation measures.

   We encourage the parties to this development to make a further commitment to energy and resource efficiency and include a requirement in the Conditions, Covenants, and Restrictions for a development that meets the U.S. Green Building Council's Leadership in Energy and Environmental Design (LEED) Certification. Zero-Net Energy Green Homes should be considered.

Our website (http://www.hawaii.gov/dbedt/info/energy/efficiency/) provides detailed information on guidelines, directives and statutes, as well as studies and reports on aspects of energy efficiency. Please also do not hesitate to contact Carilyn Shon, Energy Efficiency Branch Manager, at telephone number 587-3810, for additional information on LEED, energy efficiency, and renewable energy resources.

Sincerely,

Maurice H. Kaya
Chief Technology Officer

SUBJECT: HO'OPILI ENVIRONMENTAL IMPACT STATEMENT PREPARATION NOTICE (EISPN)

Dear Mr. Kaya:

Thank you for your letter dated April 9, 2007. We offer the following responses to your comments:

1. The project will address the applicable provisions of Chapter 344, Hawaii Revised Statutes (HRS) ("State Environmental Policy") and Chapter 226, HRS ("Hawaii State Planning Act"). Where feasible, project buildings, activities, and site grounds will be designed with energy-saving considerations. Given the natural climate, the project will be suited for the use of renewable energy technologies including photovoltaics. In addition, based on DBEDT's recommendations, Ho'opili's mechanical and electrical consultants, in consultation with its sustainability consultant, will be directed to review the City and County of Honolulu's Energy Code early in the project and to consult with Hawaiian Electric Company, Inc. (HECo) on demand-side management programs that offer rebates for installation of energy-efficient technologies.

2. Please note that sustainability guidelines are being considered for the Ho'opili project. The developer has submitted an application for a Leadership in Energy and Environmental Design (LEED) Neighborhood Design (ND) designation by the U.S. Green Building Council (USGBC) and was placed on the list of LEED ND pilot projects. According to the USGBC website, "The LEED for Neighborhood Design Rating System integrates the principles of smart growth, urbanism, and green building into the first national standard for neighborhood design. LEED certification provides independent, third-party verification that a development's location and design meet accepted high standards for environmentally responsible, sustainable, development. LEED for Neighborhood Design is a collaboration between the U.S. Green Building Council, the Congress for the New Urbanism, and the Natural Resources Defense Council."

Thank you very much for calling our attention to your website which provides detailed information on guidelines, directives, and statutes, as well as studies and reports on aspects of energy efficiency (http://www.hawaii.gov/dbedt/info/energy/efficiency/state).

Thank you again for your participation in the Environmental Impact Statement process for this project. Your comments will be included in the Draft EIS.

If you have any questions regarding this project, please do not hesitate to contact me at 521-5631.

Sincerely,

PBR HAWAII

OFFICE OF THE SUPERINTENDENT

April 10, 2007

Mr. Vincent Shigekuni
PBR HAWAII
ASB Tower, Suite 650
1001 Bishop Street
Honolulu, Hawaii 96813

Dear Mr. Shigekuni:

Subject: Environmental Impact Statement Preparation Notice for Ho'opili, East Kapolei, Ewa District

The Department of Education (DOE) has reviewed the Environmental Impact Statement Preparation Notice (EISPN) for the proposed Ho'opili project in East Kapolei. DOE has met on several occasions with the developer of the project and has had lengthy discussions on the school impacts of almost 12,000 additional residential units. The DOE concurs with the EISPN statement that the total number of public schools that need to be built within the project is not established, pending more definitive data about the proposed housing, but that a minimum of five schools will be required. We expect to continue to meet in the future as more information on the residential units becomes available.

The DOE is concerned with the school enrollment numbers in section 4.9.1 School. The table on page 47 and 48 does not include the middle school and high school serving the Campbell High School complex area. Also, the enrollment figures are not the official figures used by the Facilities Development Branch. In addition, since enrollment projections are updated every year, for every school, it is important to identify the year in which the projections were made. Please contact the Facilities Development Branch to update the enrollment figures for the Draft Environmental Impact Statement.

The DOE has no other comments at this time. We appreciate the opportunity to comment on the EISPN. If you have any questions, please call Heidi Meeker of the Facilities Development Branch at 733-4862.

Very truly yours,

Patricia Hamamoto
Superintendent

SUBJECT: HO'OPILI ENVIRONMENTAL IMPACT STATEMENT PREPARATION NOTICE (EISPN)

Dear Ms. Hamamoto:

Thank you for your letter dated April 10, 2007 (your reference number: PH:jmb). We offer the following responses to your comments:

1. We acknowledge your assessment that the EISPN statement that the total number of public schools that need to be built within the project is not established, pending more definitive data about the proposed housing, but that a minimum of five schools will be required.

2. We acknowledge your concern with the school enrollment numbers in the EISPN. As such, the Facilities Development Branch will be contacted to update the enrollment figures in the Draft Environmental Impact Statement (EIS).

Thank you again for your participation in the Environmental Impact Statement process for this project. Your comments will be included in the Draft EIS.

If you have any questions regarding this project, please do not hesitate to contact me at 521-5631.

Sincerely,

April 3, 2007

Mr. Vincent Shigekuni
PBR Hawaii
ASB Tower, Suite 650
1001 Bishop Street
Honolulu, Hawaii 96813

Dear Mr. Shigekuni:

SUBJECT: Environmental Impact Statement (EIS) Preparation Notice for Hoopili Project, Ewa, Oahu, Hawaii
TMK: (1) 9-1-017: 004 (portion), 059 and 072
(1) 9-1-018: 001 and 004
(1) 9-1-010: 002, 014 (portion) and 015 (portion)
(1) 9-2-002: 001 (portion), 002, 004, 005, 006 and 007

Thank you for allowing us to review and comment on the subject documents. The documents were routed to the various branches of the Department of Health (DOH) Environmental Health Administration. We have the following Clean Water Branch, Hazard Evaluation & Emergency Response Office and General comments.

Clean Water Branch (CWB)

The CWB has reviewed the limited information contained in the subject document and offers the following comments:

1. The Army Corps of Engineers should be contacted at (808) 438-9258 for this project. Pursuant to Federal Water Pollution Control Act (commonly known as the "Clean Water Act" (CWA) Paragraph 401(a)(1), a Section 401 Water Quality Certification (WQC) is required for "[a]ny applicant for Federal license or permit to conduct any activity including, but not limited to, the construction or operation of facilities, which may **result** in any discharge into the navigable waters..." (emphasis added). The term "discharge" is defined in CWA, Subsections 502(16), 502(12), and 502(6); Title 40, Code of Federal Regulations (CFR), Section 122.2; and Hawaii Administrative Rules (HAR), Chapter 11-54.

2. In accordance with HAR, Sections 11-55-04 and 11-55-34.05, the Director of Health may require the submittal a Notice of Intent (NOI) for general permit coverage authorized under the National Pollutant Discharge Elimination System (NPDES). An NOI to be covered by an

NPDES general permit is to be submitted at least 30 days before the commencement of the respective activity. A separate NOI is needed for coverage under each NPDES general permit. The NOI forms may be picked up at our office or downloaded from our website at: http://www.hawaii.gov/health/environmental/water/cleanwater/forms/forms/genl-index.html

a. Storm water associated with industrial activities, as defined in Title 40, CFR, Sections 122.26(b)(14)(i) through 122.26(b)(14)(ix) and 122.26(b)(14)(xi). [HAR, Chapter 11-55, Appendix B]

b. Storm water associated with construction activities, including clearing, grading, and excavation, that result in the disturbance of equal to or greater than one (1) acre of total land area. The total land area includes a contiguous area where multiple separate and distinct construction activities may be taking place at different times on different schedules under a larger common plan of development or sale. **An NPDES permit is required before the commencement of the construction activities.** [HAR, Chapter 11-55, Appendix C]

c. Discharges of treated effluent from leaking underground tank remedial activities. [HAR, Chapter 11-55, Appendix D]

d. Discharges of once through cooling water less than one (1) million gallons per day. [HAR, Chapter 11-55, Appendix E]

e. Discharges of hydrotesting water. [HAR, Chapter 11-55, Appendix F]

f. Discharges of construction dewatering effluent. [HAR, Chapter 11-55, Appendix G]

g. Discharges of treated effluent from recycled water distribution systems. [HAR, Chapter 11-55, Appendix J]

h. Discharges of storm water from a small municipal separate storm sewer system. [HAR, Chapter 11-55, Appendix K]

3. In accordance with HAR, Section 11-55-38, the applicant for an NPDES permit is required to either submit a copy of the new NOI or NPDES permit application to the State Department of Land and Natural Resources, State Historic Preservation Division (SHPD), or demonstrate to the satisfaction of the DOH that the project, activity, or site covered by the NOI or application has been or is being reviewed by SHPD. If applicable, please submit a copy of the request for review by SHPD or SHPD's determination letter for the project.

4. Any discharges related to project construction or operation activities, with or without a Section 401 WQC or NPDES permit coverage, shall comply with the applicable State Water

AR00027347

Quality Standards as specified in HAR, Chapter 11-54.

The Hawaii Revised Statutes, Subsection 342D-50(a), requires that "[n]o person, including any public body, shall discharge any water pollutants into state waters, or cause or allow any water pollutant to enter state waters except in compliance with this chapter, rules adopted pursuant to this Chapter, or a permit or variance issued by the director."

If you have any questions, please contact the Engineering Section, CWB, at 586-4309.

Hazard Evaluation & Emergency Response Office (HEER)

As a common practice, lands formerly used for sugarcane production are now being developed into communities where residential home, schools and commercial businesses are being constructed. Chemicals associated with the sugarcane industry persist in soils today and may be a threat to public health and the environment. Elevated arsenic levels were discovered in soil at formerly sugarcane production areas on the islands. The HEER Office has identified former sugarcane production areas for assessment throughout the state and plans to work with property owners to conduct environmental assessment to identify and address elevated soil arsenic levels prior to finalizing development plans for the properties

The parcels listed in the EIS Preparation Notice for the Hoopili Project were used for sugarcane production and should be assessed for chemicals associated with the sugarcane industry. Environmental assessments conducted on adjacent parcels have identified chemicals of concern. The developers of the Hoopili Project and the DOH have met to discuss addressing potential risks at the site through environmental assessments. Section 1.9 of the EIS Preparation Notice should include an investigation of hazardous substances. If contaminants are found at elevated levels, then additional assessment is needed to determine potential risks and the need for remedial action. Removal or remedial plans must comply with Chapter 128D, Environmental Response Law, HRS, and Title 11, Chapter 451, HAR, State Contingency Plan.

If you have any questions, please contact HEER Office at 586-4250.

General

We strongly recommend that you review all of the Standard Comments on our website: www.state.hi.us/health/environmental/env-planning/landuse/landuse.html. Any comments specifically applicable to this project should be adhered to.

If there are any questions about these comments please contact Jiacai Liu with the Environmental Planning Office at 586-4346.

Sincerely,

KELVIN H. SUNADA, MANAGER
Environmental Planning Office

Attn: Mr. Jiacai Liu

SUBJECT: HO'OPILI ENVIRONMENTAL IMPACT STATEMENT PREPARATION NOTICE (EISPN)

Dear Mr. Sunada:

Thank you for your letter dated April 3, 2007 (your reference number: EPO-07-060). We offer the following responses to your comments:

Clean Water Branch (CWB)

1. The Army Corps of Engineers was provided a copy of the EISPN but was unable to determine whether a Federal permit (including a Department of Army permit) is required for this project. An application for jurisdictional determination will be submitted to the Army Corps of Engineers.

2. As stated in the EISPN, a National Pollutant Discharge Elimination System (NPDES) Permit(s) will be required for the project.

Hazard Evaluation & Emergency Response Office (HEER)

As you may be aware, the developer has been coordinating with the Department of Health (DOH) to address potential risks at the project site. As we understand it, since May of 2007, HEER's interest is now in the presence (or absence) of dioxin, and may be concerned with arsenic if site conditions warrant.

General

4. As recommended, the Standard Comments on the Department of Health website (http://www.state.hi.us/health/environmental/env-planning/landuse/landuse.html) have been reviewed and will be adhered to as applicable.

Thank you again for your participation in the Environmental Impact Statement process for this project. Your comments will be included in the Draft EIS.

If you have any questions regarding this project, please do not hesitate to contact me at 521-5631.

Sincerely,

PBR HAWAII

Vincent R. Shigekuni

Dear Messrs. Bruhl, Shigekuni and Ching:

The Office of Environmental Quality Control has reviewed the final environmental assessment for the Hoopili Project, Tax Map Key 9-1-17:04 (portion; 59, and 72; 9-1-18:01 and 04; 9-1-10: 02, 14 (portion), and 15 (portion) and 9-2-02:02, and 9-2-02:01 (portion), 04, 05, 06, and 07, in the judicial district of 'Ewa. The Office of Environmental Quality Control offers the following comments for your consideration and response.

1. ***Surface Water Quality Hydrologically Downgradient of the Project Site:*** The final environmental assessment discusses groundwater resources and hydrology in Section 3.5, but needs to discuss the quality of surface waters downgradient from the project and what kinds of direct, indirect or cumulative impacts the project will have on surface water quality. Please discuss this in the draft environmental impact statement.
2. ***Biological Survey:*** In an environmental impact statement in Ewa for former sugar cane lands, several colonies of endangered plants were found. Please include in the draft environmental impact statement a biological survey of the project site.
3. ***Native and Indigenous Vegetation for Post Construction Landscaping:*** Please consider planting the graded and disturbed areas of the project site with native and indigenous vegetation after construction has been completed. Please see http://www.state.hi.us/health/oeqc/guidance/sustainable.htm.

Thank you for the opportunity to comment. If there are any questions, please call Mr. Leslie Segundo, Environmental Health Specialist, at (808) 586-4185.

Sincerely,

Genevieve Salmonson

SUBJECT: HO'OPILI ENVIRONMENTAL IMPACT STATEMENT PREPARATION NOTICE (EISPN)

Dear Ms. Kealoha:

Thank you for the letter dated March 30, 2007. We offer the following responses to your comments:

1. Please note that a discussion of the quality of surface waters downgradient from the project and what kinds of direct, indirect, or cumulative impacts the project will have on surface water quality will be included in the Draft Environmental Impact Statement (EIS).

2. As requested, a biological survey of the project site will be included and summarized in the Draft EIS.

3. Thank you for calling our attention to your website which establishes guidelines for sustainable building design in Hawai'i (http://www.state.hi.us/health/oeqc/guidance/sustainable.htm). Native and indigenous vegetation will be considered in the selection of plan materials.

Thank you again for your participation in the Environmental Impact Statement process for this project. Your comments will be included in the Draft EIS.

Dear Mr. Shigekuni:

SUBJECT: Chapter 6E-8 Historic Preservation Review –
Environmental Impact Statement Notice of Intent (EISPN), Ho'opili Project
Honouliuli Ahupua'a, 'Ewa District, Island of O'ahu
TMK: (1) 9-1-various plats & parcels, 9-2-various plats & parcels

Thank you for submitting the aforementioned document, which we received on March 8, 2007. The proposed undertaking consists of the reclassification of approximately 1554 acres of land from the Agricultural District to the Urban District.

As stated in your document, "[a] preservation plan and archaeological monitoring plan will be prepared and submitted to SHPD for their review and approval." We look forward to reviewing these documents, and recommend that you include all relevant historic-preservation documents, including all final reports and SHPD acceptance letters, in the draft EIS.

We look forward to reviewing the Draft EIS.

Please contact Mr. Adam Johnson (O'ahu Assistant Archaeologist) at (808) 692-8015 if you have any questions or concerns regarding this letter.

April 9, 2007

Mr. Vincent Shigekuni
PBR Hawaii & Associates, Inc.
ASB Tower, Suite 650
1001 Bishop Street
Honolulu, Hawaii 96813

Dear Mr. Shigekuni:

Subject: Ho'opili
D. R. Horton – Schuler, LLC
EIS Preparation Notice for LUC Petition No. A06-771 Filing
TMK: 9-1-17: 04 (portion), 59, and 72; 9-1-18: 01 and 04;
9-1-10: 02, 14 (portion), and 15 (portion) and 9-2-02: 02, and
(portion), 04, 05, 06 and 07

Thank you for providing the notification on the subject proposed land development project. We have the following initial comments as an interested party:

1. The site of the project is not directly under aircraft flight paths for Kalaeloa Airport or Honolulu International Airport. However, the developer and prospective residents/occupants should be advised and made aware that single-event noise may occur from potential overflights of aircraft or under certain weather/atmospheric conditions, particularly from aircraft approaching or departing Kalaeloa Airport.

2. The development of the project will have a significant traffic impact on our highway facilities in the Kapolei-Ewa region. The developer should prepare and submit a traffic impact analysis report (TIAR). The TIAR should cover both project traffic impacts and the cumulative traffic impacts to the community and region, which the project will be contributing to, including the existing and future road network in the area. Accesses and connections to any State highway also need to be identified. The TIAR should provide recommended and required transportation mitigation measures and roadway improvements to address the impacts, including the developer's participation in and contribution to provide the mitigation measures and improvements. We will need to review and approve the TIAR.

AR00027354

3. We should be included in agency reviews and approvals of the drainage plans for the subject project.

4. Any construction work by or for the subject project that can affect a State highway and/or can occur within or adjoin a State highway right-of-way will need our prior review and approval.

We will defer any other additional comments on the subject project until we receive and have the opportunity to review more information on the project. We would appreciate receiving at least five (5) copies of any report or document on the project for review by our operating divisions.

We appreciate the opportunity to provide our comments.

Very truly yours,

BARRY FUKUNAGA
Interim Director of Transportation

State of Hawai'i
Department of Transportation
869 Punchbowl Street
Honolulu, Hawai'i 96813-5097

SUBJECT: HO'OPILI ENVIRONMENTAL IMPACT STATEMENT PREPARATION NOTICE (EISPN)

Dear Mr. Morioka:

Thank you for the letter dated April 9, 2007 (your reference number: STP 8.2450). We offer the following responses to your comments:

1. We acknowledge that single-event noise may occur from potential overflights of aircraft or under certain weather/atmospheric conditions, particularly from aircraft approaching or departing Kalaeloa Airport.

2. As suggested a traffic impact analysis report will be prepared and submitted to the Department of Transportation (DOT) for review and approval. The traffic consultant has met and/or spoken with various DOT staff to confirm the intersections to be analyzed and the general methodology to be used in estimating trip generation.

3. As requested, the DOT will be included in agency reviews and approvals of the drainage plans for the subject project.

4. We acknowledge that any construction work by or for the subject project that can affect a State highway and/or can occur within or adjoin a State highway right-of-way will need prior DOT review and approval.

5. We acknowledge that the DOT will defer any other additional comments on the subject project until additional information regarding the project is provided.

6. Please be assured that your agency will receive at least five (5) copies of the Draft EIS and at least five (5) copies of any additional reports and/or documents as soon as they are available for review.

Thank you again for your participation in the Environmental Impact Statement process for this project. Your comments will be included in the Draft EIS.

RE: Request for comment on an Environmental Impact Statement Preparation Notice for the proposed Ho'opili project located in East Kapolei; TMKs: 9-1-017:004, 059 and 072; 9-1-018:001 and 004; 9-1-010:002, 014 and 015; 9-2-002:002; and 9-2-002:001, 004, 005, 006 and 007

Dear Vincent Shigekuni,

The Office of Hawaiian Affairs (OHA) is in receipt of your request for comments on the above-referenced proposal, which would allow for the reclassification of approximately 1,554 acres of land from the Agricultural District to the Urban District. We apologize for the delayed response and offer no comments at this time.

Thank you, however, for the opportunity to comment initially. OHA looks forward to the opportunity to review the forthcoming Draft Environmental Impact Statement in greater detail. If you have further questions or concerns, please contact Heidi Guth at (808) 594-1962 or e-mail her at heidig@oha.org.

Sincerely,

April 10, 2007

Mr. Vincent Shigekuni
PBR Hawaii
ASB Tower, Suite 650
1001 Bishop Street
Honolulu, Hawaii 96813

Dear Mr. Shigekuni:

Thank you for the opportunity to provide comments on DR Horton's Ho'opili project. This project plans to add a significant number of homes in a region that has seen a great population increase in a short amount of time. However, infrastructure has not kept up with development.

I support the Ho'opili project only insofar as it includes plans to adequately address the issue of infrastructure including, but not limited to, roads, schools, and the water and sewer system.

While the project is in its early stages, it is imperative that the infrastructure be built concurrently and not after the construction of the housing. This project will have a great effect on the district I represent and I look forward to being able to provide further comments as the project proceeds through the various stages of development.

Once again, thank you for the opportunity to provide comments on this matter. If you have any questions, please do not hesitate to contact me.

File No. POH-2006-233-2

Vincent Shigekuni
PBR Hawaii
ASB Tower, Suite 650
Honolulu, Hawaii 96813

Dear Mr. Shigekuni:

This is in response to your letter dated March 7, 2007 for comments for an environmental impact statement (EIS) for the proposed Ho'opili development in East Kapolei, 'Ewa District, O'ahu Island, Hawaii, various TMKs. We have reviewed the information you submitted with respect to the Corps' authority to issue Department of the Army (DA) permits pursuant to Section 10 of the Rivers and Harbors Act (RHA) of 1899 (33 USC 403) and Section 404 of the Clean Water Act (CWA) (33 USC 1344).

Based on the information provided in the EIS preparation notice (EISPN) prepared on behalf of the applicant, D.R. Horton – Schuler, LCC, we are unable to provide a determination whether a DA permit would be required. A DA permit will be required for any work in navigable waters of the U.S. or activities that involve the placement or discharge of dredged or fill material into waters of the U.S. Please send us a copy of the draft EIS, project plans, or for review. The draft EIS should identify any water resources, including wetlands, which may be affected by the proposed project.

If you have any questions regarding this information request, please contact Ms. Joy Anamizu by phone at 808-468-7023 or by electronic mail at joy.n.anamizu@usace.army.mil and reference the file number above in future correspondence.

Sincerely,

George P. Young, P.E.

SUBJECT: HO'OPILI ENVIRONMENTAL IMPACT STATEMENT PREPARATION NOTICE (EISPN)

Dear Mr. Young:

Thank you for your letter dated May 7, 2007 (your reference number: POH-2006-233-2). We acknowledge that the U.S. Army Engineer District is unable to provide a determination whether a Department of the Army permit pursuant to Section 10 of the Rivers and Harbors Act of 1889 and Section 404 of the Clean Water Act would be required for the proposed project. An application for jurisdictional determination will be submitted to the Army Corps of Engineers. As requested, a copy of the Draft EIS, identifying any water resources, including wetlands, which may be affected by the proposed project, will be sent to the U.S. Army Engineer District for review.

Thank you again for your participation in the Environmental Impact Statement process for this project. Your comments will be included in the Draft EIS.

If you have any questions regarding this project, please do not hesitate to contact me at 521 5631.

Dear Mr. Shigekuni:

Subject: Your Letter Dated March 7, 2007 Regarding the Environmental Impact Statement Preparation Notice for Ho'opili

Thank you for the opportunity to comment on the proposed project.

We have the following comments to offer:

1. A potable and non-potable water master plan of the entire parcel should be submitted for our review and approval. The master plan should include the water requirements and proposed infrastructure facilities. The master plan should show that the facilities are able to provide water service and fire protection in accordance with our Water System Standards.

2. The developer will be required to install the necessary water system improvements to serve the proposed development. The construction drawings should also be submitted for our review and approval.

When water is made available, the applicant will be required to pay our Water System Facility Charges for resource development and transmission.

If you have any questions, please contact Robert Chun at 748-5440.

Dear Mr. Shigekuni:

Subject: Environmental Impact Statement Preparation Notice
Ho'opili

Thank you for providing us with the opportunity to review and comment on the Ho'opili Environmental Impact Statement (EIS) Preparation Notice.

The draft EIS should provide more detailed information on the types of affordable housing that will be developed in terms of unit size, types and pricing. Our customary recommendation is to require that no less than 30 percent of the total number of dwelling units in the project must be affordable to households with incomes not exceeding 120 percent of the median income for Honolulu, and no less than 10 percent of the total number of dwelling units being affordable to household's with incomes not exceeding 80 percent of the median income. Given the severe shortage of affordable rental housing our community currently faces, it is our preference that the unit mix include an affordable rental housing component that could be developed by a nonprofit developer or nonprofit/for profit partnership using existing affordable housing programs such as the low income housing tax credit program. We would also ask that consideration be given to set aside a few house lots for the development of group homes for persons with special needs. As a matter of policy, the City & County of Honolulu promotes the dispersal of housing for persons with special needs throughout the community.

We appreciate your consideration of these comments, and we look forward to reviewing the draft EIS when it becomes available. Questions regarding this matter may be directed to Mr. Randy Wong at 768-7747.

Sincerely,

Deborah Kim Morikawa
Director

Ms. Deborah Kim Morikawa, Director
City & County of Honolulu
Department of Community Services
715 South King Street, Suite 311
Honolulu, Hawai'i 96813

SUBJECT: HO'OPILI ENVIRONMENTAL IMPACT STATEMENT PREPARATION NOTICE (EISPN)

Dear Ms. Morikawa:

Thank you for your letter dated March 20, 2007. We have reviewed your letter and offer the following responses to your comments.

As noted in the EISPN, "The Project may provide up to 11,750 residential units in a variety of housing types. D.R. Horton is aware of the current City and County of Honolulu affordable housing requirements (30 percent of the total number of units) and is prepared to price up to 30 percent of the total number of units developed on-site as affordable. In addition to home ownership opportunities, the project will provide commercial, educational, and recreational opportunities for residents."

While it is very early in the development process, with the first homes not envisioned for sale until 2012, pricing will be based on then-prevailing County rules and market conditions.

As previously noted, the project is in the planning process so there may be an opportunity to identify a few house lots throughout the proposed project for the development of group homes for persons with special needs. Thank you again for your participation in the Environmental Impact Statement process. If you have any questions regarding this project, please do not hesitate to contact me at 521-5631.

Sincerely,

Dear Mr. Shigekuni:

Subject: Environmental Impact Statement Preparation Notice
Hoopili, Oahu, Ewa

Thank you for giving us the opportunity to comment on the above project.

The Department of Design and Construction (DDC) has the following comments:

- DDC recommends that the developer meet with City officials from the Department of Planning and Permitting, Department of Design and Construction, and Department of Parks and Recreation at an early stage in the development's planning process to develop a conceptual plan for overall park development which is acceptable and appropriate.

- On page 23 of the Environmental Impact Statement Preparation Notice (EISPN), the authors state that their proposed neighborhood parks would be one to two acres in size. Public dedicated parks of such a small size are not likely to be acceptable to the City. Although we support the goal of locating parks within walking distance of their users (up to 1/2 mile), the City's standard for public neighborhood parks is four to six acres to accommodate such land-intensive uses as ballfields, play courts, play equipment, etc. Privately built and maintained neighborhood parks of the proposed size might be acceptable for receiving credit for park dedication purposes, provided the parks are developed in an appropriate way useful to the community. The developer should also consider possibly co-locating parks adjacent to public schools.

- The proposed development borders Farrington Highway which is a transportation facility on the Oahu Regional Transportation Plan (ORTP).

AR00027362

This facility has been determined to be an integral transportation facility in the Ewa Plains, and is planned for future widening between Fort Weaver Road and the proposed North-South Road; in addition, it is also identified in the MOS alignment for the Transit project. The Farrington Highway widening is an integral part of the Oahu Regional Transportation Plan and is needed to provide improved regional circulation. The Hoopili development should provide improvements to the existing Farrington Highway to accommodate the future traffic volume expected to be generated from the development.

- DDC would appreciate receiving copies of the draft and final EIS documents when published.

Should you have any questions, please contact Craig Nishimura, Deputy Director, at 768-8481.

Very truly yours,

Eugene C. Lee, P.E.
Director

SUBJECT: HO'OPILI ENVIRONMENTAL IMPACT STATEMENT PREPARATION NOTICE (EISPN)

Dear Mr. Lee:

Thank you for your letter dated April 3, 2007. We offer the following responses to your comments:

1. The developer will meet with City officials from the Department of Planning and Permitting, Department of Design and Construction, and Department of Parks and Recreation (DPR) at an early stage in the development's planning process to develop a conceptual plan for overall park development which is acceptable and appropriate.

2. Thank you for the information on neighborhood parks. We realize that using DPR's terminology, the one to two acre parks should be described as "mini-parks" and not "neighborhood parks." We would greatly appreciate the opportunity to more fully describe our preliminary concepts for these mini-parks with you in the near future

3. We acknowledge that the proposed development borders Farrington Hwy which is a transportation facility on the Oahu Regional Transportation Plan (ORTP), and therefore, concur that the widening of Farrington Highway is an integral part of the ORTP and is needed to provide improved regional circulation. The developer will coordinate with DDC regarding the expansion of the right-of-way for the City's planned widening of Farrington Highway, as well as improvements to the highway (such as turning lanes) which are needed to mitigate traffic that can be directly attributed to the proposed development.

4. Please be assured that DDC will be sent a copy of the Draft EIS.

Thank you again for your participation in the Environmental Impact Statement process for this project. Your comments will be included in the Draft EIS.

1001 Bishop Street
Honolulu, Hawaii 96813

Dear Mr. Shigekuni:

Subject: **Environmental Impact Statement Preparation Notice (EISPN), Hoopili**

Thank you for the opportunity to review and comment on the subject EISPN dated January 2007.

The EISPN proposes to reclassify 1,553.844 acres of land from Agricultural District to Urban District. Future development will include a network of streets and bikeways with the required storm drainage improvements. The City and County maintenance resources will need to be expanded for the additional infrastructure. The Ewa region is experiencing tremendous growth putting a strain on resources that maintain the accompanied improvements.

Accordingly, we request any future Draft Environmental Impact Statement (DEIS) include a maintenance analysis which anticipates the labor, equipment and materials needed to maintain the proposed infrastructure to a recognized standard.

Also, maintenance jurisdiction of the proposed bikeways should be addressed in the DEIS. Bikeway facilities not located with dedicable roadways should be privately-owned and maintained by the community association.

Should you have any questions, please call Charles Pignataro of the Division of Road Maintenance, at 484-7697.

Sincerely,

Laverne Higa, P.E.
Director and Chief Engineer

Attn: Mr. Charles Pignataro

SUBJECT: HO'OPILI ENVIRONMENTAL IMPACT STATEMENT PREPARATION NOTICE (EISPN)

Dear Mr. Nishimura:

Thank you for the letter dated April 13, 2007 (your reference number: DRM 07-312). We have reviewed your letter and offer the following responses to your comments.

1. As you kindly offered, we spoke with staff at your department regarding the request for a maintenance analysis. The Draft EIS will include an economic and fiscal impact analysis that should describe the impact of the project on County resources and how anticipated revenues may or may not offset maintenance costs.

2. As recommended, maintenance jurisdiction of the proposed bikeways will be addressed in the Draft EIS. Bikeway facilities not located within dedicable roadways will be privately-owned and maintained by a community association(s).

Thank you again for your participation in the Environmental Impact Statement process for this project. Your comments will be included in the Draft EIS.

If you have any questions regarding this project, please do not hesitate to contact me at 521 5631.

Sincerely,

PBR HAWAII

Mr. Vincent Shigekuni, Vice President
PBR Hawaii
ASB Tower, Suite 650
1001 Bishop Street
Honolulu, Hawaii 96813

Dear Mr. Shigekuni:

Subject: Environmental Impact Statement Preparation Notice for the Proposed Ho'opili Project, Tax Map Key: 9-1-017:004 (por.), 059 and 072; 9-1-018:001 and 004; 9-1-010:002, 014 (por.), and 015 (por.); 9-2-002:001, 9-2-002:002, 004, 005 and 007

We have reviewed the subject project and offer the following comments:

1. Section 1.0 Introduction

   On Page 1 of the Introduction, one (1) of the Tax Map Key parcels listed is 9-2-02:01 (portion). However, TMK: 9-2-02:01 (portion) is not listed on Page 2, nor identified in Figures 1, 2, 2.1, 2.2, and 3. Additionally, this same parcel is not reflected in Table 1 on Page 3. If TMK: 9-2-02:01 (portion) is part of the proposed project site or Petition area, it needs to be included where appropriate in the Draft Environmental Impact Statement (DEIS). Also, please indicate the proposed uses and zoning in Table 1.

   On Page 2 of the Introduction, the "Existing Zoning Designation" states that the current zoning is "AG-1 (Agricultural)." Our records indicate that certain parcels (TMK: 9-1-10:14 (portion) and 15 (portion)) within the "non-petition area" are identified as having both AG-1 Restricted Agricultural District and F-1 Military and Federal District zoning. We recommend that the DEIS reflect the following:

AR00027366

- Revise the term "AG-1 (Agricultural)" to "AG-1 Restricted Agricultural District."

- Provide a zoning map(s) and table to identify the zoning for all parcels (within and outside the petition area) of land. If none of the parcels are zoned F-1 Military and Federal District, then it would be helpful for the new zoning map(s) to show how the proposed parcels are not included in the F-1 areas.

- To supplement Table 1, it would be helpful to revise Section 1.4 by modifying the existing TMK maps or inserting a new map to graphically show the landowners involved.

- Land Use Ordinance (LUO). The discussion of the LUO should also indicate how much of the 1,704.265-acre project area is proposed to be rezoned.

2. Compliance with the State of Hawaii and City and County of Honolulu Environmental Laws

The DEIS should discuss how the proposed action supports the City's General Plan.

With respect to the Ewa Development Plan, we recommend that the DEIS provide graphic and narrative information on how the proposed action fulfills the policy of a network of open space and greenways (Section 2.2.3). Specifically, the DEIS should focus on how the proposal:

- Utilizes a system of linear greenbelts to connect to existing communities.
- Utilizes landscaped buffers and other forms of open space to create a separate identity for the Ho'opili community.
- Meets or exceeds the Ewa DP's minimum requirement of two (2) acres of park space per 1,000 residents
- Considers potential opportunities for co-location of parks with elementary schools; and
- Creates accessible pathways from surrounding streets to facilitate pedestrian and bicycle access to all features in parks (Section 3.3).

The DEIS should discuss how Ho'opili will implement the Ewa DP policies, principles, and guidelines pertaining to planned residential communities (Section 3.6.3); and industrial centers (Section 3.7.3).

The DEIS should provide graphic and narrative information on how the proposed action supports the Ewa DP's general policies pertaining to higher density housing along the transit corridor, transit-oriented streets and pedestrian and bicycle travel, with particular emphasis on accessibility to reach neighborhood

destinations via non-automotive modes of travel (Section 3.6.3.1). The DEIS should also address how the project conforms to the guidelines for a circulation system planned for Ho'opili and how it will be integrated with existing and future developments such as West Loch Estates, Ewa Villages, University of Hawaii (UH) West Oahu, and DLNR and DHHL projects (Section 3.6.3.2). The discussion on circulation should be a component of the project master plan that the applicant will have to prepare as a requirement for "significant zone changes" (Section 5.4.2).

The Conceptual Land Use Map (Figure 6) shows several areas throughout the petition area proposed for business/commercial use. The DEIS should focus on how the proposed business/commercial use is consistent with the Ewa DP's general policies, planning principles, and guidelines pertaining to planned commercial centers (Section 3.7.1). This discussion should also focus on pedestrian and bicycle accessibility (Section 3.7.1.2).

The DEIS should explain how Ho'opili implements the Ewa DP's policies, principles, and guidelines for transportation systems (Section 4.1). The DEIS should focus on how the proposed action supports the development of a comprehensive roadway network and a transit-oriented community street system.

The DEIS should also provide graphic and narrative information on the planned high-capacity transit corridor, including the location of the stations planned on the North-South Road adjacent to the future UH West Oahu campus and on Farrington Highway. A park and ride facility should also be considered at one (1) of the transit stations to increase convenience, accessibility, and encourage ridership. The DEIS should explain that the City has identified Parcel B as a possible site for a maintenance facility to serve the planned high-capacity transit corridor.

The DEIS should also explain how the proposed action supports the Ewa DP's policies, principles, and guidelines pertaining to water allocation system development (Section 4.2); drainage systems (4.6); and school facilities (Section 4.7).

The Ewa DP's Open Space Map shows panoramic makai views from the H-1 Freeway across Parcel B, and views across Parcel B from Fort Weaver Road. The DEIS should discuss how the proposed action impacts these panoramic views.

The Ewa DP's Public Facilities Map shows a proposed bike path along the North-South Road. This proposed bike path should be considered in the refinement of the Conceptual Land Use Plan since it provides an important link between the proposed project and UH West Oahu, and neighboring communities.

AR00027367

3. Section 2.0 Description of the Project

   The list of current tenants and existing land uses listed in Table 2, Section 2.1.2 of the EISPN should be supplemented by a map in the DEIS showing where these tenants are currently leasing land in the project area.

4. Section 3.0 Assessment of the Existing Natural Environment, Potential Impacts, and Mitigation Measures

   Section 3.4, states that land leases will be withdrawn in phased and "as needed basis." We recommend that the DEIS and agricultural impact assessment report explain what will happen to these tenants after their leases are withdrawn.

   Page 31, paragraph 3 states that a very small portion of parcel C is in Zone AE and X. We recommend that the applicant verify if a portion of parcel C is in Zone XS and AEF as our records indicate.

5. Section 4.0 Assessment of the Existing Human Environment, Potential Impacts and Mitigation Measures

   The term "Public Transit Authority" mentioned in the last paragraph on Page 40 should be revised to "Oahu Transit Service." The Oahu Transit Service is a private company hired by the City and County of Honolulu to operate TheBus that provides public transit for Oahu, including the routes mentioned on Page 40.

   The DEIS should indicate the existing flows being treated at the Honouliuli Wastewater Treatment Plant (WWTP) and any improvements to the WWTP needed to accommodate future wastewater demand. The preliminary Wastewater Collection Master Plan should also include figures for wet-weather flows.

   Section 4.8.4 of the EISPN mentions that the project area is within the Kaloi, Honouliuli Stream, and West Loch drainage basins. It would be very helpful if a map showing these drainage basins in relation to the project area can be included in the DEIS.

   Section 4.9.3 of the EISPN discusses health care and hospital facilities. We recommend that the DEIS expand this section by discussing emergency medical service resources that will be needed to serve Ho'opili. We recommend that the Department of Emergency Services be added to the list consulted parties in Section 6.0.

Should you have any questions, please contact Tim Hata of our staff at 768-8043.

Very truly yours,

Henry Eng, FAICP, Director
Department of Planning and Permitting

SUBJECT: HO'OPILI ENVIRONMENTAL IMPACT STATEMENT PREPARATION NOTICE (EISPN)

Dear Mr. Eng:

Thank you for your letter dated May 1, 2007 [your reference number: 2007/ELOG-658; 2007/GEN-8 (TH)]. We have reviewed your letter and offer the following responses to your comments.

1. Section 1.0 Introduction.

   a. Please note that TMK:9-2-02:01 (portion) is not part of the proposed project site or Petition Area, and as such, revisions will be made in the Draft EIS.

   b. AG-1 (Agricultural) will be revised to AG-1 Restricted Agricultural District in the Draft EIS.

   c. A zoning map and table identifying the zoning for all parcels (within and outside the petition area) of land will be included in the Draft EIS.

   d. A map identifying current land ownership in relation to the proposed project, will be included in the Draft EIS.

   e. The Draft EIS will note that 1,555.145 acres will need to be rezoned.

2. Compliance with the State of Hawai'i and City and County of Honolulu Environmental Laws.

   a. A discussion of how the proposed project supports the City's General Plan will be included in *Section 5.3.1, General Plan* of the Draft EIS.

   b. As recommended, the Draft EIS will provide graphic and narrative information on how the proposed action fulfills the policy of a network of open space and greenways (Section 2.2.3 of the Ewa DP).

   c. The Draft EIS will discuss how the project will implement the Ewa DP policies, principles, and guidelines pertaining to planned residential communities and industrial centers (Sections 3.6.3 and 3.7.3 of the Ewa DP).

   d. The Draft EIS will provide graphic and narrative information on how the proposed action supports the Ewa DP's general policies pertaining to higher density housing along the transit corridor, transit-oriented streets, and pedestrian and bicycle travel, with particular emphasis on accessibility to reach neighborhood destinations via non-automotive modes of travel (Section 3.6.3.1 of the Ewa DP). In addition, the Draft EIS will address how the project conforms to the guidelines for a circulation system planned for Ho'opili and how it will be integrated with existing and future developments (Section 5.4.2 of the Ewa DP). A project master plan which will include a transportation master plan will be prepared and included in the Zone Change permit application.

   e. The Draft EIS will include discussion on how the proposed business/commercial use is consistent with Ewa DP's general policies, planning principles, guidelines pertaining to planned commercial centers (Section 3.7.1 of the Ewa DP), and pedestrian and bicycle accessibility (Section 3.7.1.2 of the Ewa DP).

   f. The Draft EIS will include discussion of how the project will implement the Ewa DP's policies, principles, and guidelines for transportation systems (Section 4.1 of the Ewa DP).

   g. The Draft EIS will include a map and narrative information on the planned high-capacity transit corridor, including the location of the transit stations planned on the North-South Road and Farrington Highway. D.R. Horton has been in coordination with area developers and it is our understanding that a park and ride facility is being considered at one of the transit stations closest to UHWO, the Kroc Center and Kapolei Parkway to increase convenience, accessibility, and encourage ridership. It is acknowledged that Parcel B is one of two sites along the transit corridor being considered for a potential rail maintenance and storage facility.

   h. The Draft EIS will explain how the proposed action supports the Ewa DP's policies, principles and guidelines pertaining to water allocation system development (Section 4.2 of the Ewa DP), drainage systems (Section 4.6 of the Ewa DP) and school facilities (Section 4.7 of the Ewa DP).

   i. The Draft EIS will include a discussion of how the proposed action impacts these panoramic views.

   j. The Draft EIS will include a Conceptual Regional Public Facilities and Bikeway Master Plan for East Kapolei that was developed with UHWO and DHHL. The proposed bike path and North-South Road is shown as being integral to providing bicycle and pedestrian connectivity to planned bike and multi-modal paths within the proposed project, UHWO and DHHL.

3. Section 2.0 Description of the Project.

   a. A map depicting where current tenants are currently leasing land in the project area, to serve as a supplement to Table 2, will be included in the Draft EIS.

AR00027369

4. Section 3.0 Assessment of the Existing Natural Environment.

   a. The fact that current agricultural operations will eventually have to be phased out to other locations off-site will be addressed in the agricultural impact analysis report and Draft EIS.

   b. As recommended, we have reviewed the November 20, 2000 Flood Insurance Rate Map (Number 15003C0220) and was not able to find any references to Zone AEF and XS on the entire map or the adjoining map to the south (Number 15003C0220). So unless directed otherwise, we will limit our references to flood zones A, AE, X and D.

5. Section 4.0 Assessment of the Existing Human Environment.

   a. The term "Public Transit Authority" will be revised to "Oahu Transit Services" in the Draft EIS.

   b. Based on average daily flows, the Honouliuli Wastewater Treatment Plant (WWTP) has a primary treatment capacity of 38 million gallons per day (MGD), with future plans to expand to 51 MGD. The facility has an existing flow of 27 MGD. The Ho'opili project will generate additional flow that must be treated at the Honouliuli WWTP. To mitigate the additional burden, the project will participate in the Wastewater System Facility Charge (WSFC) program and contribute funds (based on building permits) to expand the treatment plant. Preliminary contact with the City and County of Honolulu, Department of Environmental Services has indicated that the sewer system has the capacity to accommodate the Project with a build-out beginning in four to six years and ending 15 to 20 years after. The Wastewater Collection Master Plan includes figures for wet-weather flows

   c. A map depicting the Kalo'i Gulch, Honouliuli Stream, and West Loch drainage basins in relation to the project area is shown in Figure 4 of the Drainage Master Plan included as an appendix in the Draft EIS.

   d. The Draft EIS will include a discussion of emergency medical service resources that will be needed to serve the Ho'opili project. As recommended, the Department of Emergency Services will be added to the list of consulted parties.

Thank you again for your participation in the Environmental Impact Statement process for this project. Your comments will be included in the Draft EIS.

If you have any questions regarding this project, please do not hesitate to contact me at 521 5631.

Sincerely,

PBR HAWAII

Dear Mr. Shigekuni:

Subject: Ho'opili

Thank you for your letter of March 7, 2007, requesting our review of and comments on the Environmental Impact Statement (EIS) Preparation Notice for the subject project.

We have the following comments for your consideration as you prepare the draft EIS:

1. The disposition of the roadways within the project should be noted in the document.

2. We look forward to continuing the close coordination that has occurred between the subject project and our Honolulu High-Capacity Transit Corridor Project.

3. The last paragraph on Page 40 of the EIS Preparation Notice describes the existing City bus system in the project area. The second sentence should be revised to delete the reference to the Public Transit Authority. Also, the third sentence incorrectly states that Routes C, 93 and 93A pass the property on Farrington Highway. These routes run on Interstate H-1 in the vicinity of the property. Routes 40 and 40A pass the property on Farrington Highway.

Should you have any questions regarding these comments, please contact Ms. Faith Miyamoto of the Transportation Planning Division at 768-8350.

Sincerely,

MELVIN N. KAKU

SUBJECT: HO'OPILI ENVIRONMENTAL IMPACT STATEMENT PREPARATION NOTICE (EISPN)

Dear Mr. Yoshioka:

Thank you for the letter dated April 18, 2007 (your reference number: TP3/07-198732R). We have reviewed your letter and offer the following responses to your comments.

1. It is anticipated that most of the roadways within the project area will be dedicated to the City and County of Honolulu; this will be noted in the Draft EIS.

2. Please be assured that we will continue to coordinate with the Department of Transportation Services (DTS) in regards to its Honolulu High-Capacity Transit Corridor Project; specifically the alignment of the transit corridor through and the location of a transit station within the project site.

3. We appreciate your suggested revisions to page 40 of the EISPN. These revisions will be made in the Draft EIS.

Thank you again for your participation in the Environmental Impact Statement process for this project. Your comments will be included in the Draft EIS.

If you have any questions regarding this project, please do not hesitate to contact me at 521 5631.

Sincerely,

Mr. Vincent Shigekuni
Vice President
PBR Hawaii & Associates, Inc.
Suite 650, American Savings Bank Tower
1001 Bishop Street
Honolulu, Hawaii 96813-3484

Dear Mr. Shigekuni:

Subject: Environmental Impact Statement Preparation Notice
Ho'opili
Ewa, Oahu
Tax Map Keys: 9-1-017: 004 (portion), 059, and 072; 9-1-018: 001 and 004;
9-1-010: 002, 014 (portion), and 015 (portion); 9-2-002: 002;
9-2-002: 001 (portion), 004, 005, 006, and 007

In response to your letter dated March 7, 2007, regarding the above-mentioned subject, the Honolulu Fire Department (HFD) reviewed the material provided and requires that the following be complied with:

1. Provide a fire apparatus access road for every facility, building, or portion of a building hereafter constructed or moved into or within the jurisdiction when any portion of the facility or any portion of an exterior wall of the first story of the building is located more than 150 feet (45 720 mm) from a fire apparatus access road as measured by an approved route around the exterior of the building or facility. (1997 Uniform Fire Code, Section 902.2.1.)

2. Provide a water supply, approved by the county, capable of supplying required fire flow for fire protection to all premises upon which facilities or buildings, or portions thereof, are hereafter constructed or moved into or within the county.

AR00027372

On-site fire hydrants and mains capable of supplying the required fire flow shall be provided when any portion of the facility or building is in excess of the 150 feet (45 720 mm) from a water supply on a fire apparatus access road, as measured by an approved route around the exterior of the facility or building. (1997 Uniform Fire Code, Section 903.2, as amended.)

3. Submit civil drawings to the HFD for review and approval.

Should you have any questions, please call Battalion Chief Lloyd Rogers of our Fire Prevention Bureau at 723-7151.

Sincerely,

KENNETH G. SILVA
Fire Chief

SUBJECT: HO'OPILI ENVIRONMENTAL IMPACT STATEMENT PREPARATION NOTICE (EISPN)

Dear Fire Chief Silva:

Thank you for your letter dated March 28, 2007 (your reference number: KGS/SK:jl). We offer the following responses to your comments:

1. Fire apparatus access roads shall be designed and constructed in accordance with the Uniform Fire Code, Section 902.2.1, as amended.

2. Water infrastructure shall be designed and installed in accordance with the Uniform Fire Code, Section 903.2, as amended.

3. Civil drawings will be submitted to your department for your review and approval.

Thank you again for your participation in the Environmental Impact Statement process for this project. Your comments will be included in the Draft EIS.

If you have any questions regarding this project, please do not hesitate to contact me at 521-5631.

Sincerely,

PBR HAWAII

Dear Mr. Shigekuni:

This is in response to your agency's letter of March 7, requesting comments on an Environmental Impact Statement Preparation Notice for the Ho`opili project in Ewa.

This project should have no unanticipated impact on the facilities or operations of the Honolulu Police Department.

If there are any questions, please call Major Michael Moses of District 8 at 692-4253 or Mr. Brandon Stone of the Executive Office at 529-3644.

Sincerely,

AR00027374

COMMENTS ON HO'OPILI ENVIRONMENTAL IMPACT STATEMENT PREPARATION NOTICE OF JANUARY 2007

NOTE: The following comments are based on an assumption that much of the text in the subject document will be included in the EIS.

Frank Genadio
Committee for Balanced Transportation

In two places concerning open space, on pages 7 and 8, reference is made to "As much as 210 acres of parks and open space could be provided" for the project. Suggest changing of the word "could" to "will" in the Draft EIS to ensure preservation of that open space. While the use of "could" in relation to schools is understood due to uncertainties on the potential number of students, the developer's firm commitment to open space will aid efforts for rezoning of the other acreage.

References to "rail," on pages 9, 10, and 20, are premature. Bill 79, passed by the City Council for transit, refers to a "fixed guideway." Suggest change to "mass transit"—unless a (pre-EIS publication) Council decision agrees with the city that some form of rail will be used on the fixed guideway.

Concerning electrical power development (page 10), no reference is made to solar power. Photovoltaic panels on any new construction—including affordable homes—will not only ease the burden on HECO's capacity but lead to lower prices for occupants' electricity. This form of energy will surely be even more efficient by the time the first homes and facilities in Ho'opili are under development.

Figure 6 shows DLNR land and business/commercial acreage (Parcel A) on both makai sides of the H-1 North-South Interchange. The interchange is shown in a "diamond" configuration, as currently planned by the State DOT. Suggest that both DLNR and Ho'opili developers agree to leave enough open space on the mauka side of those parcels to ensure room for a future full cloverleaf interchange, a much more efficient means of freeway access that will not require the (two) traffic signals needed for the diamond configuration. Text to that effect should be included in the Major Roads description on page 23.

The title for Section 2.2.3 states "...and Preliminary Costs." Suggest removal of this portion since no costs are given—unless they are added in the Draft EIS.

The last sentence of the first paragraph on page 52 should be changed to read something like "As the first phase of the project, the City Council selected a minimum operable segment (MOS) that will be from near the southwest corner of Ho'opili up the North-South Road to Farrington Highway, through Waipahu, Pearl City, and Aiea, and via Salt Lake Boulevard through downtown Honolulu to Ala Moana Center."

This study also should acknowledge the possibility of a rail maintenance and storage yard in the development area. Two sites are under consideration for the MOS, one near Leeward Community College and the other in Parcel B. Suggest adding a sentence to the (one sentence) second paragraph on page 52, to read "If required for the transit project, space will be allocated in Parcel B for a potential rail maintenance and storage facility." (NOTE: Personal testimony given to the City Council was for extension of the western end of the MOS by about 4,000 feet makai and placement of the facility in Kalaeloa or [possibly] as an expanded facility shared with the existing Hawaiian Railway yard.)

Editing Comments (provided in case this document is used for EIS preparation):

Page	Para	Line	Comment
12	1	6	Change "have been already been" to "have already been"
20	2	8	Change "compliment St. Francis" to "complement Hawai'i Medical Center West"
21	1	1	Change "connect" to "connects"
21	3	3	Change "is proposed" to "its proposed"
35	2	1	Change "no aircrafts" to "no aircraft"
43	6	1	Change "located the" to "located at the"
45	2	2	Change "of 6,600" to "6,600"
46	4	2	Change "Navy see" to "Navy to see"
47	4	3	The sentence starting with "However...five..." should be changed to read "The project will include as many as five..."
51	2	2	Change "23-mile" to "28-mile"
52	4	3	Change "Council has select" to "Council has selected"
52	5	5	Change "in residents" to "in which residents"
52	5	9	Change "Kapolei develops" to "Kapolei develop"

SUBJECT: HO'OPILI ENVIRONMENTAL IMPACT STATEMENT PREPARATION NOTICE (EISPN)

Dear Mr. Genadio:

Thank you for your letter received March 31, 2007. We offer the following responses to your comments:

1. We appreciate your suggested revisions to pages 7 and 8 of the EISPN, but planning for this project is in its infancy and between now and zoning there may be requests for more land set asides for the roadway improvements (such as the proposed East-West Connector) or additional school sites which were not originally envisioned. These public land set asides would have to come out of the land area currently set aside for parks and open space.

2. We appreciate your suggested revisions to pages 9, 10, and 20 of the EISPN. References to "rail" will be replaced with "mass transit" in the Draft EIS.

3. Current plans for the development of Ho'opili include both energy efficient design and the use of electricity to be developed and sold by Hawaiian Electric Company (which itself is exploring non-oil dependent sources of energy), and as such, the project will be suited for the use of renewable energy technologies including photovoltaics.

4. We acknowledge your concern regarding the configuration of the H-1 North-South Interchange, please be assured that the developer will continue to coordinate with the State Department of Transportation to ensure that the interchange will be properly planned. As we recently learned from a presentation by the State DOT Highways Division, a full, cloverleaf interchange was studied, and it was determined that there was not enough land area between H-1 and Farrington Highway.

5. As required by Chapter 343, *Hawaii Revised Statutes*, the Draft EIS is required to include a description of the "Phasing and timing of action." An expanded discussion regarding "Project Developed Timetable and Preliminary Costs" associated with the project will be included in the Draft EIS.

6. The Draft EIS will include the following:

   For the first phase of the transit project, the City Council selected a minimum operable segment (MOS) that will start near the southwest corner of the Ho'opili project and proceed up along the North-South Road to Farrington Highway, navigating toward the direction of Waipahu, Pearl City, and Aiea, and traversing to Salt Lake Boulevard en route for downtown Honolulu to Ala Moana Center. As of this writing, we understand that the portion of the alignment between the Kroc Center and Waipahu may be subject to change.

7. The Draft EIS will include the following:

   If required for the transit project, the developer will coordinate with DTS regarding the possibility of allocating a portion of the project lands for a potential mass transit maintenance and storage facility.

8. Thank you for pointing out the minor editing errors in the EISPN. These revisions will be made in the Draft EIS.

Thank you again for your participation in the Environmental Impact Statement process for this project. Your comments will be included in the Draft EIS.

If you have any questions regarding this project, please do not hesitate to contact me at 521-5631.

Sincerely,

PBR HAWAII

Vincent R. Shigekuni

HASEKO (Ewa), Inc.

April 9, 2007

Mr. Robert Bruhl
D.R. Horton – Schuler Division
828 Fort Street Mall, 4th floor
Honolulu, Hawaii 96813

Re: Ho'opili Environmental Impact Statement Preparation Notice ("EISPN")

Dear Mr. Bruhl:

Thank you for this opportunity to submit comments during the EIS scoping period for your exciting and vibrant Ho'opili project. According to the EISPN, approximately 100 acres of the Ho'opili project will be within the Kalo'i Gulch Watershed instead of the 300 acres that was originally anticipated. Because Ocean Pointe and Oneula Beach Park lies at the seaward terminus of the Kalo'i Gulch Watershed, we are particularly interested in the potential drainage impacts of this and other projects within the watershed.

We concur with the EISPN that, for project lands within the Kalo'i Gulch Drainage Basin, on-site detention basins will be constructed to collect stormwater runoff and discharge the flow at a rate that will not exceed pre-development conditions. We appreciate the EISPN's inclusion of the current discharge restrictions for landowners and developers in the Kalo'i Gulch Drainage Basin and the acknowledgment that these existing physical restrictions will remain in place until the flow capacity of the drainage channel is increased by construction of a permanent ocean outlet.

In order for the region's flood control plans to be effective, all developers in the watershed need to cooperate, participate and contribute to efforts to address issues such as on-site detention and retention of stormwater flows to control runoff volume.

We look forward to continuing participation by you and the other developers in the watershed as we collectively move forward on resolving this major regional issue.

Thank you for this opportunity to comment on your EISPN.

Very truly yours,

Nancy Maeda

SUBJECT: HO'OPILI ENVIRONMENTAL IMPACT STATEMENT PREPARATION NOTICE (EISPN)

Dear Ms. Maeda:

Thank you for your letter dated April 9, 2007. We acknowledge your interest in the potential drainage impact of the Ho'opili project and other projects within the Kalo'i Gulch Watershed. With respect to this portion of the project, on-site drainage basins will be constructed to collect all storm water runoff and discharge the flow at a rate that will not exceed pre-development conditions. Please note that we will continue to coordinate with the City and County of Honolulu and the State Department of Transportation to discuss issues within the Kalo'i Gulch Watershed. A Drainage Master Plan will be prepared and included in the Draft Environmental Impact Statement (EIS) for the project.

Thank you again for your participation in the Environmental Impact Statement process for this project. Your comments will be included in the Draft EIS.

If you have any questions regarding this project, please do not hesitate to contact me at 521-5631.

Sincerely,

PBR HAWAII

EIS

October 5, 2007

Mr. Vincent Shigekuni
PBR Hawaii & Associates, Inc.
ASB Tower - Suite 650
1001 Bishop Street
Honolulu, HI 96813-3484

Dear Mr. Shigekuni:

Re: Ho'opili
East Kapolei, Ewa, Oahu

Thank you for the opportunity to comment on the above-referenced project. We apologize for this late response.

HECO has no objections at this time. The following comments were received from various divisions of our Engineering Department:

(1) HECO has the following existing facilities within the project area that will require continued access for maintenance purposes:

(a) Transmission & Distribution - Overhead sub-transmission and distribution lines supplying Parcel F1; overhead transmission and distribution facilities within Parcel B; overhead facilities surrounding Parcels A, B, C and D; and

(b) Transmission Substation - Substation facilities, mainly within Parcel B;.

(c) Telecommunications - Overhead fiber optic cable facilities, mainly within Parcels B and C;

We appreciate your efforts to keep us apprised of the planning process and reserve the opportunity to further comment on the protection of existing power facilities and lines, as well as easements, that may be affected by the project. As the project progresses, please continue to keep us informed. We will be better able to evaluate any effects on our system facilities further along in the project's development. We request that development plans show all affected HECO facilities, and address any conflicts between the proposed plans and HECO's existing facilities. Please forward the pre-final development plans to HECO for review.

(2) Our Distribution Planning Division/Project Management has determined that to serve the ultimate load for the proposed development, three distribution substations, including power lines to and from them, will be needed. Installation of the substations and power lines will require Public Utilities Commission approval, as well other applicable state and city as approvals and permits. We request that these substations be included as part of the draft EIS.

(3) Should it become necessary to relocate HECO's facilities, please immediately submit a request in writing and we will work with you so that construction of the project may proceed as smoothly as possible. Please note that there may be costs associated with any relocation work, and that such costs may be borne by the requestor. Because any redesign or relocation of HECO's facilities may cause lengthy delays, upon determination that HECO facilities will need to be relocated, HECO should be notified immediately in order to minimize any delays in or impacts on the project schedule.

(4) Electrical Power Development, page 10. Please revise the available generation capacity (peak demand) from 1,669 MW to "1,687 megawatts (Gross MW)."

I suggest dealing directly with the following Engineering division contacts to coordinate HECO's continuing input in this project:

Transmission & Distribution - Michael Lum (543-7030)
Transmission Substation - Hope Hamada (543-7216)
Telecommunications - Terrine Uehira (543-7084)
Distribution Planning/Project Mgt - Kerstan Wong (543-7059)

Sincerely,

Kirk S. Tomita
Senior Environmental Scientist

SUBJECT: HO'OPILI ENVIRONMENTAL IMPACT STATEMENT PREPARATION NOTICE (EISPN)

Dear Mr. Tomita:

Thank you for your letter dated October 5, 2007. We acknowledge that the Hawaiian Electric Company, Inc (HECO) has no objections to the project at this time. We have reviewed your letter and offer the following responses to your comments.

1. The Draft EIS will note that existing HECO facilities are located within the project area. Should HECO have to tend to existing facilities within the project area, the Petitioner will allow continued access to HECO for maintenance purposes. Pre-final development plans will be forwarded to HECO for review.

2. We acknowledge your assessment that three distribution substations will be needed to serve the ultimate load for the project, including power lines extending out from the substations. In addition, the installation of power lines and substations will require approval by the State Public Utilities Commission, as well as other applicable State and City approvals and permits. The approximate location of these substations will be included in the Draft EIS.

3. Should the project's development require the relocation of HECO's facilities, the Petitioner will notify HECO immediately in order to minimize any delays in or impacts on the project schedule.

4. Please note that the available generation capacity (peak demand) of approximately "1,669 megawatts (MW)," will be revised to "1,687 megawatts (Gross MW)" in the Draft EIS.

We appreciate your suggestion to deal directly with HECO's engineering divisions to coordinate continuing input in the project. Thank you again for your participation in the Environmeutal Impact Statement process for this project.

If you have any questions regarding this project, please do not hesitate to contact me at 521-5631.

Sincerely,

PBR HAWAII

Hawaiian Telcom
April 2, 2007

PBR HAWAII
ASB Tower, Suite 650
1001 Bishop Street
Honolulu, Hawaii 96813

Attention: Mr. Vincent Shigekuni

Dear Mr. Shigekuni:

Subject: **Environmental Impact Statement Preparation Notice (EISPN) for Ho'opili, Ewa, Oahu, TMK: 9-1-17:04 (portion), 59, and 72; 9-1-18:01 and 04; 9-1-10: 02, 14 (portion), and 15 (portion) and 9-2-02:02, and 9-2-02:01 (portion), 04, 05, 06, and 07.**

Thank you for the opportunity to review and comment on the Environmental Impact Statement Preparation Notice (EISPN) in accordance to Hawaii Revised Statues, Chapter 343 and Administrative Rules, Title 11, Chapter 200 for Ho'opili with transmittal dated March 7, 2007.

We have the following comments to make:

- As far as Hawaiian Telcom is concerned, providing telephone service should not negatively impact the environment within the project area.
- Hawaiian Telcom has aerial and underground facilities along Farrington Hwy that will be affected by the road widening of Farrington Hwy. Further review is required by Hawaiian Telcom during the design stages of the project to determine the scope of work and the associated relocation costs.
- All electrical work shall conform to all electrical codes.
- Hawaiian Telcom requires electrical drawings of the project to be submitted for our review and approval before construction starts.

If you have any questions, please contact Cliff Anguay at 840-2989.

Sincerely,

Jill Z. Lee

SUBJECT: HO'OPILI ENVIRONMENTAL IMPACT STATEMENT PREPARATION NOTICE (EISPN)

Dear Ms. Lee:

Thank you for your letter received April 2, 2007. We offer the following responses to your comments:

1. We acknowledge your assessment that providing telephone service should not negatively impact the environment within the project area.

2. We acknowledge that the road widening of Farrington Highway will affect Hawaiian Telcom facilities along Farrington Highway, and therefore, will require further review during the design stages of the project to determine the scope of work and the associated relocation costs.

3. All electrical work shall conform to all electrical codes.

4. Electrical drawings of the project will be submitted to Hawaiian Telcom for review and approval before the start of construction.

Thank you again for your participation in the Environmental Impact Statement process for this project. Your comments will be included in the Draft EIS.

AR00027380

If you have any questions regarding this project, please do not hesitate to contact me at 521-5631.

Sincerely,

PBR HAWAII

Vincent R. Shigekuni
Vice President

13.0 COMMENTS ON THE DRAFT ENVIRONMENTAL IMPACT STATEMENT AND RESPONSES

The Ho'opili Draft Environmental Impact Statement was sent to the following agencies, organizations and individuals. The public comment period on the Draft EIS was from February 23, 2008 to April 8, 2008. Agencies, organizations, or individuals that submitted comments on the Draft EIS are listed in bold.

FACSIMILE TRANSMITTAL (3 pages) 523-1402

Mr. Vincent Shigekuni
Vice President
PBR Hawaii
ABS Tower, Suite 650
1001 Bishop Street
Honolulu, Hawaii 96813

Dear Mr. Shigekuni:

Subject: Draft Environmental Impact Statement (DEIS)
Hoopili (D.R. Horton – Schuler Homes)
TMK: 9-1-17: por. 4, 59, 72
9-1-18: 1, 4
Area: 1,553.884 acres

The Department of Agriculture has reviewed the subject document and offers the following comments and recommendations.

The proposed development will require the reclassification of the entire project area from the Agricultural to the Urban District. The City's Ewa Development Plan designates the area primarily for residential uses. Full development of the project will span from 2009 to 2030.

The project site has many of the attributes that would likely qualify it as candidate Important Agricultural Lands, pursuant to Chapter 205, Hawaii Revised Statutes. The Department of Agriculture acknowledges, however, that for many years the City has designated the project site and the balance of the Ewa plain for urban growth. Nevertheless, the loss of these highly productive agricultural lands and the relocation of the farming operations northward make it imperative that the agricultural lands, north of the H-1 Freeway and along Kunia Road, designated as "Agricultural Land Preservation"

Mr. Vincent Shigekuni
April 8, 2008
Page -2-

in the Ewa Development Plan and Central Oahu Sustainable Communities Plan remain in agriculture.

There are four farming operations that are leased or licensed to occupy nearly the entire project site – Aloun Farms (1,000 acres of which 301 are planted), Fat Law's Farm (100 acres of which 80 are planted), Sugarland Farms (197 acres of which 64 are planted), and Syngenta Seeds (200 acres of which 59 are planted).

We find the Agricultural Impact Analysis (AIA) to be very comprehensive and detailed in its description and analysis, but underplays the impact on agriculture by comparing to statewide rather than Oahu parameters. We recommend the full impact of the loss of productive agricultural use of the project site found throughout Volume I of the DEIS be discussed from an Oahu rather than statewide perspective as the primary market for most of the agricultural production is on Oahu. For instance, the 1,497 acres of leased agricultural land in the project site is 13.7% of the 10,900 acres of farm land said to be available on Oahu (3,150 acres in Kunia and 7,750 acres in the North Shore - Appendix A, page ES-5, section 9-b). The $6 million in farmgate revenues is about 4.4% of Oahu revenue from sales of all crops (2005 Statistics of Hawaii Agriculture, page 12), or 15.4% of the farmgate value of vegetables and melons produced on Oahu (ibid., page 11). The farm worker employment of 77 people represents about 3.7% of all the farm workers on Oahu (ibid., page 87).

Timely relocation of farms and related assets to new production areas is important to minimize the impact of the project on agriculture in general and maintain the availability of a significant supply of fresh food for Oahu. We note that the "...(p)etitioner continues to work on the eventual relocation of the largest tenant, Aloun Farm, Inc., to other farm areas in Central Oahu and the North Shore..." (DEIS Volume 1, page 30). We recommend that the EIS disclose and the Land Use Commission consider requiring meaningful relocation assistance be given to all affected farming operations. Furthermore, the importance of phased development and allowing cultivation of these lands up until the last possible moment is important and should be made a condition of approval by the Land Use Commission, given the 21-year build-out period and the importance of the production in the area to supplying Oahu's demand for fresh fruits and vegetables. Aloun Farms has vacuum cooling and packing facilities, these assets and those of the other farming operations should be described in the EIS and considered as part of the cost of relocation, particularly if they are fixed (immobile) assets. The lower-than-market land rents (ranging from $194 to $630 per acre/year) and irrigation water (pumped groundwater) will be difficult to match elsewhere, and as noted in the report, the primary source of irrigation water for the North Shore agricultural lands is contaminated with sub-standard treated effluent and until R-1 effluent standard can be achieved, cannot be used on directly edible crops (AIA, pages 29-30). In summary, farm relocation is likely to be expensive and time-consuming, even with the business-tested skills of the affected farmers.

AR00027387

Thank you for the opportunity to comment on this DEIS. Should you have any questions, please contact Earl Yamamoto at 973-9466 or email at earl.j.yamamoto@hawaii.gov.

Sincerely,

Sandra Lee Kunimoto

SUBJECT: HO'OPILI DRAFT ENVIRONMENTAL IMPACT STATEMENT

Dear Ms. Kunimoto:

Thank you for your letter dated April 8, 2008. We have reviewed your letter and offer the following responses:

Department of Agriculture Comment: "The project site has many of the attributes that would likely qualify it as candidate Important Agricultural Lands, pursuant to Chapter 205, Hawaii Revised Statutes. The Department of Agriculture acknowledges, however, that for many years the City has designated the project site and the balance of the Ewa plain for urban growth. Nevertheless, the loss of these highly productive agricultural lands and the relocation of the farming operations northward make it imperative that the agricultural lands, north of the H-1 Freeway and along Kunia Road, designated as "Agricultural Land Preservation" in the Ewa Development Plan and Central Oahu Sustainable Communities Plan remain in agriculture."

Response: We concur some that the property has some of the criteria that would qualify it as Important Agricultural Lands (IAL), the most important criteria being that it is currently in an economically viable agricultural production. It should be noted that the viability of existing agricultural operations is facilitated by extremely favorable land lease and water rates, which are kept at or below market rates). We also concur that since the City has designated the project site and the balance of the 'Ewa plain for urban growth, which the State has strongly supported. This is evidenced by the fact that the State played and continues to play a significant role in planning and funding for the growth of the Second City in Kapolei on formerly highly productive agricultural lands. Major investments in infrastructure (traffic) and other State-funded facilities and projects (the Villages of Kapolei, State office building, the planned new judiciary complex, various DHHL housing developments and the new UH West O'ahu Campus) have contributed and will contribute to the growth of the Second City.

AR00027388

Department of Agriculture Comment: "There are four farming operations that are leased or licensed to occupy nearly the entire project site — Aloun Farms (1,000 acres of which 301 are planted), Fat Law's Farm (100 acres of which 80 are planted), Sugarland Farms (197 acres of which 64 are planted), and Syngenta Seeds (200 acres of which 59 are planted)."

Response: We note the findings of the Agricultural Impact Analysis prepared for the DEIS differ slightly with the information provided above. Table 2 of the Agricultural Impact Analysis ("Hoopili Impact on Agriculture," Decision Analysts, Inc., February 2008) calculates the following: Aloun Farms (1,000 acres of which 301 are planted), Fat Law's Farm (100 acres of which 60 are planted), Sugarland Farms (197 acres of which 74 are planted), and Syngenta Seeds (200 acres of which 52 are planted).

Department of Agriculture Comment: "We find the Agricultural Impact Analysis (AIA) to be very comprehensive and detailed in its description and analysis, but underplays the impact on agrieulture by comparing to statewide rather than Oahu parameters. We recommend the full impact of the loss of productive agricultural use of the project site found throughout Volume I of the DEIS be discussed from an Oahu rather than statewide perspective as the primary market for most of the agricultural production is on Oahu. For instance, the 1,497 acres of leased agricultural land in the project site is 13.7% of the 10,900 acres of farm land said to be available on Oahu (3,150 acres in Kunia and 7,750 acres in the North Shore -Appendix A, page ES-5, section 9-b). The $6 million in farmgate revenues is about 4.4% of Oahu revenue from sales of all crops (2005 Statistics of Hawaii Agriculture, page 12), or 15.4% of the farmgate value of vegetables and melons produced on Oahu (ibid., page 11). The farm worker employment of 77 people represents about 3.7% of all the farm workers on Oahu (ibid, page 87)."

Response: Based on the information your Department provided, the third and twelfth paragraphs of Section 3.4 *Agricultural Impact, Anticipated Impacts and Mitigation Measures* of the Final EIS will be revised as follows:

> *The creation of the Ho'opili project will require that the approximately 1,553.844 acre Petition Area be withdrawn from agricultural use. The project will result in a direct loss of approximately 1,497 acres of agricultural land being leased for various agricultural operations. This amounts to less than one percent of the approximately 160,000 acres of agricultural land that remain available throughout the State of Hawai'i. On the island of O'ahu, approximately 10,900 acres of agricultural land would remain available in Kunia and the North Shore. <u>During the Draft EIS public review period, the State Department of Agriculture commented that the 1,497 acres of leased agricultural land in the project site is 13.7% of the 10,900 acres of farm land reported to be available on Oahu (3,150 acres in Kunia and 7,750 acres in the North Shore)...</u>*
>
> *Upon full build-out of the Ho'opili project, approximately $6 million per year in revenues, an average of about 80 jobs and $1.7 million per payroll will be displaced from the Petition Area. <u>According to comments received from the State Department of Agriculture during the Draft EIS public review period, "the $6 million in farmgate revenues is about 4.4% of Oahu revenue from sales of all crops (2005 Statistics of Hawaii Agriculture, page 12), or 15.4% of the farmgate value of vegetables and melons produced on Oahu (ibid., page 11). The farm worker employment of 77 people represents about 3.7% of all the farm workers on Oahu (ibid, page 87)."</u> Affected lessees are anticipated to be able to secure replacement lands, therefore, enabling them to maintain prior levels of production, sales revenues, employment and payroll. Should sufficient replacement land not be available on the island of O'ahu, then other options include the relocation of agricultural businesses to Neighbor Islands with available agricultural land.*

Department of Agriculture Comment: "Timely relocation of farms and related assets to new production areas is important to minimize the impact of the project on agriculture in general and maintain the availability of a significant supply of fresh food for Oahu. We note that the "...(p)etitioner continues to work on the eventual relocation of the largest tenant, Aloun Farm, Inc., to other farm areas in Central Oahu and the North Shore..." (DEIS Volume 1, page 30). We recommend that the EIS disclose and the Land Use Commission consider requiring meaningful relocation assistance be given to all affected farming operations. Furthermore, the importance of phased development and allowing cultivation of these lands up until the last possible moment is important and should be made a condition of approval by the Land Use Commission, given the 21-year build-out period and the importance of the production in the area to supplying Oahu's demand for fresh fruits and vegetables. Aloun Farms has vacuum cooling and packing facilities, these assets and those of the other farming operations should be described in the EIS and considered as part of the cost of relocation, particularly if they are fixed (immobile) assets. The lower- than-market land rents (ranging from $194 to $630 per acre/year) and irrigation water (pumped groundwater) will be difficult to match elsewhere, and as noted in the report, the primary source of irrigation water for the North Shore agricultural lands is contaminated with sub-standard treated effluent and until R-1 effluent standard can be achieved, cannot be used on directly edible crops (AIA, pages 29-30). In summary, farm relocation is likely to be expensive and time-consuming, even with the business-tested skills of the affected farmers."

Response: As indicated in the Draft EIS, the Petitioner has been working to assist the tenants in finding a suitable site or sites for relocation. However, to date, no site has been secured for that purpose. Given the planned growth in the region, the leases issued to the existing tenants reflected the fact that the area would be subject to urbanization in the future. The tenants all signed the leases with full knowledge of the circumstances. In the meantime and in light of the pending development of the region, land and water were kept at or below market rates.

We note your Department's comments that suggest that the Land Use Commission require meaningful relocation assistance be given to all affected farming operations. As indicated in the prior response, the Petitioner has been working to assist tenants to find sites for relocation and has been subsidizing their rents through below market rates for land and water. Indeed, provisions were also made for multi-year abatement of rent payments as a material enhancement to enter into a lease for an area that was openly acknowledged by all parties as slated for urban development.

With respect to your comment that Aloun Farms' assets such as their vacuum cooling and packing facilities and those of the other farming operations should be described in the EIS and considered as part of the cost of relocation, particularly if they are fixed (immobile) assets. We

AR00027389

have fully informed all tenants, including Aloun Farms, of the impending urbanization of the area and have cautioned against additional improvements being located in the Petition Area. In addition, the Petitioner's consideration of their tenants' future requests for improvements will take into consideration the impending development in the area.

It should also be noted that this area has been designated as an urban growth area and the State is also actively developing in the region on adjacent agricultural lands into the Villages of Kapolei, UH West O'ahu (UHWO) Campus, North-South Road and the Department of Hawaiian Home Lands East Kapolei development. As you are aware, Aloun Farms is also a tenant on State lands and will have to relocate from the UHWO and DHHL sites. The State played and continues to play a significant role in planning and funding for the growth of the Second City in Kapolei. Major investments in infrastructure and other publicly funded facilities have contributed to the growth of the Second City. In addition, the City and County of Honolulu is planning on embarking on what may be the largest Capital Improvement Project in the State's history in its Honolulu High Capacity Transit project, which is planned to start in East Kapolei and run through the Petition Area. Finally, during the public review period, the State Department of Land and Natural Resources (DLNR), Engineering Division wrote: "DLNR currently owns approximately 183 acres of land near and/or adjacent to the Ho'opili project...The DLNR parcels have excellent development potential based on the location of these lands adjacent to or near major arteries (H-1 Freeway, Farrington Highway, North-South Road) and the City's proposed transit line as well as the substantial increase development projects in the area." The DLNR parcels are being leased by some of the same tenants within the Petition Area.

In light of these impending State and County projects, the Petitioner has been working with its agricultural tenants to continue their operations on the Petitioner's land at Petitioner subsidized rates with the full understanding that the Petitioner will develop within the area in the next ten years. We have been and will continue to coordinate with our tenants on our development plans so that relocation will go as smoothly as possible; however, we respectfully disagree with the Department's suggestion that the Petitioner is singled out by being responsible for its tenants' relocation costs when it has attempted to accommodate displaced tenants from other urbanized areas, including State lands.

Thank you again for your Department's participation in the Environmental Impact Statement process for this project. Your Department's comment letter and this response will be included in the Final Environmental Impact Statement. If you have any questions regarding this project, please do not hesitate to contact me at 521-5631.

Sincerely,

PBR HAWAII

Honolulu, Hawaii 96813

Dear Mr. Shigekuni:

Subject: Hoopili, Oahu, Draft Environmental Impact Statement (DEIS) to Reclassify Approximately 1,553.844 Acres from Agriculture to Urban. Petition area: TMK 9-1-17:04 (portion), 59, and 72; 9-1-18:01 and 04; Remainder of the Project Area: 9-1-10:02, 14 (portion), and 15 (portion) and 9-1-17:04 (portion), and 9-2-01: 04, 05, 06 and 07; and 9-2-02:02

Thank you for your letter dated February 20, 2008. This project does not directly affect the Department of Accounting and General Services' projects or existing facilities, and we have no comments to offer at this time.

If you have any questions, please have your staff call Mr. Bruce Bennett of the Planning Branch at 586-0491.

Sincerely,

ERNEST Y. W. LAU
Public Works Administrator

SUBJECT: HO'OPILI DRAFT ENVIRONMENTAL IMPACT STATEMENT

Dear Mr. Lau:

Thank you for your letter dated March 6, 2008 (your reference number: (P)1070.8). We acknowledge your assessment that the proposed project does not directly affect the Department of Accounting and General Services' projects or existing facilities, and therefore, the department has no comments to offer at this time.

Thank you again for your participation in the Environmental Impact Statement process for this project. Your comment letter and this response will be included in the Final Environmental Impact Statement. If you have any questions regarding this project, please do not hesitate to contact me at 521-5631.

Sincerely,

PBR HAWAII

Mr. Vincent Shigekuni, Vice President
PBR Hawaii
ASB Tower, Suite 650
1001 Bishop Street
Honolulu, Hawaii 96813

Dear Mr. Shigekuni:

Subject: Docket No. A06-771
Draft Environmental Impact Statement (DEIS)
Ho`opili
Ewa, Oahu, Hawaii
Tax Map Keys: 9-1-17: por. 4, 59, and 72; and 9-1-18: 1 and 4

We have reviewed the subject DEIS for the proposed development and have the following comments:

1) In accordance with section 11-200-17(e)(5), HAR, the phasing and timing of the proposed action should be described. The DEIS points out that the project timeline extends from 2009 to 2030. Pursuant to the Land Use Commission's (LUC) rules (§15-15-50(c)(19), HAR), in the event full urban development cannot substantially be completed before ten years following LUC approval, a schedule for development of the total project together with a map identifying the location of each increment shall be provided. Accordingly, we request that the current development timetable in the DEIS be expanded to more specifically identify the phases of each component of the development and their respective timeline for completion and also be accompanied by a map illustrating their location.

2) In accordance with section 11-200-17(f), HAR, alternatives to the proposed action should be described in a separate and distinct section. We note that the alternatives that are presented are primarily discussed in a negative context relative to the proposed development. Please also include a discussion on the potential benefits of the alternatives, including the extent to which the alternatives could avoid some or all of the short and long-term adverse environmental effects.

235 SOUTH BERETANIA STREET ● SUITE 405 ● HONOLULU, HAWAI'I 96813 ● TEL (808) 587-3822 ● FAX (808) 587-3827 ● EMAIL: luc@dbedt.hawaii.gov
Mailing Address: P.O. Box 2359, Honolulu, Hawaii 96804

3) In accordance with section 11-200-17(h), HAR, the status of each identified approval should be described. Therefore, we request that to the extent possible the *projected* submittal dates (i.e., by month/year) of the applications and plans for approval to the various agencies be provided.

4) In accordance with section 11-200-17(i), HAR, the probable impact of the proposed action on the environment shall be included. Review of the DEIS indicates that no inventory and assessment of arthropods on the subject property was conducted. In the interest of full environmental disclosure, we request that such a study be conducted.

In addition, we request that the discussion on solid waste disposal (section 4.8.6) reference the LUC's recent action that extended the deadline to close the Waimanalo Gulch Sanitary Landfill to November 1, 2008, and the current plans of the City and County of Honolulu Department of Environmental Services to expand the landfill by another approximately 92.5 acres.

A discussion on the existing civil defense conditions and potential impacts and proposed mitigation measures should also be included.

Section 11-200-17(i), HAR, also requires that the interrelationships and cumulative impacts of related projects be discussed, including the potential secondary effects. We note that section 7.2, *Cumulative and Secondary Impacts*, confines the discussion to proposed developments in the East Kapolei region to include the University of Hawaii at West Oahu campus, the Department of Hawaiian Home Lands East Kapolei Development Parcels 1 and 2, and the Kroc Center. We note that there is no mention of *existing* developments in the Ewa District in which the project is situated. Accordingly, we request that existing developments, including, but not limited to, the communities of Waipahu, West Loch, and Ewa Villages also be considered in the assessment of cumulative and secondary effects.

5) We note that the subject property was cultivated in sugarcane or pineapple and is currently used for, among other things, diversified agriculture. As such, there may be chemicals associated with these activities that are present in the soils. To the extent that such chemicals could be a threat to public health and the environment, we request that this matter be assessed to determine the potential risks and any remedial action that needs to be taken.

6) We request that information on the cost of the project be expanded to include a breakdown of costs by component (onsite and offsite) and by development phase.

7) For your information, Schuler Homes, Inc., a Delaware corporation, filed a Petition for Land Use District Boundary Amendment (Petition) on May 16, 1996, to reclassify a portion of the Petition Area, consisting of approximately 753.573 acres of land, from the Agricultural District to the Urban District for single and multi-family residential, commercial, school, and park uses. The Petition was voluntarily withdrawn pursuant to

AR00027393

the Commission's Order Granting Motion to Withdraw Petition for Land Use District Boundary Amendment dated September 18, 1996. We request that the DEIS be revised to include this previous filing in the background description of the Petition Area.

We have no further comments to offer at this time. Thank you for the opportunity to comment on the subject DEIS.

Should you have any questions, please feel free to call me or Bert Saruwatari of our office at 587-3822.

Sincerely,

RODNEY A. MAILE
Interim Executive Officer

SUBJECT: HO'OPILI DRAFT ENVIRONMENTAL IMPACT STATEMENT

Dear Mr. Davidson:

Thank you for the letter dated March 27, 2008. We have reviewed the LUC's letter and offer the following response to your comments.

1. As requested the preliminary phasing and timing of the proposed project will be provided in the Final EIS. Section 2.7 *Development Timetable and Preliminary Costs* of the Final EIS will be revised as follows:

Tel: (808) 242-2878

AR00027394

The Petitioner estimates that the development of the Ho'opili project (major off-site and on-site infrastructure improvements including grading, drainage, sewer, safe-drinking water, non-potable water, roadways, landscaping and improvements to Farrington Highway and North-South Road for access) will cost approximately $4.6 billion (in Year 2007 dollars), spent over the project timeline of 2009 – 2030. During the public review period, both the Land Use Commission and the State Office of Planning made reference to subsection 15-15-50, Hawaii Administrative Rules (HAR). Subsection 15-15-50, HAR identifies the form and contents of a petition to the State Land Use Commission to amend the State Land Use District Boundaries, including representing "...that development of the subject property in accordance with the demonstrated need therefore will be accomplished before ten years after the date of commission approval. In the event full urban development cannot substantially be completed within such period, the petitioner shall also submit a schedule for development of the total of such project in increments together with a map identifying the location of each increment, each such increment to be completed within no more than a ten-year period." The construction of Ho'opili's development will be a challenging process that will require ongoing coordination between many fundamental parts. Infrastructure and road access, neighboring property development, demands of the commercial and housing markets, careful continued agriculture and general property management, and economic viability will all be considered throughout the construction planning process. Furthermore, the City & County of Honolulu's (City) transit project, the largest public works endeavor in Hawai'i's history, will within Ho'opili have its longest traverse through privately owned property and further expand development challenges undoubtedly in unprecedented ways. Many of these parts may involve developing different areas of the project site within the same construction timetable as discussed further below:

Several major development priorities include in no particular order:

- *Water Service from the North. Both of Ho'opili's main potable water storage and transmission systems will reside mauka of H-1. Considerable investment will be required in the construction of tanks and transmission lines that will ultimately service two water zones within Ho'opili that roughly divide the site between northern and southern halves. (Necessary offsite utility easements have already been secured at a price.) Nonpotable water will be sourced from the reclamation operations at the Honouliuli Wastewater Treatment Plant (WWTP), meaning it will be delivered to Ho'opili from the opposite end from where its potable source will come. Preliminary budgetary construction cost estimates range from between $35 million to $40 million with another $20 million possible from BWS for service connections.*

- *Sewer Service from the South. Unlike Ho'opili's main water system, sewer service will come from the southern end of the property. The first of what is expected to be several Joint Development Agreements (JDA) to secure and construct wastewater transmission is in place with DHHL, UHWO, DLNR and the City and funded. Indeed, the DOT has already constructed this line as part of the North-South Road Phase 1A contract. Discussions are expected to commence later this year in earnest on separate JDAs for two additional segments. Nearly $2 million has already been invested to date, preliminary budgetary costs estimates for these two JDAs range from $10 million to $15 million to stub service at the property's southwestern border, $5 million to $10 million to route through to the mauka area and as much as another $60 million for the City's Department of Environmental Services uses connection charges.*

- *Balancing Spread out Access, Initial Infrastructure Needs and Cash Flows. Today, Ho'opili's lands along the Farrington Highway corridor, its northernmost boundary, present Ho'opili's easiest access for construction purposes and future occupants. Once DHHL completes its section of the East-West Connector Road and the State DOT completes the North-South Road (both now under construction), Ho'opili will have construction and occupant access open at its southern and westernmost locations. This is significant because while available for development today, the Farrington Highway corridor is expected to present some of Ho'opili's greatest development challenges, predominantly the distance sewer lines will have to run through undeveloped land for service, as well as timing development to the City's planned improvements to Farrington Highway itself. Thus, the Petitioner will look to mobilize on these other areas as early as practicable. Nonetheless, there are several key commercial parcels in this Farrington Highway corridor that will need to be among the earliest to be marketed in order to generate cash flow to support needed upfront utility (such as water and sewer as detailed above) and road infrastructure throughout Ho'opili. As a result, development should be started in more than one area from the onset. Over the build-out of the project, it is expected that as much as $50 million to $60 million could be spent on drainage systems and hundreds of millions will be invested in roadway systems servicing the project.*

- *Balancing Job Generation, Appropriate Initial Housing Deliveries and Transit. The majority of the employment areas within Ho'opili are within the Farrington Highway corridor to the north of the property, while the residential development areas that could be most sensible to develop first – the single-family areas – are to the south. Starting housing construction there could generally preserve higher density development in the areas in and around the transit corridor to the north to be better staged with transit's completion and more appropriately address the various demands it will create.*

- *Managing Agricultural Operations. As lands are moved into development over time, consideration will have to be given to the significant challenges of maintaining a working agricultural water system and providing ongoing and unencumbered vehicular access to crop areas. This will be no small task, as it will be the objective of the Petitioner to keep active farms onsite as long as practicable.*

AR00027395

As previously stated the development is expected to occur over approximately 20 years. This area of 'Ewa has long been planned for development (Kapolei Area Long Range Master Plan and Ewa Development Plan).

There are several major transportation projects that have been planned for 'Ewa. The Ho'opili project has been planned assuming that certain planned transportation projects will be constructed including a portion of North-South Road between Farrington Highway and Kapolei Parkway; a portion of the North-South Road and a new H-1 Freeway interchange; a portion of the intersection of North-South Road and Farrington Highway; the long-planned widening of Farrington Highway fronting Ho'opili; the proposed East-West Connector Road through the Petition Area; and the first segment of the proposed Honolulu High-Capacity Transit Corridor project through the Petition Area. As major off-site infrastructure (water, sewer, drainage, electrical and communications) would likely occur in most of the above major road right-of-ways, and the exact timing of the completion of these transportation improvements undetermined, it is difficult for the Petitioner to provide a map identifying the phasing of the proposed action in 10 year increments with any degree of certainty. While the phasing of development may be more relevant where there is little or no development, 'Ewa has rapidly developed in recent years and proposed transportation improvements are indicative of State and County assumptions that this portion of 'Ewa would be eventually developed.

2. Alternatives to the proposed action were already described in separate and distinct sections of the Draft EIS (Section 6.0). Section 6.0 *Alternatives to the Proposed Action* of the Final EIS will be revised as follows:

In compliance with the provisions of Title 11, Department of Health (DOH), Chapter 200, Environmental Impact Statement Rules, Section 11-200-10(6), the alternatives considered are limited to those that would satisfy the objectives of the proposed mixed-use development, while minimizing the potential for adverse environmental impacts. The feasible alternatives must realistically address the project's economic characteristics while also responding to the surrounding land uses that will be impacted by the project. In conformance with applicable regulations, other possible alternatives have been investigated to identify alternative sites, the appropriate uses for the property, and how they would best be accomplished.

6.1 "No-Action" Alternative

The "no-action" alternative would not be consistent with stated governmental policies, which direct future growth to the 'Ewa region. The City and County of Honolulu General Plan states:

> *Encourage development within the secondary urban center at Kapolei and the Ewa and Central Oahu urban-fringe areas to relieve developmental pressures in the remaining urban-fringe and rural areas and to meet housing needs not readily provided in the primary urban center.*

Under this alternative, the site would remain as agricultural land, underutilized in terms of meeting the demand for residential homes (including affordable homes) and accompanying land uses. The potential benefit of this alternative is that while remaining under cultivation, the site would provide open space. Implementation of this alternative will avoid: infrastructure impacts (solid waste, wastewater and additional stormwater runoff generated on site); visual impacts (appearance of the site changing from agricultural fields to a master-planned urban development); the loss of agricultural employment; traffic impacts; and construction-related impacts (such as construction noise, construction equipment exhaust emissions, temporary traffic disruption, fugitive dust and soil erosion). Occasionally, however, continued cultivation, harvesting and plowing of the site will expose soils to the erosional forces of wind and rainfall. The demand for housing could result in the following scenarios or combinations thereof: there would be more pressure to develop in the other districts, including the rural areas and other areas currently used for cultivation; there could be a demand for higher density housing in undeveloped areas of 'Ewa at a density not experienced to date; there would be more "doubling up" (larger number of persons per household, with more than one family under roof); those that are not willing to put up with the previously described scenarios may decide to relocate to the U.S. mainland where housing prices have dropped.

The "no-action" alternative was rejected because it is not consistent with government plans to develop Kapolei as the Second City.

6.2 Alternative Sites

There are very few large parcels left on O'ahu that are designated for residential development. The largest amount of developable land that is undeveloped lies in Central O'ahu and on the North Shore. As shown on the Ewa Development Plan, the Petition Area is designated mostly Low and Medium Density Residential. As such, the City and County of Honolulu has long recognized that the Petition Area is best used for residential and other development. Directing growth to 'Ewa and in the "urban-fringe" portions of Central O'ahu reduces the pressure to develop outside of the Urban Growth Boundary of Central O'ahu, and the North Shore, Ko'olau Loa, Ko'olau Poko and Wai'anae districts. This alternative has been rejected because it would be clearly contrary to General Plan policy. The potential benefit of this alternative is that for those that object to further development on the 'Ewa Plain, it might be preferable for development to occur elsewhere on O'ahu, such as in the Primary Urban Center, East Honolulu, Central O'ahu, North Shore, Ko'olau Loa, Ko'olau Poko and Wai'anae districts.

The potential benefit of this alternative is that while remaining under cultivation, the site would provide open space. Implementation of this alternative will avoid: infrastructure impacts (solid waste, wastewater and additional stormwater runoff

AR00027396

generated on site); visual impacts (appearance of the site changing from agricultural fields to a master-planned urban development); the loss of agricultural employment; traffic impacts; and construction-related impacts (such as construction noise, construction equipment exhaust emissions, temporary traffic disruption, fugitive dust and soil erosion). Occasionally, however, continued cultivation, harvesting and plowing of the site will expose soils to the erosional forces of wind and rainfall.

6.3 Alternatives Related to Different Designs or Details of the Proposed Actions Which Would Present Different Environmental Impacts

Different designs could be applied to the project, and depending on the density and design capacity, would result in different environmental impacts. For example, a higher density project that kept the same residential unit count as proposed (11,750) would reduce the buildable area (a positive benefit) and possibly reduce the quantity of surface runoff (a positive benefit). ~~This~~ Another potential benefit of this alternative is that it would likely be easier to serve by bus and correspondingly increase ridership. However, the residential buildings would be larger and taller. This alternative would not allow as wide a range of residential products to market and was thus rejected. Implementation of this alternative will not avoid: infrastructure impacts (solid waste, wastewater and additional stormwater runoff generated on site); visual impacts (appearance of the site changing from agricultural fields to a master-planned urban development); the loss of agricultural employment; traffic impacts; and construction-related impacts (such as construction noise, construction equipment exhaust emissions, temporary traffic disruption, fugitive dust and soil erosion).

Another alternative would be to set aside less open space and to spread out the community over a larger land area. Such an alternative is best portrayed by the current Kapolei Long Range Master Plan and Ewa Development Plan Land Use Map designations for the Petition Area. This alternative would reduce the density (to some, a positive benefit) but consume more land, increasing the quantity of surface runoff, and requiring a much larger investment in grading and infrastructure. This alternative would make it difficult for residents to be served by bus, and even more difficult by high-capacity transit. Implementation of this alternative will not avoid: infrastructure impacts (solid waste, wastewater and additional stormwater runoff generated on site); visual impacts (appearance of the site changing from agricultural fields to a master-planned urban development); the loss of agricultural employment; traffic impacts; and construction-related impacts (such as construction noise, construction equipment exhaust emissions, temporary traffic disruption, fugitive dust and soil erosion). This alternative was also rejected.

The demand for safe drinking water and the quantities of wastewater, solid waste, and traffic generated would vary with different designs, depending on the number/quantity of residential units, schools, commercial square footage, and roads.

6.4 Actions of a Significantly Different Nature Which Would Provide Similar Benefits With Different Environmental Impacts

One scenario that would be significantly different from the proposed action is that an elevated rail line and accompanying transit stops would not be built through Ho'opili. Implementation of this alternative will not avoid: infrastructure impacts (solid waste, wastewater and additional stormwater runoff generated on site); visual impacts (appearance of the site changing from agricultural fields to a master-planned urban development); the loss of agricultural employment; traffic impacts (assume greater traffic impacts than without the HHCTC project); and construction-related impacts (such as construction noise, construction equipment exhaust emissions, temporary traffic disruption, fugitive dust and soil erosion). The impacts of this scenario will be more fully described in the upcoming HHCTC DEIS.

For the 'Ewa district drivers enduring the longest morning commutes to the Central Business District or UH Mānoa, the modes of transportation will continue to be limited to: private motorized vehicle (including zipper lane), TheBus, TheBoat, Vanpool, et cetera. While this is a scenario that could inevitably result in lengthening commute times, individual commuters will either: bear with the commute in return for the comfortable lifestyles offered by their homes in 'Ewa; move from their homes in 'Ewa and move closer to their workplaces or schools; or find schools and/or employment in the 'Ewa region. The opening of UHWO will reduce traffic from those undergraduate students in Leeward and Central O'ahu who commute to UH Mānoa, and indirectly reduce the demand for student housing on the UH Mānoa campus (reducing the demand for off-street parking demand on campus, reducing the demand for on-street parking in the surrounding neighborhoods, increasing the supply of student housing on campus, and reducing the demand for student housing off-campus). If the Petitioner is allowed to develop a mixed-use (residential/commercial/office/light industrial) project as proposed, then, more employment opportunities will be provided to existing residents of the region, reducing the need for some 'Ewa residents to commute outside of the District to work. To offset the non-implementation of the HHCTC project, the City and County of Honolulu may decide to increase The Bus and The Boat services. The positive benefits of this alternative is that the visual impact impacts of an elevated rail system would be avoided as well as long-term commitment of State and Federal funds for the HHCTC project. This alternative is not desirable, but feasible.

6.5 The Alternative of Postponing Action Pending Further Study

Development of the 'Ewa region as O'ahu's Second City has been studied and planned for many years. Further study of any proposed development on the property would only be delaying what has long been proposed in the Ewa Development Plan. Therefore, this alternative was rejected, as it would not achieve the overall objectives for the project, which would create a mixed-use community that more employment opportunities will be provided to existing residents of the region, reducing the need for some 'Ewa residents to commute outside of the District to work. The potential

AR00027397

benefit of this alternative is that while remaining under cultivation, the site would provide open space. Occasionally, however, continued cultivation of the site would generate dust when portions of the site are harvested and plowed. Implementation of this alternative will temporarily avoid: infrastructure impacts (solid waste, wastewater and additional stormwater runoff generated on site); visual impacts (appearance of the site changing from agricultural fields to a master-planned urban development); the loss of agricultural employment; traffic impacts; and construction-related impacts (such as construction noise, construction equipment exhaust emissions, temporary traffic disruption, fugitive dust and soil erosion). Occasionally, however, continued cultivation, harvesting and plowing of the site will expose soils to the erosional forces of wind and rainfall.

3. As requested, Table 2.3 *Required Permits/Approvals* of the EIS will be revised to include the projected submittal dates (as follows).

Table 2.3. Required Permits/Approvals

PERMIT/APPROVAL	APPROVING AUTHORITY	STATUS	PROJECTED SUBMITTAL DATE
State Land Use District Boundary Amendment (with EIS)	State of Hawai'i Land Use Commission	Petition has been filed; processing on hold until EIS process has been completed.	First Quarter 2007
Zone Change	City and County of Honolulu Department of Planning and Permitting/City Council	Application to be filed assuming successful processing of SLUDBA.	Third Quarter 2009
Large Lot Subdivision ~~Approval~~ Action	City and County of Honolulu Department of Planning and Permitting	Application to be submitted after change the Zone Change application is approved.	Third Quarter 2010
National Pollutant Discharge Elimination System (NPDES) Permit	State of Hawai'i Department of Health	Application to be submitted prior to Building/Grading Permits.	2011
Building/Grading Permits	City and County of Honolulu Department of Planning and Permitting	Application to be filed after the Zone Change application is approved.	2011
Water Use Permit	State of Hawai'i Department of Land and Natural Resources, Commission on Water Resource Management	Application to be submitted prior to Building/Grading Permits	2011

AR00027398

4. As requested, an assessment of arthropods on the subject property was conducted and is enclosed to this letter. A new paragraph will be added before the last paragraph of Section, 3.8 Fauna, Existing Conditions of the Draft EIS:

> *During the public review period, the Land Use Commission requested an assessment of arthropods on the Petition Area. A survey of arthropods on the Petition Area was conducted on May 9, 2008 by Dr. Gregory Brenner of Pacific Analytics, L.L.C. The primary objectives of the survey were to: provide a general description of the arthropod fauna of the Petition Area; evaluate the habitats (if any); and search and assess the potential for threatened or endangered arthropod species as well as species of concern. According to Dr. Brenner, the arthropod species that were collected during the study would be considered typical of what would be found in lowland sites with little or no native vegetation and disturbed by agricultural operations. No species were found that are locally unique to the site. A copy of the assessment is attached to this EIS as Appendix R.*

In addition a new paragraph will be added after the last paragraph of Section 3.8 *Fauna, Anticipated Impacts and Mitigation Measures:*

> *The results of the arthropod survey at the Petition Area (See Appendix R) indicate that there are no special concerns or legal constraints related to invertebrate resources in the Petition Area. No invertebrate species listed as endangered, threatened or that are currently proposed for listing under either federal or State of Hawai'i endangered species statutes are known to exist on the project site.*

As requested, the second paragraph of Section 4.8.5 *Solid Waste Disposal Facilities* of the EIS will be revised as follows:

> *Waimānalo Gulch Landfill, which opened in 1989, is located northwest of the proposed Ho'opili project. While the land is owned by the City and County of Honolulu, the landfill is operated by Waste Management, Inc. The site accepts ash and residue from the H-POWER facility, industrial wastes, and non-combustible construction and demolition debris. Commercial haulers pay $72.75 per ton to dispose solid waste at the facility. During the public review period, the State Land Use Commission reported that it took action to extend the deadline to close the Waimanalo Gulch Sanitary Landfill to November 1, 2008, and the City and County of Honolulu Department of Environmental Services has plans to expand the landfill by another approximately 92.5 acres.*

As requested, a discussion on the existing civil defense conditions and potential impacts and proposed mitigation measures will also be included. During the public review period, the State Civil Defense's (SCD) requested that the developer install at least three outdoor warning sirens. A new paragraph will be added at the end of Section 3.6 *Natural Hazards, Anticipated Impacts and Mitigation Measures* of the EIS to read as follows.

> *During the public review period of the Draft EIS, the State Civil Defense (SCD) commented that "the developer install at least three outdoor warning sirens... At the present time SCD personnel recommends that the minimum-size siren have a sound rating of 121-decibels @ 100 feet, omni-directional and solar powered." SCD also noted that "As the development plans are finalized, State Civil Defense (SCD) will be better able to define the placement and size of the sirens." The Petitioner will continue to coordinate with the SCD as development plans are finalized to be better able to define the placement and size of the sirens.*

As requested, Section 7.2 *Cumulative and Secondary Impacts* of the EIS will be revised to include a discussion of existing developments.

> *This chapter identifies cumulative and secondary impacts that may result from the development of Ho'opili and the East Kapolei region. During the public review period, the State Department of Land and Natural Resources (DLNR), Engineering Division wrote: "DLNR currently owns approximately 183 acres of land near and/or adjacent to the Ho'opili project...The DLNR parcels have excellent development potential based on the location of these lands adjacent to or near major arteries (H-1 Freeway, Farrington Highway, North-South Road) and the City's proposed transit line as well as the substantial increase development projects in the area. Consequently, regional infrastructure should take into consideration the potential development of the DLNR parcels, and DLNR requests that it be included in the planning and design of any regional infrastructure in the area that would serve the DLNR parcels."*
>
> ***7.2.1 Impacts on the Physical Environment***
>
> *Climate, Topography, and Soils. Planned developments in the East Kapolei region (the proposed Ho'opili project, University of Hawai'i at West O'ahu (UHWO), Department of Hawaiian Home Lands (DHHL) East Kapolei Development Parcels 1 and 2, Kroc Center, and the "DLNR parcels") are not expected to adversely impact regional climate, topography, and soils of existing developments, including, but not limited to, the communities of Waipahu, West Loch, Honouliuli, 'Ewa Villages, 'Ewa Villages of Kapolei and Makakilo. However, within their respective project sites, construction of the East Kapolei developments will impact mostly minor topographic features and soils, and new buildings may affect the respective micro-climate of each building site (by retaining and/or reflecting solar energy and heat, creating shade where none presently exists, or creating "wind tunnels"). Grading operations will comply with DOH regulations and are not expected to adversely impact air and water quality.*
>
> *Drainage and Groundwater. Regional infrastructure will be developed to control drainage in the East Kapolei area, for those areas draining into Kalo'i Gulch. The planned developments will introduce impervious surfaces through the construction of buildings, roadways, parking areas, and walkways. Increased impervious surfaces*

AR00027399

(i.e., roofs, roadway surfaces, and sidewalks) will increase the potential for runoff, although existing and proposed detention basins throughout East Kapolei will effectively manage drainage towards Kalo'i Gulch or other drainage basins. Through implementation of the proposed drainage improvements, the planned developments in East Kapolei are not expected to adversely impact existing developments, including, but not limited to, the communities of Waipahu, West Loch, Honouliuli, 'Ewa Villages, 'Ewa, Ocean Pointe, Villages of Kapolei and Makakilo. Additionally, landscaping introduced by the East Kapolei developments will reduce the potential for soil erosion, compared to current conditions on vacant and actively cultivated lands. All drainage facilities will comply with the City and County of Honolulu's Storm Drainage Standards. A non-potable water system will be developed for 'Ewa to reduce the demand for safe drinking water from the BWS system.

Natural Hazards. *It is unlikely that any of the proposed structures and uses associated with the planned developments in 'Ewa will affect the potential occurrence of earthquakes, hurricanes, or tsunami or adversely impact existing developments, including, but not limited to, the communities of Waipahu, West Loch, Honouliuli, 'Ewa Villages, 'Ewa, Villages of Kapolei and Makakilo. By designing future structures to the then-approved building code, future buildings will likely be designed to mitigate the potential damage from natural hazards.*

Flora and Fauna. *The cumulative impact of the planned developments in East Kapolei is the reduction of habitat. However, past and present agricultural activities in the Petition Area have altered natural habitats; as such, existing flora and fauna are primarily introduced species. During construction, faunal species are likely to vacate the site for suitable habitats nearby. After construction, these species may return, depending on their preference of habitat and the landscaping provided. The planned developments in East Kapolei are not expected to adversely impact the flora and fauna of existing developments, including, but not limited to, the communities of Waipahu, West Loch, Honouliuli, 'Ewa Villages, 'Ewa, Villages of Kapolei and Makakilo.*

7.2.2 Impacts on the Human Environment

Archaeological/Historic and Cultural Resources. *An archaeological inventory survey was conducted of the Petition Area. Five historic properties were documented on the Petition Area. All five historic properties have been assessed as eligible for the State Register of Historic Places under Criteria C and D, except for Site 4344, which is only eligible under criterion D. The State Historic Preservation Division (SHPD) concurs with these significance assessments. According to SHPD, the archaeological inventory survey report is now accepted. In addition, a preservation plan and archaeological monitoring plan will be prepared and submitted to SHPD for its review and approval. Recently completed archaeological inventory survey reports for both the proposed project and the neighboring 500-acre UHWO site provide more information about the 'Ewa area and consistently show that due to prior sugar cane cultivation, pre-historic features are nearly non-existent. A cultural*

impact assessment was also prepared for the Petition Area and it found that there are no contemporary or continuing cultural or traditional practices currently occurring within the proposed Project Area. Therefore, no impacts are expected and no mitigation measures are planned. The regional cumulative impacts on archaeological and cultural resources within 'Ewa appear to be minimal. The planned developments in East Kapolei are not expected to adversely impact the archaeological and historical resources of the existing surrounding communities, including, but not limited to, the communities of Waipahu, West Loch, Honouliuli, 'Ewa Villages, 'Ewa, Villages of Kapolei and Makakilo.

Agriculture. *Lands in the Petition Area and the remainder of 'Ewa were historically used for sugarcane cultivation and most recently for diversified agriculture. Much of East Kapolei (including the Petition Area) is actively cultivated through short-term agreements. With the proposed developments in East Kapolei (UHWO, DHHL East Kapolei Development Parcel 1, DHHL East Kapolei Development Parcel 2 and Ho'opili, land will be withdrawn from production, resulting in some loss in revenues, jobs, and payroll, unless replacement agricultural leases are established elsewhere. While ~~A~~ample agricultural land is available to accommodate the projected growth of diversified agriculture on O'ahu (such as Central O'ahu and the North Shore) and elsewhere in the State of Hawai'i, some reviewers of the Draft EIS have expressed concern about the potential loss of agricultural land. The planned developments in East Kapolei are not expected to adversely impact the agricultural resources of the existing surrounding communities, including, but not limited to, the communities of Waipahu, West Loch, Honouliuli, 'Ewa Villages, 'Ewa, Villages of Kapolei and Makakilo. However, ultimate development of the Petition Area and the remainder of East Kapolei will reduce the exposure of soils to the erosional forces of wind and rainfall.*

Noise. *Over the long term, as 'Ewa develops and the 'Ewa population grows, noise levels will increase above current conditions. Residential, business/commercial, light industrial/business, parks, schools and other public facilities will generate noise. New roadways and improvements to existing roadways are proposed, and vehicles traveling to, from, through, and within the 'Ewa area will be a significant contributar of noise. The planned HHCTC will also generate noise. East Kapolei is generally not surrounded by noise sensitive uses (residential, educational and medical structures and facilities). Mauka of East Kapolei is H-1 and vacant land. To the west is the Kapolei Golf Course. To the south are Kapolei Parkway and the 'Ewa Villages Golf Course and to the east and grade-separated is Old Fort Weaver Road and Honouliuli Village. ~~However~~Moreover, noise-sensitive uses (residential, educational and medical) occurring in buildings are likely to be insulated and equipped with air conditioners, mitigating noise from traffic, wind, and aircraft.*

Air Quality. *Emissions from cars and equipment used to generate electricity can affect air quality. The planned developments in East Kapolei will attract traffic and use electricity, but are not expected to significantly affect regional air quality, as new technologies, increasingly stringent air pollution control regulations and improving*

AR00027400

automobile technology, and alternative forms of transportation (i.e., Honolulu High-Capacity Transit Corridor (HHCTC), buses and other public transportation, bicycling, walking) may offset potential increases in air pollution. Predominant tradewinds during the afternoon provide dispersal of emissions. The planned developments in East Kapolei are not expected to adversely impact the long-term air quality of the existing surrounding communities, including, but not limited to, the communities of Waipahu, West Loch, Honouliuli, 'Ewa Villages, 'Ewa, Villages of Kapolei and Makakilo. Depending on the phase of construction, there will be occasions when dust may be generated despite mitigative measures (such as during gusts of particularly strong wind) and depending on the location of construction may affect Honouliuli (which is mostly upwind of the project site), 'Ewa Villages (separated by the 'Ewa Villages Golf Course) and the DHHL East Kapolei Development Parcel 2 project (abutting). The Petitioner and DHHL is coordinating on mitigating this potential impact.

Man-Made Hazards. No industrial facilities handling explosive or fire-prone materials (i.e., liquid propane, gasoline, or other storage tanks) exist in the Petition Area. However, there are two hazardous sites in and near the East Kapolei area – the former 'Ewa Sugar Mill, which is surrounded by the 'Ewa Villages residential and golf project and has a current status of No Further Remedial Action Planned, and the 'Ewa Sugar/O'ahu Sugar Company Pesticide Mixing and Loading Site, which is located to the east of North-South Road on Department of Hawaiian Home Lands (DHHL) property. The land uses proposed by the planned developments in 'Ewa (no heavy industrial land uses or zoning are proposed) are not likely to expose people or buildings to explosive or flammable fuels or chemical containers. The planned land uses in East Kapolei are not expected to expose residents of the existing surrounding communities, including, but not limited to, the communities of Waipahu, West Loch, Honouliuli, 'Ewa Villages, 'Ewa, Villages of Kapolei and Makakilo to noxious land uses.

Visual Resources. The planned developments in East Kapolei will change the open space character of the area and introduce urban structures and street trees including the UHWO campus, various types of residences (associated with DHHL, UHWO and the proposed project), commercial/industrial/business centers (associated with DHHL, UHWO and the proposed project), schools, public uses (the Kroc Center, churches) and transportation facilities (such as the North-South Road and in the most visually prominent scenario of high-capacity transit – elevated rail, associated transit stations, a park and ride facility and possibly a rail transit maintenance and storage facility). The East Kapolei developments will include landscaping to reduce the bulk of buildings and structures, and enhance the visual character of the sites. In the case of Ho'opili, open space buffers will reduce the impact of views from the H-1 Freeway, and relatively low-intensive land uses are proposed along Old Weaver Road near Honouliuli Village. Also within Ho'opili, mostly lower density housing is proposed along the 'Ewa Villages Golf Course and along DHHL East Kapolei Development Parcel 2, to maintain the character of these surrounding areas. The planned developments in East Kapolei will permanently replace the open space character of

East Kapolei with a master-planned community as viewed from the existing surrounding communities, including, but not limited to, the communities of Waipahu, West Loch, Honouliuli, 'Ewa Villages, 'Ewa, Villages of Kapolei and Makakilo.

7.2.3. Impacts on the Socio-Economic Environment

Population, Housing, Neighborhood Commercial Uses, and Character/Lifestyle of the Community. *The planned developments (UHWO, DHHL East Kapolei Development Parcels 1 and 2, Kroc Center and Ho'opili) will help to further the growth of the Second City by adding to the critical mass of residential, business/commercial, light industrial/business, open space, parks, schools and other public facilities in 'Ewa, making it a more "complete" community. In the same fashion that many residents in East Honolulu or the Primary Urban Center have no need to leave to visit other districts for essential "goods and services," 'Ewa residents may someday have little need to leave their district. No homes or residents will be displaced by the East Kapolei projects, which will be developed on lands that are currently undeveloped, most of which is being cultivated. The planned developments in East Kapolei will provide a variety of live, work, play, study and shopping opportunities to the existing surrounding communities, including, but not limited to, the communities of Waipahu, West Loch, Honouliuli, 'Ewa Villages, 'Ewa, Villages of Kapolei and Makakilo, which are not currently available on site.*

Economic Impacts and Employment. *As the planned developments in East Kapolei are gradually built out, agricultural lands will be withdrawn from agricultural production, resulting in some loss of revenues, jobs, and payroll. It is likely though, that cultivation is likely to gradually relocate to vacant agricultural land further north of East Kapolei and in Kunia, Central O'ahu, and the North Shore. Over time, the loss of economic productivity from agricultural activity will be more than offset by the construction of the planned developments, which will provide significantly greater revenues, more employment opportunities, and higher payrolls. Local businesses will profit from the developments in 'Ewa, and money spent by workers and businesses will flow through the West O'ahu regional economy particularly in the City of Kapolei. The County and State will benefit from the developments through the generation of real property, income and general excise tax revenues, more than off-setting government services. The planned developments in East Kapolei will provide a variety of live, work, play, study and shopping opportunities to the existing surrounding communities, including, but not limited to, the communities of Waipahu, West Loch, Honouliuli, 'Ewa Villages, 'Ewa, Villages of Kapolei and Makakilo, which are not currently available on site.*

7.2.4. Impacts on Infrastructure Facilities

Water. *Many of the new residents in 'Ewa will have already been residing on O'ahu, thus the demand for water will shift from where they live now on O'ahu to 'Ewa. The 'Ewa projects are being designed assuming to assure that there are adequate sources, storage and transmission facilities to service 'Ewa, without having to reduce source from where future residents currently reside elsewhere on O'ahu and relocate*

AR00027401

the water allocation to 'Ewa. UHWO and Ho'opili will be designed to include dual water systems, allowing new parks, open space and roadway landscaping to be irrigated with recycled water from the Honouliuli Water Reclamation Facility (WRF). The planned developments in East Kapolei are not expected to adversely impact the supply of drinking water for the existing surrounding communities, including, but not limited to, the communities of Waipahu, West Loch, Honouliuli, 'Ewa Villages, 'Ewa, Villages of Kapolei and Makakilo.

Wastewater. Many of the new residents in 'Ewa will have already been residing on O'ahu, thus the need for collection, treatment and disposal of wastewater will shift from where they live now on O'ahu to 'Ewa. The 'Ewa projects are being designed assuming to assure that there are adequate collection, treatment and disposal facilities to service 'Ewa. Where other wastewater treatment facilities on O'ahu do not have the capability to provide recycled water, Honouliuli does. Also, since UHWO and Ho'opili will be designed to include dual water systems, this will allow parks, open space and roadway landscaping to be irrigated with recycled water from the Honouliuli WRF. The planned developments in East Kapolei are not expected to adversely impact the capacity of the existing wastewater system to treat and dispose of wastewater currently being generated from the existing surrounding communities, including, but not limited to, the communities of Waipahu, West Loch, Honouliuli, 'Ewa Villages, 'Ewa, Villages of Kapolei and Makakilo.

Drainage. The Petition Area falls within three different drainage basins. One of these three drainage basins, Kalo'i Gulch, is shared by UHWO, DHHL, Ho'opili and the Kroc Center. The Kalo'i Gulch drainage basin stretches to the top of the eastern slopes of the Wai'anae mountain range and terminates near the ocean in the vicinity of Haseko's Ocean Pointe development. The drainage basin, mauka of the H-1 Freeway, is 3,000 acres and generates a peak flow of 5,000 cubic feet per second (CFS). The drainage basin size increases to 4,330 acres and carries a peak flow of 8,900 CFS at the entrance to 'Ewa Villages. Approximately only 100 acres of the Ho'opili project are within this watershed.

The proposed developments in East Kapolei will increase impervious surfaces such as roadways, roofs, paved parking areas, and sidewalks. These surfaces will cause an increase in storm water discharge within the Kalo'i Gulch drainage basin. However, each of the East Kapolei projects (the proposed Ho'opili project, University of Hawai'i at West O'ahu (UHWO), Department of Hawaiian Home Lands (DHHL) East Kapolei Development Parcels 1 and 2, Kroc Center) will be creating on-site detention basins to collect all storm water runoff and discharge the flow at a rate that will not exceed pre-development conditions. The East Kapolei projects will also be providing storage and detention to meet the Rules Relating to Storm Drainage Standards with respect to water quality standards. The basin size could be decreased at some time in the future when the terminus of Kalo'i Gulch basin is finalized. All projects discharging to the Kalo'i Gulch basin currently have discharge restrictions and these restrictions will continue until the Kalo'i Gulch outlet is opened. Through implementation of the proposed drainage improvements, the planned developments in

East Kapolei are not expected to adversely impact existing developments, including, but not limited to, the communities of Waipahu, West Loch, Honouliuli, 'Ewa Villages, 'Ewa, Ocean Pointe, Villages of Kapolei and Makakilo.

Solid Waste. While many of the new residents in 'Ewa will have already been residing on O'ahu, there will be new residents attracted to and residing in Ho'opili who will be new to O'ahu. As O'ahu's population increases, the capacity of the Waimānalo Gulch Landfill will decrease. The issue of solid waste recycling and ultimate disposal will not only affect 'Ewa, including, but not limited to, the communities of Waipahu, West Loch, Honouliuli, 'Ewa Villages, 'Ewa, Villages of Kapolei and Makakilo, but every resident on O'ahu.

Roadways and Traffic. Ho'opili involves development of a mixed-use community on approximately 1,555 acres in East Kapolei. The Ho'opili Conceptual Land Use Plan ("Plan") reflects the desire for a community that is "complete" with: affordable living options; employment centers; quality schools; shopping, gathering and recreational places; and parks and open space for residents. Implementation of the Plan will allow residents the ability to live, work, learn, play, and shop within Ho'opili without needing to use personal motor vehicles on regional roadways.

Ho'opili will be connected to the surrounding 'Ewa District (and neighboring Department of Hawaiian Home Lands (DHHL), the University of Hawai'i at West O'ahu (UHWO), Kroc Center and the Hawaii Community Development Authority (HCDA) properties by a network of closely-spaced gridded streets and bicycle paths within Ho'opili which allows a variety of circulation options for residents and visitors through East Kapolei. Wider tree-lined boulevards will create a distinct axis running north-south and diagonally east-west across the site, but unlike a conventional subdivision of cul-de-sacs, there will many more streets, sized at a walking scale. Ho'opili is being designed to be transit-ready, and the land use plan, while subject to change, has been designed to accommodate a high-capacity transit corridor either along Farrington Highway or diagonally through the project site, with either one or two transit station locations. While the proposed residential unit count will not change, the land use plan will need to be adjusted depending on the final alignment of the high-capacity transit corridor, as the potential for noise impact from an elevated high-capacity transit alignment would likely require taller, higher density residential or industrial uses along the alignment. The final siting of the transit station location(s) will also provide transit-oriented development potentials, which will also cause the plan to be refined, as higher intensity development (and density) will be concentrated around the transit station(s). Also possible is a transit maintenance and storage facility.

There are several major transportation projects that have been long-planned for East Kapolei. The Ho'opili project has been planned assuming that certain planned transportation projects will be constructed including a portion of North-South Road between Farrington Highway and Kapolei Parkway; a portion of the North-South Road/H-1 Freeway interchange; a portion of the intersection of North-South Road

AR00027402

and Farrington Highway; the long-planned widening of Farrington Highway fronting Ho'opili (and UHWO); the proposed East-West Connector Road through the Petition Area (that would connect Farrington Highway with Fort Weaver Road, through UHWO, DHHL East Kapolei Development Parcel 2 and Ho'opili); and the segment of the proposed Honolulu High-Capacity Transit Corridor project through the Petition Area.

Assuming that mitigation measures are implemented, the result of the analysis indicates that the Ho'opili project would result in what the traffic engineering consultant identifies as significant impacts to only one intersection under Scenario A: With Transit Corridor Scenario; this would occur at Farrington Highway/Leokū Street. Under Scenario B: Without Transit Corridor Scenario, a total of three intersections are anticipated to result in what the traffic engineering consultant identifies as significant impacts as a result of the Ho'opili project: Farrington Highway/Leokū Street, Fort Weaver Road/Old Fort Weaver Road and Fort Weaver Road/Renton Road. Those residents surrounding the project site, including, but not limited to, the communities of Waipahu, West Loch, Honouliuli, 'Ewa Villages, 'Ewa, Villages of Kapolei and Makakilo who travel through the above identified intersections would be most impacted by the proposed project.

7.2.5. Impacts on Public Facilities and Services

Electrical and Communication Facilities. Steam units, diesel units, and gas turbines used to generate electricity also generate emissions and affect air quality. Any increase in demand for electricity not generated by renewable resources will have an indirect impact on air quality. Sustainability guidelines have been developed by UHWO. Sustainability options are being considered for the Ho'opili project.

Ho'opili project buildings, activities, and site grounds are planned to be designed with energy-saving considerations, and the project will strive to be consistent with the State's objective to promote cost-effective energy conservation through the adoption of energy-efficient practices and technologies. Due to the sunny climate, the Petition Area (and the rest of 'Ewa) will be suited for the use of renewable energy technologies including photovoltaics. In addition, based on the Department of Business, Economic Development & Tourism (DBEDT), Strategic Industries Division's recommendations, Ho'opili's mechanical and electrical consultants, in consultation with its sustainability consultant, will be directed to review the City and County of Honolulu's Energy Code early in the project and to consult with Hawaiian Electric Company, Inc. (HECO) on demand-side management programs that offer rebates for installation of energy-efficient technologies. The planned developments in East Kapolei are not expected to adversely impact the availability of energy for the existing surrounding communities, including, but not limited to, the communities of Waipahu, West Loch, Honouliuli, 'Ewa Villages, 'Ewa, Villages of Kapolei and Makakilo.

The planned developments in East Kapolei will also increase the demand for communications services (i.e., cable television and telephone service), but are unlikely to have an adverse effect on existing communications systems for the existing surrounding communities, including, but not limited to, the communities of Waipahu, West Loch, Honouliuli, 'Ewa Villages, 'Ewa, Villages of Kapolei and Makakilo.

Recreational Facilities. The 'Ewa region is the fastest growing region in O'ahu, and the proposed developments in 'Ewa will help to meet the demand for additional recreational facilities. Parks will be provided by Ho'opili to meet the Petition Area's requirements of the City and County of Honolulu's Park Dedication Ordinance. New recreational facilities (i.e., tennis courts, basketball/volleyball courts, and jogging paths) within the UHWO campus are also planned for use primarily by students, faculty, and staff. Additionally, the private developer of UHWO's lands will provide recreational facilities in accordance with the City and County of Honolulu's Park Dedication Ordinance. The DHHL residential subdivision adjacent to and southwest of the Ho'opili community proposes 4.5 acres for park use and 10.7 acres for a community center to be developed and operated by the Salvation Army. The proposed center could include a swimming pool, performing arts center, child care center, gymnasium, education center, game and recreation areas, and other multi-use spaces. The facilities would be available to the general public.

Existing regional park facilities in West O'ahu, Central O'ahu, and Waipi'o may be visited by new residents of the East Kapolei developments; however, other park facilities have long been planned in Kalaeloa. The planned developments in East Kapolei are not expected to adversely impact State and County parks used by residents of the existing surrounding communities, including, but not limited to, the communities of Waipahu, West Loch, Honouliuli, 'Ewa Villages, 'Ewa, Villages of Kapolei and Makakilo.

Medical Facilities. Health care services in the 'Ewa region are provided by Hawai'i Medical Center West (the nearest hospital facility), Pali Momi Medical Center, Wahiawā General Hospital, Kaiser Permanente Waipi'o Clinic, and the recently opened Kapolei Medical Park (located across the Kapolei Shopping Center at the corner of Farrington Highway and Fort Barrette Road). Other routine medical services can be obtained at major hospital facilities in urban Honolulu, about a 30-minute drive from the subject property. The City and County of Honolulu has 18 emergency medical services Advanced Life Support Ambulance units and two Rapid Response Paramedic units on O'ahu. Two of the Advanced Life Support Ambulance units are located nearby, one at the Kapolei Fire Station, the other at the Waipahu Fire Station. One of the Rapid Response Paramedic units is located at the nearby Hawai'i Medical Center West. The proposed UH West O'ahu student center is programmed to include a student health clinic.

The East Kapolei projects will increase the population of Kapolei, and as such, there will be an occasional and unavoidable demand for emergency medical services. It is unlikely, however, that this demand will impact the level of service provided to other residents of O'ahu. Existing medical and healthcare facilities in the 'Ewa region and surrounding areas should be able to accommodate the anticipated increase in

AR00027403

demand. The planned developments in East Kapolei are not expected to adversely impact the availability of medical facilities for the existing surrounding communities, including, but not limited to, the communities of Waipahu, West Loch, Honouliuli, 'Ewa Villages, 'Ewa, Villages of Kapolei and Makakilo.

Educational Facilities. The UH West O'ahu adjacent to and west of the Ho'opili project will be a higher education institution in the 'Ewa region, enabling Leeward and Central O'ahu residents to obtain post-secondary degrees without commuting to the UH Mānoa campus or other higher education institutions in Honolulu.

The demand for educational facilities will increase as the population of 'Ewa grows. The Petitioner is setting aside land for three elementary schools, one middle school, and one high school with Ho'opili. UHWO has set aside land for an elementary school site near its southern boundary that might be shared by residents of the DHHL East Kapolei Development Parcel 1 project. The DHHL East Kapolei Development Parcel 2 project includes one elementary and one middle school sites. The State of Hawaii Department of Education (DOE) is also contemplating a high school on DHHL land immediately north of the UH West O'ahu site. Since the school-aged population is not constant, there is a possibility that not all of the above schools (a total of 2 high schools, two middle schools, and five elementary schools) will be needed after 20 to 25 years (the approximate time frame required for full build out of the combined East Kapolei projects. Through providing required public school sites (and the timely construction of schools by the State DOE), the planned developments in East Kapolei are not expected to adversely impact existing developments, including, but not limited to, the communities of Waipahu, West Loch, Honouliuli, 'Ewa Villages, 'Ewa, Villages of Kapolei and Makakilo. During the public review period, the DOE noted that "...the number of schools required for this project may change if the developer decides to increase residential densities per potential transit-oriented development (TOD) zoning."

Police Protection. East Kapolei is located within Honolulu Police Department (HPD) District 8, which encompasses the leeward coast and the 'Ewa Plain. There are approximately 100 field officers assigned to this district, and response time for the entire district fluctuates between five and seven minutes. In order to meet the growing needs of the 'Ewa Plain communities, in 2000, the City and County of Honolulu opened the Regional Kapolei Police Station at 1100 Kamokila Boulevard.

The East Kapolei projects will increase the population of Kapolei and the demand for police service. According to the Ewa Development Plan, the 'Ewa Villages Substation is planned to service the East 'Ewa region, which includes East Kapolei. The service date for this substation has yet to be determined. The Petitioner is proposing a public facility site immediately mauka of Farrington Highway near the western portion of Parcel B for a use such as a police substation, fire station and/or emergency medical service (EMS) site. The planned developments in East Kapolei are not expected to adversely impact the availability of police protection for the existing surrounding communities, including, but not limited to, the communities of

Waipahu, West Loch, Honouliuli, 'Ewa Villages, 'Ewa, Villages of Kapolei and Makakilo.

Fire Protection. Fire protection in the Ewa Development Plan Area is provided by the Honolulu Fire Department (HFD) 'Ewa Beach Fire Station (an engine company), Makakilo Fire Station (an engine company), and Kapolei Fire Station (an engine and ladder company, and the Battalion 4 Headquarters). The Kapolei Fire Station located in Kapolei Business Park was completed in 1995 to serve the expanding development on the 'Ewa Plain.

The East Kapolei projects will increase the population of Kapolei and the demand for fire service. According to the Ewa Development Plan, to meet the projected population and economic growth in 'Ewa by 2020, three fire stations at 'Ewa Villages, Ko 'Olina, and Makaiwa Hills are planned, however service dates have yet to been determined. A new fire station is being planned on the DHHL East Kapolei Development Parcel 1 site near the intersection of Kapolei Parkway and North-South Road. The Petitioner is proposing a public facility site immediately mauka of Farrington Highway near the western portion of Parcel B for a use such as a fire station, EMS site and/or police substation. The planned developments in East Kapolei are not expected to adversely impact the availability of fire protection for the existing surrounding communities, including, but not limited to, the communities of Waipahu, West Loch, Honouliuli, 'Ewa Villages, 'Ewa, Villages of Kapolei and Makakilo.

5. The Petitioner has been coordinating with the State Department of Health (DOH) Hazard Evaluation & Emergency Response Office (HEER). Based on recent correspondence from HEER, the last two paragraphs of Section 4.5 *Man-Made Hazards* of the EIS will be revised to read as follows:

AR00027404

On March 13, 2008, in an interdepartmental memorandum from the DOH Hazard Evaluation & Emergency Response Office (HEER) to the DOH Environmental Planning Office, HEER wrote: "The land under consideration for development of the Ho'opili Project mixed residential/commercial community was formerly used to grow sugar cane. The Draft EIS acknowledges the presence of potential contamination, and investigative work is being coordinated with the HEER Office." The Petitioner is working with DOH on a sampling methodology to determine the presence and levels of certain pesticides. Subsequent actions will be based on the results of the sampling.

Based on sampling done on the adjacent DHHL property, no impacts from pesticide use on the former sugar cane cultivation of the Petition Area are anticipated. Since the Ewa Plain was once mostly under sugar cultivation and large areas have subsequently been developed for residential use without any apparent ill effects, it is anticipated that future residents in the Petition Area will not be exposed to unacceptable levels of pesticides from past or present agricultural activities. During the public review period, the HEER recommended that soils be tested for residual pesticide contamination and that the presence of potential hazards be evaluated. The scope of the investigative work is currently being coordinated with the HEER Office to ensure that the study will be carried out in the most efficient and effective manner possible.

6. As requested, information on the cost of the project will be expanded to include a breakdown of costs by component (onsite and offsite) and by development phase. Section 2.7 *Development Timetable and Preliminary Costs* of the Draft EIS will be revised to read as follows:

The Petitioner estimates that the development of the Ho'opili project (major off-site and on-site infrastructure improvements including grading, drainage, sewer, safe-drinking water, non-potable water, roadways, landscaping and improvements to Farrington Highway and North-South Road for access) will cost approximately $4.6 billion (in Year 2007 dollars), spent over the project timeline of 2009 – 2030. During the public review period, both the Land Use Commission and the State Office of Planning made reference to subsection 15-15-50, Hawaii Administrative Rules (HAR). Subsection 15-15-50, HAR identifies the form and contents of a petition to the State Land Use Commission to amend the State Land Use District Boundaries, including representing "...that development of the subject property in accordance with the demonstrated need therefore will be accomplished before ten years after the date of commission approval. In the event full urban development cannot substantially be completed within such period, the petitioner shall also submit a schedule for development of the total of such project in increments together with a map identifying the location of each increment, each such increment to be completed within no more than a ten-year period." The construction of Ho'opili's development will be a challenging process that will require ongoing coordination between many fundamental parts. Infrastructure and road access, neighboring property development, demands of the commercial and housing markets, careful continued agriculture and general property management, and economic viability will all be

considered throughout the construction planning process. Furthermore, the City & County of Honolulu's (City) transit project, the largest public works endeavor in Hawai'i's history, will within Ho'opili have its longest traverse through privately owned property and further expand development challenges undoubtedly in unprecedented ways. Many of these parts may involve developing different areas of the project site within the same construction timetable as discussed further below:

Several major development priorities include in no particular order:

- *Water Service from the North. Both of Ho'opili's main potable water storage and transmission systems will reside mauka of H-1. Considerable investment will be required in the construction of tanks and transmission lines that will ultimately service two water zones within Ho'opili that roughly divide the site between northern and southern halves. (Necessary offsite utility easements have already been secured at a price.) Nonpotable water will be sourced from the reclamation operations at the Honouliuli Wastewater Treatment Plant (WWTP), meaning it will be delivered to Ho'opili from the opposite end from where its potable source will come. Preliminary budgetary construction cost estimates range from between $35 million to $40 million with another $20 million possible from BWS for service connections.*

- *Sewer Service from the South. Unlike Ho'opili's main water system, sewer service will come from the southern end of the property. The first of what is expected to be several Joint Development Agreements (JDA) to secure and construct wastewater transmission is in place with DHHL, UHWO, DLNR and the City and funded. Indeed, the DOT has already constructed this line as part of the North-South Road Phase 1A contract. Discussions are expected to commence later this year in earnest on separate JDAs for two additional segments. Nearly $2 million has already been invested to date, preliminary budgetary costs estimates for these two JDAs range from $10 million to $15 million to stub service at the property's southwestern border, $5 million to $10 million to route through to the mauka area and as much as another $60 million for the City's Department of Environmental Services uses connection charges.*

- *Balancing Spread out Access, Initial Infrastructure Needs and Cash Flows. Today, Ho'opili's lands along the Farrington Highway corridor, its northernmost boundary, present Ho'opili's easiest access for construction purposes and future occupants. Once DHHL completes its section of the East-West Connector Road and the State DOT completes the North-South Road (both now under construction), Ho'opili will have construction and occupant access open at its southern and westernmost locations. This is significant because while available for development today, the Farrington Highway corridor is expected to present some of Ho'opili's greatest development challenges, predominantly the distance sewer lines will have to run through undeveloped land for service, as well as timing development to*

AR00027405

the City's planned improvements to Farrington Highway itself. Thus, the Petitioner will look to mobilize on these other areas as early as practicable. Nonetheless, there are several key commercial parcels in this Farrington Highway corridor that will need to be among the earliest to be marketed in order to generate cash flow to support needed upfront utility (such as water and sewer as detailed above) and road infrastructure throughout Ho'opili. As a result, development should be started in more than one area from the onset. Over the build-out of the project, it is expected that as much as $50 million to $60 million could be spent on drainage systems and hundreds of millions will be invested in roadway systems servicing the project.

- ***Balancing Job Generation, Appropriate Initial Housing Deliveries and Transit.*** *The majority of the employment areas within Ho'opili are within the Farrington Highway corridor to the north of the property, while the residential development areas that could be most sensible to develop first – the single-family areas – are to the south. Starting housing construction there could generally preserve higher density development in the areas in and around the transit corridor to the north to be better staged with transit's completion and more appropriately address the various demands it will create.*

- ***Managing Agricultural Operations.*** *As lands are moved into development over time, consideration will have to be given to the significant challenges of maintaining a working agricultural water system and providing ongoing and unencumbered vehicular access to crop areas. This will be no small task, as it will be the objective of the Petitioner to keep active farms onsite as long as practicable.*

As previously stated the development is expected to occur over approximately 20 years. This area of 'Ewa has long been planned for development (Kapolei Area Long Range Master Plan and Ewa Development Plan).

There are several major transportation projects that have been planned for 'Ewa. The Ho'opili project has been planned assuming that certain planned transportation projects will be constructed including a portion of North-South Road between Farrington Highway and Kapolei Parkway; a portion of the North-South Road and a new H-1 Freeway interchange; a portion of the intersection of North-South Road and Farrington Highway; the long-planned widening of Farrington Highway fronting Ho'opili; the proposed East-West Connector Road through the Petition Area; and the first segment of the proposed Honolulu High-Capacity Transit Corridor project through the Petition Area. As major off-site infrastructure (water, sewer, drainage, electrical and communications) would likely occur in most of the above major road right-of-ways, and the exact timing of the completion of these transportation improvements undetermined, it is difficult for the Petitioner to provide a map identifying the phasing of the proposed action in 10 year increments with any degree of certainty. While the phasing of development may be more relevant where there is little or no development, 'Ewa has

rapidly developed in recent years and proposed transportation improvements are indicative of State and County assumptions that this portion of 'Ewa would be eventually developed.

Thank you again for your participation in the Environmental Impact Statement process for this project. Your comment letter and this response will be included in the Final Environmental Impact Statement.

If you have any questions regarding this project, please do not hesitate to contact me at 521-5631.

Sincerely,

PBR HAWAII

Vincent R. Shigekuni

ASB Tower, Suite 650
1001 Bishop Street
Honolulu, Hawaii 96813

Dear Mr. Shigekuni:

Subject: Ho`opili
D.R. Horton-Schuler Homes, LLC
Draft Environmental Impact Statement (DEIS)
`Ewa, Island of O`ahu
TMK(s): 9-1-17: 04 (por.), 059 and 072; and, 35; and
9-1-18: 001 and 004
State Land Use Commission Docket No. A06-771

Thank you for the opportunity to submit comments on the DEIS for the proposed Ho`opili development planned as a mixed use, transit-ready community to include residential, business and commercial areas, transit stops, schools, parks, and open space. The proposed development encompasses approximately 1,553 acres; all of which are proposed to be reclassified from the State Agricultural District to the State Urban District.

The following comments are offered to ensure that the final EIS provides a clear account for the user and decision-maker of site conditions, impacts of the proposed development as identified through studies and comments received in response to the preparation notice, development alternatives, and mitigation measures available. The comments include general observations as well as specific comments related to topic areas of interest to the State.

1. **Inclusion of information from comment letters and studies in the body of the final EIS; increased specificity of mitigation measures.**

The DEIS needs to be reviewed to determine where information provided in the appended comment letters and reference materials should be incorporated within the body of the final EIS. This will enable the reader to view the document and have a more thorough assessment of the potential impacts, alternatives, and mitigation measures

required, without having to cross-reference and extract information contained in the appended materials. The sections, Assessment of the Human Environment, Potential Impacts and Mitigation Measures, and Contextual Issues in the final EIS should include the identification of key measures and techniques that can be used to mitigate impacts.

2. **Development Timetable.**

Table 2.3, Required Permits/Approvals, should be updated to provide estimated timeframes for the necessary permits and approvals. Further, on page 22, the project timeline is identified as 2009-2030. The State Land Use Commission (LUC) requires that projects seeking reclassification be substantially completed within ten years or seek incremental approvals. The final EIS should reference LUC rules (§15-15-50, Hawaii Administrative Rules), a schedule of development for each phase of the total project, and a map showing the location of each increment and the timing of each component.

3. **Alternatives to the Proposed Action.**

The analysis of alternatives in the DEIS, including the "no action" alternative, needs to be more detailed and better developed. The proposed Ho`opili project represents a substantial change to present conditions and therefore the baseline "no action" alternative deserves a more rigorous discussion as do other reasonable alternatives.

4. **Energy.**

Section 4.8.6, Electrical Facilities, provides an overview of existing and projected transmission infrastructure and generating facilities. The assumption being that Hawaiian Electric Company will be the primary provider of power for the development. Mitigation measures that might result in energy efficiency and demand reductions are given very cursory exploration and should be expanded to include discussion of U.S. Green Building Council's (GBC) Leadership in Energy and Environmental Design (LEED) certification, Hawai'i Green Built, and Zero-Net Energy Green Homes.

The DEIS does not discuss the U.S. GBC's LEED for Neighborhood Development (ND) pilot program to which the Ho`opili Project is a participant. The LEED-ND recognizes projects that successfully protect and enhance the overall health, natural environment, and quality of life of communities. The rating system which is used in the program encourages smart growth, promotes efficient energy and water use, and the location and design of neighborhoods to reduce transportation impacts. We understand that a separate consultant, Van Meter Williams Pollack, has been retained to shepherd the Ho`opili project through the LEED-ND certification process. The final EIS should include a preliminary overview of the LEED-ND features to be incorporated into the project using

AR00027407

the current U.S. GBC checklist for the program. Ho`opili is to be commended for pursuing LEED-ND certification during the pilot program period as an early adopter. Providing information on the measures to be incorporated in the project will aid government agencies, decision-makers, and the public in reviewing the project's development applications.

5. **Education.**

The State Department of Education (DOE) is responsible for determining the number of schools required to service a proposed development based on a formula contained in Chapter 302A, Hawaii Revised Statutes. The DEIS identifies the school fair-share requirements as an unresolved issue. The final EIS should provide specific information on the requirements as negotiated between the applicant and DOE.

Currently, the DEIS indicates the project's Conceptual Land Use Plan provides for up to five school sites. DOE has indicated some concerns with the potential traffic impacts of the proposed high school location along Farrington Highway, and the configurations of the lands set aside for school sites. These issues should be addressed in the final EIS.

6. **Agricultural lands.**

The project area is currently in the State Agricultural District and is zoned AG-1 Restricted Agricultural District by the County. The long-range plan for the area is for urban development as part of developing Kapolei as the Second City.

The project area contains approximately 1,500 acres in active agricultural uses on short-term leases. The majority of the project area is ALISH-designated as Prime, and rated A or B by the Land Study Bureau Land Classification system. The proposed development would appear to have a significant impact on the availability of important agricultural lands. Based on the figures provided in Section 3.4, Agricultural Impact, the loss of these high quality agricultural lands is roughly 10% of that available on Oahu. The final EIS should include some discussion about the displacement of the lessees and the location of alternative areas on the Island with comparable costs and access to resources.

7. **Housing.**

The supply of affordable housing to meet the needs of Hawaii's working families is critical to both the State and County. The final EIS should consider and discuss alternative configurations that might increase the affordable housing component and strategies for insuring the continued affordability of housing units developed.

8. **Public Health.**

The DEIS indicates the historic cultivation of sugarcane on the project's lands, as well as the current use for diversified agriculture. These activities have been linked to persistent, long-term chemicals used in cultivation that could pose a threat to public health and the environment. The final EIS should include a determination of the potential risks associated with past agricultural practices on the subject area and any remedial action that needs to be taken.

9. **Solid Waste.**

In the DEIS, Section 4.8.5, Solid Waste Disposal Facilities, does not provide any discussion on plans by the City and County of Honolulu to expand the Waimanalo Gulch Sanitary Landfill or the recent LUC decision to extend the deadline for closing that facility until November 2009. The final EIS should include a discussion of these factors and address the project's solid waste management options.

10. **Drainage.**

The final EIS should include a discussion of low impact development techniques that can be incorporated into the building and site design to improve stormwater management. The Hawaii Coastal Zone Management Program's publication, *Low Impact Development: A Practioner's Guide* (2006), provides examples of design techniques that offer alternatives to conventional drainage plans.

The DEIS identifies that the project is situated within three distinct drainage basins. One of which is Kalo`i drainage basin that has been the subject of considerable attention and currently has agreements in place with other landowners whose runoff may create impacts. The final EIS should reference the specific maximum discharge values that would be allowed into the Kalo`i drainage system, the structural features that will be employed to meet those restrictions, and whether the applicant has or will enter into agreements to abide by those limits.

Drainage from the subject property into the West Loch drainage basin is expected to be addressed through an agreement with the Navy to allow detention and flow on and across their lands. However, to date, the Navy has rejected this idea. The final EIS should provide a definitive answer from the Navy regarding this issue, or the alternative solution to construct sufficient on-site retention basins should be discussed in detail as the anticipated mitigation measure.

AR00027408

11. **Transportation.**

Transportation challenges within the 'Ewa region are significant. The proposed Ho'opili project would be one of the last large-scale developments in the Second City of Kapolei. The State Department of Transportation has expressed ongoing concern regarding the regional traffic congestion along H-2, H-1, Kamehameha Highway, Farrington Highway, Kunia/Fort Weaver Road, and the interchanges.

The DEIS provides some general discussion and the Traffic Impact Analysis Report included in the DEIS as Appendix L provides a more detailed analysis of anticipated impacts to public roadways. The final EIS should include an illustrative figure that identifies the specific roadways, intersections, and freeways that the Ho'opili project will impact, and for which Ho'opili will fund and/or construct mitigation measures.

The Office recommends using the final EIS process as a means to incorporate and use sustainable design and development practices in the proposed project. The Office of Environmental Quality Control's, *Guidelines for Sustainable Building Design in Hawai'i*, and the U.S. GBC's LEED-ND pilot program offer guidelines and checklists for this purpose. The adoption of sustainable building and development practices has long-term economic, social, and environmental benefits to project developers, and Hawaii's residents and communities.

Thank you for the opportunity to review the DEIS and offer comments. The Office of Planning looks forward to receiving the Petitioner's final EIS. If you have any questions, please contact Scott Derrickson, AICP, of the Land Use Division at 587-2805.

Sincerely,

Abbey Seth Mayer

Attn: Mr. Scott Derrickson, AICP

SUBJECT: HO'OPILI DRAFT ENVIRONMENTAL IMPACT STATEMENT

Dear Mr. Mayer:

Thank you for your letter dated April 8, 2008. We have reviewed the State Office of Planning's letter and offer the following response to its comments.

1. **Inclusion of information from comment letters and studies in the body of the final EIS; increased specificity of mitigation measures.** As requested the DEIS will be reviewed to determine where information provided in the appended comment letters and reference materials should be incorporated within the body of the Final EIS. We respectfully disagree with the State Office of Planning's implication that the sections of the DEIS titled: "Assessment of the Human Environment, Potential Impacts and Mitigation Measures" and "Contextual Issues" do not include identification of key measures and techniques that can be used to mitigate impacts as even a cursory review would indicate otherwise.

2. **Development Timetable.** As requested, Table 2.3 *Required Permits/Approvals* of the EIS will be revised to include the estimated timeframes for the necessary permits and approvals (as follows).

Water Use Permit	State of Hawai'i Department of Land and Natural Resources, Commission on Water Resource Management	Application to be submitted prior to Building/Grading Permits	2011

Based on the State of Office of Planning's comments, the last paragraph of Section 2.7 *Development Timetable and Preliminary Costs* of the Draft EIS will be revised to read as follows:

The Petitioner estimates that the development of the Ho'opili project (major off-site and on-site infrastructure improvements including grading, drainage, sewer, safe-drinking water, non-potable water, roadways, landscaping and improvements to Farrington Highway and North-South Road for access) will cost approximately $4.6 billion (in Year 2007 dollars), spent over the project timeline of 2009 – 2030. During the public review

period, both the Land Use Commission and the State Office of Planning made reference to subsection 15-15-50, Hawaii Administrative Rules (HAR). Subsection 15-15-50, HAR identifies the form and contents of a petition to the State Land Use Commission to amend the State Land Use District Boundaries, including representing "...that development of the subject property in accordance with the demonstrated need therefore will be accomplished before ten years after the date of commission approval. In the event full urban development cannot substantially be completed within such period, the petitioner shall also submit a schedule for development of the total of such project in increments together with a map identifying the location of each increment, each such increment to be completed within no more than a ten-year period." The construction of Ho'opili's development will be a challenging process that will require ongoing coordination between many fundamental parts. Infrastructure and road access, neighboring property development, demands of the commercial and housing markets, careful continued agriculture and general property management, and economic viability will all be considered throughout the construction planning process. Furthermore, the City and County of Honolulu's (City) transit project, the largest public works endeavor in Hawai'i's history, will within Ho'opili have its longest traverse through privately owned property and further expand development challenges undoubtedly in unprecedented ways. Many of these parts may involve developing different areas of the project site within the same construction timetable as discussed further below:

Several major development priorities include in no particular order:

- *Water Service from the North. Both of Ho'opili's main potable water storage and transmission systems will reside mauka of H-1. Considerable investment will be required in the construction of tanks and transmission lines that will ultimately service two water zones within Ho'opili that roughly divide the site between northern and southern halves. (Necessary offsite utility easements have already been secured at a price.) Nonpotable water will be sourced from the reclamation operations at the Honouliuli Wastewater Treatment Plant (WWTP), meaning it will be delivered to Ho'opili from the opposite end from where its potable source will come. Preliminary budgetary construction cost estimates range from between $35 million to $40 million with another $20 million possible from BWS for service connections.*

- *Sewer Service from the South. Unlike Ho'opili's main water system, sewer service will come from the southern end of the property. The first of what is expected to be several Joint Development Agreements (JDA) to secure and construct wastewater transmission is in place with DHHL, UHWO, DLNR and the City and funded. Indeed, the DOT has already constructed this line as part of the North-South Road Phase IA contract. Discussions are expected to commence later this year in earnest on separate JDAs for two additional segments. Nearly $2 million has already been invested to date, preliminary budgetary costs estimates for these two JDAs range from $10 million to $15 million to stub service at the property's southwestern border, $5 million to $10 million to route through to the mauka area and as much as another $60*

AR00027410

million for the City's Department of Environmental Services uses connection charges.

- *Balancing Spread out Access, Initial Infrastructure Needs and Cash Flows. Today, Ho'opili's lands along the Farrington Highway corridor, its northernmost boundary, present Ho'opili's easiest access for construction purposes and future occupants. Once DHHL completes its section of the East-West Connector Road and the State DOT completes the North-South Road (both now under construction), Ho'opili will have construction and occupant access open at its southern and westernmost locations. This is significant because while available for development today, the Farrington Highway corridor is expected to present some of Ho'opili's greatest development challenges, predominantly the distance sewer lines will have to run through undeveloped land for service, as well as timing development to the City's planned improvements to Farrington Highway itself. Thus, the Petitioner will look to mobilize on these other areas as early as practicable. Nonetheless, there are several key commercial parcels in this Farrington Highway corridor that will need to be among the earliest to be marketed in order to generate cash flow to support needed upfront utility (such as water and sewer as detailed above) and road infrastructure throughout Ho'opili. As a result, development should be started in more than one area from the onset. Over the build-out of the project, it is expected that as much as $50 million to $60 million could be spent on drainage systems and hundreds of millions will be invested in roadway systems servicing the project.*

- *Balancing Job Generation, Appropriate Initial Housing Deliveries and Transit. The majority of the employment areas within Ho'opili are within the Farrington Highway corridor to the north of the property, while the residential development areas that could be most sensible to develop first – the single-family areas – are to the south. Starting housing construction there could generally preserve higher density development in the areas in and around the transit corridor to the north to be better staged with transit's completion and more appropriately address the various demands it will create.*

- *Managing Agricultural Operations. As lands are moved into development over time, consideration will have to be given to the significant challenges of maintaining a working agricultural water system and providing ongoing and unencumbered vehicular access to crop areas. This will be no small task, as it will be the objective of the Petitioner to keep active farms onsite as long as practicable.*

As previously stated the development is expected to occur over approximately 20 years. This area of 'Ewa has long been planned for development (Kapolei Area Long Range Master Plan and Ewa Development Plan).

There are several major transportation projects that have been planned for 'Ewa. The Ho'opili project has been planned assuming that certain planned transportation projects will be constructed including a portion of North-South Road between Farrington Highway and Kapolei Parkway; a portion of the North-South Road and a new H-1 Freeway interchange; a portion of the intersection of North-South Road and Farrington Highway; the long-planned widening of Farrington Highway fronting Ho'opili; the proposed East-West Connector Road through the Petition Area; and the first segment of the proposed Honolulu High-Capacity Transit Corridor project through the Petition Area. As major off-site infrastructure (water, sewer, drainage, electrical and communications) would likely occur in most of the above major road right-of-ways, and the exact timing of the completion of these transportation improvements undetermined, it is difficult for the Petitioner to provide a map identifying the phasing of the proposed action in 10 year increments with any degree of certainty. While the phasing of development may be more relevant where there is little or no development, 'Ewa has rapidly developed in recent years and proposed transportation improvements are indicative of State and County assumptions that this portion of 'Ewa would be eventually developed.

3. **Alternatives to the Proposed Action.** As requested, the "No Action" of Section 6.1 *"No-Action" Alternative* of the Draft EIS will be revised to read as follows:

6.1 "NO-ACTION" ALTERNATIVE

The "na-action" alternative would not be consistent with stated governmental policies, which direct future growth to the 'Ewa region. The City and County of Honolulu General Plan states:

> *Encourage development within the secondary urban center at Kapolei and the Ewa and Central Oahu urban-fringe areas to relieve developmental pressures in the remaining urban-fringe and rural areas and to meet housing needs not readily provided in the primary urban center.*

Under this alternative, the site would remain as agricultural land, underutilized in terms of meeting the demand for residential homes (including affordable homes) and accompanying land uses. The potential benefit of this alternative is that while remaining under cultivation, the site would provide open space. Implementation of this alternative will avoid: infrastructure impacts (solid waste, wastewater and additional stormwater runoff generated on site); visual impacts (appearance of the site changing from agricultural fields to a master-planned urban development); the loss of agricultural employment; traffic impacts; and construction-related impacts (such as construction noise, construction equipment exhaust emissions, temporary traffic disruption, fugitive dust and soil erosion). Occasionally, however, continued cultivation, harvesting and plowing of the site will expose soils to the erosional forces of wind and rainfall. The demand for housing could result in the following scenarios or combinations thereof: there would be more pressure to develop in the other districts, including the rural areas and other areas currently used for cultivation;

AR00027411

there could be a demand for higher density housing in undeveloped areas of 'Ewa at a density not experienced to date; there would be more "doubling up" (larger number of persons per household, with more than one family under roof); those that are not willing to put up with the previously described scenarios may decide to relocate to the U.S. mainland where housing prices have dropped.

The "no-action" alternative was rejected because it is not consistent with government plans to develop Kapolei as the Second City.

4. **Energy.** Based on the State Office of Planning's comments, the eighth paragraph of Section 4.8.6 *Electrical Facilities, Anticipated Impacts and Mitigation Measures* of the Draft EIS will be revised to read as follows:

Based on DBEDT Strategic Industries Division's recommendations, the Petitioner's mechanical and electrical consultants, in consultation with its sustainability consultant, will be directed to review the City and County of Honolulu's Energy Code early in the project and to consult with Hawaiian Electric Company, Inc. (HECO) on demand-side management programs that offer rebates for installation of energy-efficient technologies (including solar power and energy-efficient appliances). During the public review period the State Office of Planning requested discussion of the following: the U.S. Green Building Council's (GBC) Leadership in Energy and Environmental Design (LEED) certification; Hawaii's Green Built, and Zero-Net Energy Green Homes.

U.S. Green Building Council's (GBC) Leadership in Energy and Environmental Design (LEED) Certification – According to the GBC website: "The Leadership in Energy and Environmental Design (LEED) Green Building Rating System™ encourages and accelerates global adoption of sustainable green building and development practices through the creation and implementation of universally understood and accepted tools and performance criteria. LEED is a third party certification program and the nationally accepted benchmark for the design, construction and operation of high performance green buildings. LEED gives building owners and operators the tools they need to have an immediate and measurable impact on their buildings' performance. LEED promotes a whole-building approach to sustainability by recognizing performance in five key areas of human and environmental health: sustainable site development, water savings, energy efficiency, materials selection and indoor environmental quality." Even though State agencies are directed to implement LEED Silver to the extent possible (under Chapter 196 of the Hawaii Revised Statutes), to date, there have only been a couple of projects built by the State of Hawai'i (Imiloa Astronomy Center, Waipahu Middle School Cafeteria, Hawai'i Gateway Energy Center) so certified.

According to the GBC website: "The LEED for Neighborhood Development Rating System integrates the principles of smart growth, urbanism and green building into the first national system for neighborhood design. LEED certification provides independent, third-party verification that a development's location and design meet

accepted high levels of environmentally responsible, sustainable development. Currently in its pilot period, LEED for Neighborhood Development is a collaboration among USGBC, the Congress for the New Urbanism and the Natural Resources Defense Council. The pilot program is no longer accepting projects. The post-pilot version of the rating system, which will be available to the public, is expected to launch in 2009." Ho'opili is part of the LEED-ND pilot program, and it is in the early stages of working with the U.S. Green Building Council (USGBC) to obtain information required to implement LEED-ND to the extent that it is feasible and practicable.

A preliminary overview of LEED-ND features to be incorporated into the development project site include:

In order to reduce the impacts of urban sprawl, or unplanned, uncontrolled spreading of urban development into areas outside of the metropolitan region, and create more livable communities, LEED for Neighborhood Development communities include:

- *locations that are closer to existing town and city centers,*
- *areas with good transit access, and*
- *sites adjacent to existing development.*

LEED for Neighborhood Development emphasizes the creation of compact, walkable, vibrant, mixed-use neighborhoods with good connections to nearby communities (such as UHWO and DHHL East Kapolei Development 2). Research has shown that living in a mixed-use environment within walking distance of shops and services results in increased walking and biking, which improve human cardiovascular and respiratory health and reduce the risk of hypertension and obesity.

LEED for Neighborhood Development also encourages increased transportation choice and decreased automobile dependence. These two things go hand-in-hand; convenient transportation choices such as buses, trains, car pools, bicycle lanes and sidewalks, for example, are typically more available near neighborhood centers and town centers, which are also the locations that produce shorter automobile trips. All of these concepts are being incorporated into the planning of the Ho'opili project.

Hawaii Builtgreen™ Home Program – According to the DBEDT website: "The 'Hawaii BuiltGreen™ Program' is a statewide program to make it easier for builders and homeowners to design and build energy- and resource-efficient homes in Hawaii. It includes hands-on, right-here-in-Hawaii examples of what to do and how to do it, such as a real home, exhibits, seminars, and workshops." According to the Building Industry Association website, there are no Hawaii BuiltGreen™ Award-winning housing projects built by the State of Hawai'i.

Zero-Net Energy Green Homes – According to Wikipedia: "A zero energy building (ZEB) or net zero energy building is a general term applied to a building with a net

AR00027412

energy consumption of zero over a typical year. Zero energy buildings are gaining considerable interest as a means to cut greenhouse gas emissions and conserve energy... There are many overlapping similarities between the goals of ZEB and GB [Green Buildings]. However, the subtle differences are significant, but diminishing, as scarce knowledge becomes more widespread."

The goal of ZEB design is the reduction, and eventual elimination of, energy bills and greenhouse gas emissions using potentially complex thermal physics necessary for zero energy design.

It is unlikely that there are any net zero energy housing projects built by the State of Hawai'i.

5. **Education.** Unfortunately, we will be unable to provide specific information in the Final EIS on the requirements as negotiated between the Petitioner and the State Department of Education (DOE). During the public review period, DOE wrote: "Please revise the narrative to reflect that the DOE will determine the actual number of schools required for the Ho'opili development after the developer provides more definitive data on respective market prices, size, and number of bedrooms for each type of unit planned." Such information requested by DOE will not be available until after County zoning is approved.

   We are in receipt of the public review comments from DOE on the Draft EIS and they did not indicate in writing any "...concerns with the potential traffic impacts of the proposed high school location along Farrington Highway, and the configurations of the lands set aside for school sites." DOE did however provide information on the desirable configuration for the various campus sites. Revisions to the master plan to accommodate such requests will be incorporated prior to a request for a change in County zoning. The third to the last paragraph of Section 2.5.1 *Ho'opili Conceptual Land Use Plan* of the Draft EIS will be revised to read as follows:

   The proposed project could include as many as five public school sites. The Conceptual Land Use Plan shows the possible locations for five State Department of Education (DOE) school sites planned to be as accessible to the neighborhoods of Ho'opili as the community is developed; one high school, one middle school and three elementary schools. The plan can also accommodate private schools as the need is determined. In addition, area is set aside along the western end of Farrington Highway fronting the Petition Area for either a fire station or a police substation. In total, approximately 100 acres are allocated to meet public facility needs. The master plan will likely be adjusted prior to zoning to achieve DOE-desired public school campus site configurations.

6. **Agricultural lands.** Recently, the Petitioner has been working to assist the tenants in finding a suitable site or sites for relocation (as indicated on page 30 of the Draft EIS). However, to date, no site has been secured for that purpose. Given the planned growth in the region, the leases issued to the existing tenants reflected the fact that the area would be subject to urbanization in the future. The tenants all signed the leases with full knowledge

of the circumstances. In order to assist them in the short term consideration for the land and water were kept at or below market rates.

Hoopili: Impact on Agriculture (Appendix A of the Draft EIS Volume 2) identifies a total of 10,900 acres of former plantation land remaining on O'ahu which are available for other crops, including 3,150 acres of former pineapple land in Kunia and 7,750 acres on the North Shore. It is acknowledged that some of the higher elevation fields in Kunia and on the North Shore have less solar radiation than 'Ewa and lands in higher elevations incur higher pumping costs. Nevertheless, some limitations can be overcome with investment in improvements such as to existing water delivery systems.

7. **Housing.** Alternative configurations that might increase the affordable housing components were noted on pages 57 and 58 of the Draft EIS:

   The majority of Ho'opili's 11,750 residentinl units would consist of for-sale multi-family homes. The Project will also include for-sale single-family units and multi-family rental units. Ho'opili's single-family units would be developed at approximately 5- to 8-units per net acre. Multi-family units will range from low-rise townhome units at approximately 10- to 14-units per acre, to mid-rise development at 30- to 50-units per acre.

   The proposed housing will be in neighborhoods that integrate low- and medium-density or medium- and high-density residential areas. As a result, Ho'opili will cater to a range of income levels. In accordance with the City and County of Honolulu's affordable housing guidelines, up to 30 percent of the total number of units are expected to be developed as affordable housing units.

   Affordable housing unit pricing will need to be coordinated with City and County of Honolulu departments, as pricing will be based on then-prevailing County rules and market conditions. The project is in the planning process so there may be an opportunity to identify a few house lots throughout the proposed project for the development of group homes for persons with special needs.

   ... In addition to home ownership opportunities, the project will provide commercial, educational, and recreational opportunities which will enable residents the opportunity to live, work, learn, play, and shop within the community.

   Furthermore, the requirements for affordable housing on this island are set forth by the City and County of Honolulu and imposed by the City Council in unilateral agreements during the zoning process. In terms of addressing strategies for insuring the continued affordability of housing units to be developed, it is the Petitioner's intent is to comply with all legal requirements concerning affordable housing, including mandatory restrictions on transfer, sale/buyback and use.

8. **Public Health.** We acknowledge that residual pesticides in former agricultural lands could pose potential risks to human health and the environment in a residential setting. HEER

AR00027413

recommends that as part of the pre-development process, the soils be tested for residual pesticide contamination and that the presence of potential hazards be evaluated. The last two paragraphs of Section 4.5, *Man-Made Hazards, Anticipated Impacts and Mitigation Measures* of the Draft EIS will be revised to read as follows:

On March 13, 2008, in an interdepartmental memorandum from the DOH Hazard Evaluation & Emergency Response Office (HEER) to the DOH Environmental Planning Office, HEER wrote: "The land under consideration for development of the Ho'opili Project mixed residential/commercial community was formerly used to grow sugar cane. The Draft EIS acknowledges the presence of potential contamination, and investigative work is being coordinated with the HEER Office." The Petitioner is working with DOH on a sampling methodology to determine the presence and levels of certain pesticides. Subsequent actions will be based on the results of the sampling.

Based on sampling done on the adjacent DHHL property, no impacts from pesticide use on the former sugar cane cultivation of the Petition Area are anticipated. Since the Ewa Plain was once mostly under sugar cultivation and large areas have subsequently been developed for residential use without any apparent ill effects, it is anticipated that future residents in the Petition Area will not be exposed to unacceptable levels of pesticides from past or present agricultural activities. During the public review period, the HEER recommended that soils be tested for residual pesticide contamination and that the presence of potential hazards be evaluated. The scope of the investigative work is currently being coordinated with the HEER Office to ensure that the study will be carried out in the most efficient and effective manner possible.

9. **Solid Waste.** We appreciate the information provided, four new paragraphs will be added to the beginning of Section 4.8.5 *Solid Waste Disposal Facilities, Anticipated Impacts and Mitigation Measures* of the Draft EIS to read as follows:

On March 7, 2008, the State Land Use Commission agreed to allow the City and County of Honolulu's Waimanalo Gulch Sanitary Landfill to remain open for at least 18 more months. The City had sought a 24-month extension, through May 1, 2010.

Waste Management of Hawaii has operated the Waimanalo Gulch Sanitary Landfill as an integral part of the City's solid waste management infrastructure for approximately 20 years. The facility is heavily regulated, monitored and controlled by local, state and federal government agencies.

Before Mayor Hannemann took office, the City Council chose to keep the landfill in its current location, after evaluating a wide range of potential options.

Mayor Hannemann has noted that the recent emergency disposal of 28 tons of recalled beef at the landfill demonstrated that O'ahu will always need such a facility. However, the City and County of Honolulu is striving to decrease the amount of waste that's sent to the landfill, including: expanding the City's curbside residential recycling program; shipping at least 100,000 tons of waste to a mainland facility, and expanding the H-Power garbage-to-energy plant.

10. **Drainage.** Based on the State Office of Planning's comments regarding Low Impact Development, the second to the last paragraph of Section 4.8.4 *Drainage Facilities, Anticipated Impacts and Mitigation Measures* of the Draft EIS will be revised to read as follows:

The project will increase impervious surfaces such as roadways, roofs, paved parking areas, and sidewalks. These surfaces will cause an increase in storm water discharge within the Petition Area. However, detention basins and/or retention basins are being planned and sited to detain and/or retain storm water to ensure that areas downstream of the project are not impacted. Based on comments received from the City and County of Honolulu Department of Facilities Management during the public review period, storm drainage detention and retention basins within the project site shall be privately-owned and maintained, unless particular parcels of land are dedicated to or acquired by the government. During the public review period, the State Office of Planning requested a discussion of low impact development techniques that can be incorporated into the building and site design to improve stormwater management. Table 1.1 of Low Impact Development: A Practitioner's Guide (2006) lists specific Low Impact Development (LID) best management practices (BMP's) and techniques.

- *Preservation of Undisturbed Areas: As recommended, most of the existing undisturbed areas (or uncultivated) areas will be preserved, because the gulches and steeper sloped areas are unsuitable for development. Most of the project area is highly developable, but has been highly disturbed from past and present agricultural cultivation.*
- *Preservation of Buffers: Naturally vegetated buffers will be defined, delineated and preserved along Honouliuli Gulch.*
- *Reduction of Clearing and Grading: Clearing and grading of the site will be limited to the minimum amount for the development function, road access and infrastructure.*
- *Locating Sites in Less Sensitive Areas: Most of the Petition Area is highly developed and does not include sensitive resource areas such floodplains, steep slopes, wetlands, mature forests or critical habitats.*
- *Open Space Design: While the project will be more densely developed than most of the projects in the Villages of Kapolei or the rest of 'Ewa, this project acknowledges that there are very limited areas on O'ahu left to develop and this will allow other areas in Central O'ahu, North Shore, Ko'olauloa, Ko'olaupoko and Wai'anae to remain undeveloped.*
- *Roadway Reduction: The proposed traditional neighborhood design and pedestrian-friendly development concept proposes more but narrower roads than a conventional development, to: 1) ensure lower vehicle speeds; 2) enhance pedestrian safety in crossing the streets; and 3) facilitate safer bicycle travel.*
- *Sidewalk Reduction: The proposed pedestrian-friendly and traditional*

AR00027414

neighborhood design development concept proposes meeting minimum standards for sidewalks to: 1) enhance greater pedestrian use, and 2) facilitate safer bicycle travel for children and inexperienced adult bicyclists. Impervious surfaces could be reduced by consolidating separate pedestrian and bicycle paths into multi-modal paths.

- *Driveway Reduction: The proposed development will strive to minimize driveway lengths and widths to reduce overall imperviousness.*
- *Cul-de-sac Reduction: The proposed pedestrian-friendly, traditional neighborhood design development concept seeks to avoid cul-de-sacs to increase connectivity within the project and to surrounding communities.*
- *Building Footprint Reduction: The proposed transit-oriented development concept is not adverse to taller buildings to reduce the impervious footprint of buildings while recognizing the visual appearance of Kapolei.*
- *Parking Reduction: The proposed mixed-use, pedestrian-friendly and transit-oriented development concept is supportive of reducing the current off-street parking requirements and reducing the overall imperviousness associated with parking lots.*
- *Vegetated Buffer/Filter Strips: Where feasible, runoff will be directed to open space buffers to treat and control stormwater runoff from developed areas.*
- *Open Vegetated Channels: Where feasible, properly designed and constructed vegetated channels will be provided to convey runoff, but it is unlikely that will occur along streets dedicated to the City and County of Honolulu.*
- *Bioretention and Rain Gardens: Where feasible, bioretention and rain gardens will be provided.*
- *Infiltration: Where feasible, infiltration trenches, basins or leaching chambers will be provided.*
- *Rooftop Runoff Reduction Mitigation: Where feasible, runoff will be directed from rooftops to pervious areas.*
- *Stream Daylighting for Redevelopment Projects: Not applicable because there are no previously-culverted/piped streams to "daylight" to restore natural habitats.*
- *Tree Planting: The proposed project will include street trees, park landscaping and project landscaping to reduce stormwater runoff and provide shade.*

In regards to Kalo'i Gulch, as noted on page 90 of the Draft EIS:

> *With respect to the portion of the project within the Kalo'i drainage basin, the project will be creating on-site detention basins to collect all storm water runoff and discharge the flow at a rate that will not exceed pre-development conditions. The project will also be providing storage and detention to meet the Rules Relating to Storm Drainage Standards with respect to water quality standards. The basin size could be decreased at some time in the future when the terminus of Kalo'i basin is finalized. All developed projects discharging to the Kalo'i basin currently have discharge restrictions and these restrictions will continue until the Kalo'i basin terminus is finalized. The portions of the project within the Kalo'i drainage basin are Parcels A and the western most part of Parcel C adjacent to the North-South Roadway alignment (See Figure 4.2: Drainage Basins). The Petitioner will continue to coordinate with County and State agencies to discuss issues within the Kalo'i Gulch Watershed.*

Negotiations between the Petitioner and the Navy regarding the referenced Makai Detention parcels are ongoing. However, please note that the proposed project does not "hinge" upon outlet for the makai detention basin through Navy lands. As noted on page 91 of the Draft EIS, if the outlet is not permitted by the Navy:

> *The alternative drainage solution if the overflow across Navy property cannot be resolved is to construct retention basins on site holding back the total volume of a 100 year- 24 hour storm. These basins would be located on the southern portion of Parcel C.*

11. Transportation. The Petitioner acknowledges that the project is also obligated to provide for and/or implement the traffic mitigation measures and road/highway improvements determined necessary by the DOT Highways Division. We note, however, that the Highways Division is still in the process of concluding its review of the development plan and TIAR for the subject project. As such, the Petitioner will continue to coordinate with the DOT Highways Division on identifying the specific roadways, intersections and portions of freeways that the proposed project may impact, and for which the Petitioner will fund in part and/or construct mitigation measures.

In addition, the Petitioner acknowledges that the project is obligated under the applicable City & County of Honolulu ordinance to participate in and contribute to the Ewa Impact Fee for transportation improvements. This was noted in the third to the last paragraph of Section 4.8.1 *Transportation, Anticipated Impacts and Mitigation Measures* of the Draft EIS.

We concur that OEQC's *Guidelines for Sustainable Building Design in Hawaii* and the USGBC's LEED – ND pilot program provide guidelines for sustainable design and development practices, but the EIS process is intended disclose the impacts of a project. We believe such details are best addressed prior to detailed site planning.

Thank you again for your participation in the Environmental Impact Statement process for this project. Your comment letter and this response will be included in the Final Environmental Impact Statement.

Dear Mr. Shigekuni:

Draft Environmental Impact Statement
Ho'opili, Ewa, Oahu, Hawaii

Thank you for the opportunity to comment on this development. After careful review of the documents for this development, we request that the developer install at least three outdoor warning sirens. As the development plans are finalized, State Civil Defense (SCD) will be better able to define the placement and size of the sirens. At the present time SCD personnel recommends that the minimum-size siren have a sound rating of 121-decibels @ 100 feet, omni-directional and solar powered. Enclosed Figure 2-9, Conceptual Land Use Plan map for the approximate location of the siren coverage area, is marked in red to denote the developer installed sirens in the subdivision, while the black circles denote the existing sirens. (Note: The circles are approximate coverage areas only.)

If you have any questions, please call Mr. Norman Ogasawara, Assistant Telecommunications Officer, at 733-4300, ext. 531.

Sincerely,

EDWARD T. TEIXEIRA
Vice Director of Civil Defense

SUBJECT: HO'OPILI DRAFT ENVIRONMENTAL IMPACT STATEMENT

Dear Mr. Teixeira:

Thank you for your letter dated March 31, 2008. We have reviewed your letter and offer the following response to your comments.

1. We acknowledge the State Civil Defense's (SCD) request that the developer install at least three outdoor warning sirens, with a minimum-size siren sound rating of 121-decibels @ 100 feet, omni-directional and solar powered. The applicant will continue to coordinate with the SCD as development plans are finalized to be better able to define the placement and size of the sirens.

   A new paragraph will be added to the end of Section 3.6 of the EIS to read as follows.

   During the public review period of the Draft EIS, the State Civil Defense (SCD) commented that "the developer install at least three outdoor warning sirens... At the present time SCD personnel recommends that the minimum-size siren have a sound rating of 121-decibels @ 100 feet, omni-directional and solar powered." SCD also noted that "As the development plans are finalized, State Civil Defense (SCD) will be better able to define the placement and size of the sirens." The Petitioner will continue to coordinate with the SCD as development plans are finalized to be better able to define the placement and size of the sirens.

2. Thank you for providing your revised Conceptual Land Use Plan map illustrating the approximate locations for the placement of the sirens.

Dear Mr. Shigekuni:

SUBJECT: Draft Environmental Impact Statement (DEIS) for Ho'opili, Ewa District, Oahu

The Department of Education (DOE) has reviewed the Draft Environmental Impact Statement (DEIS) for Ho'opili. We have the following comments:

Page xii, Executive Summary, Unresolved Issues, State of Hawaii Department of Education School Fair-Share Requirements: Please revise the narrative to reflect that the DOE will determine the actual number of schools required for the Ho'opili development after the developer provides more definitive data on respective market prices, size, and number of bedrooms for each type of unit planned.

Page 48, Section 4.3, Noise, Anticipated Impacts and Mitigation Measures, Operational Noise: Schools should not be located at sites where noise levels exceed 65 dBA.

Page 73, Section 4.8.1 Transportation, Anticipated Impacts: Please address the traffic impacts of locating a high school site along Farrington Highway. The DOE wonders why the traffic analysis did not refer to school traffic impacts in identified locations.

Pages 98-99, Section 4.9.1, Educational Facilities, Existing Conditions: The DOE does not understand why there is a discussion about the average size of some, but not all, schools constructed between 1997 and 2007. Different schools are designed for different enrollment sizes, and once schools open, enrollments change over time. Campus sizes also vary. Historical averages do not determine school design standards.

Page 99, Anticipated Impacts and Mitigation Measures: The DOE questions the appropriateness of stating that a high school in Ho'opili would "attract" residents from areas outside the project.

AR00027418

If the DEIS is referring to high school students, as opposed to home buyers, the DOE determines the attendance area for new schools and has a policy for the granting of geographic exceptions.

Page 226, Section 7, Contextual Issues, Section 7.2.5 Impacts on Public Facilities and Services, Educational Facilities: Please add a sentence in this section that the number of schools required for this project may change if the developer decides to increase residential densities per potential transit-oriented development (TOD) zoning.

The DOE's Educational Specifications state that the length to width ratio of school campuses should not exceed 2.5 to 1. We are concerned that the present ratio of the high school campus is 3.15 to 1. A long, narrow campus would constrain plans for the layout of the future high school. The DOE specifically requests a reevaluation of the shape of the high school campus.

The three elementary school campuses come close to, but do not exceed, the 2.5 to 1 ratio. If it is possible to make the elementary site more square in configuration, we believe there would be more options in planning the facilities on these sites. The configuration of the middle school site is sufficient.

Finally, it is noted that a meeting was held on March 12, 2008, with D.R. Horton – Schuler Division representatives. Preliminary estimates of the educational impacts of the development were discussed.

Should you have any questions, please call Heidi Meeker of the Facilities Development Branch at 377-8307.

Very truly yours,

Patricia Hamamoto

SUBJECT: HO'OPILI DRAFT ENVIRONMENTAL IMPACT STATEMENT

Dear Ms. Hamamoto:

Thank you for your letter dated April 3, 2008. We have reviewed your letter and provide the following responses:

Page xii, Executive Summary, Unresolved Issues State of Hawaii Department of Education (State DOE) School Fair Share Requirements. As requested, the narrative of the EIS will be revised to read as follows:

The Petitioner is currently coordinating with the State DOE regarding the number of schools that will be required for the development of the Ho'opili project. During the Draft EIS public review period, the DOE commented that it will determine the actual number of schools required for the Ho'opili development after the developer provides more definitive data on respective market prices, size, and number of bedrooms for each type of unit planned. This will be identified as an unresolved issue until the number of schools required is finalized.

Page 48, Section 4.3, Noise, Anticipated Impacts and Mitigation Measures, Operational Noise. The last paragraph in this section of the EIS will be revised to read as follows:

The Exterior noise levels at two school sites (H-1 Freeway/Kunia Road and Farrington Highway) will exceed the Hawaii State Board of Education (BOE) Policy 6700 noise limit of L10 = 65 dBA (before mitigation). During the Draft EIS public review period, the DOE commented that schools should not be located at sites where noise levels exceed 65 dBA. Policy 6700 requires that air conditioning be provided to schools that are exposed to exterior noise levels in excess of the noise limit. The layout and construction of the school should be carefully designed such that exterior noise will not disturb learning activities and interfere with speech intelligibility. To reduce ambient noise levels at the school site, traffic noise mitigation measures may also be necessary, such as an earthen berm or noise barrier wall, or siting the buildings along high noise-generating roadways to essentially serve as noise barriers.

AR00027419

Page 73, Section 4.8.1 Transportation, Anticipated Impacts. Please refer to the last paragraph of page 4-3 of the Traffic Impact Analysis Report (TIAR) which is in Appendix L of the DEIS. When the vehicle trips from the proposed project were estimated, the traffic engineering consultant included the estimated number of trips anticipated to be generated by the proposed schools. The estimated numbers of trips generated by school uses are shown on Tables 4-1 and 4-2 of the TIAR. No revisions to the text of the EIS are proposed.

Pages 98-99, Section 4.9.1, Educational Facilities, Existing Conditions. The information provided on these pages of the Draft EIS was an attempt to provide a historical context to show how many acres may be "exacted" from the Petitioner to address impacts to public schools. We concur that historical averages should not determine school design standards, especially as: 1) land values have skyrocketed, 2) residents have become more used to higher density and vertical development; and 3) new developments in professional planning practice have changed from the mindset of protecting residential uses from commercial uses to finding mixed residential and commercial uses as more desirable. The narrative of the EIS will be revised to read as follows:

~~*For planning purposes, the DOE assumes an enrollment of 550 students per elementary school, 600 students per middle school, and 1,000 students per high school. However, in 2007, the Hawaii State Legislature passed Act 245 regarding impact fees for schools. Act 245 defines "Recent School Construction Averages" as the department's historical average acres required and enrollment capacity for elementary (K-5), middle (6-8), and high (9-12). Based on existing school construction data, the historical average design standards are as follows:*~~

~~*Table 4.14, Existing School Construction Data*~~

~~SCHOOL TYPE~~	~~ACRES/SCHOOL~~	~~ENROLLMENT/SCHOOL~~	~~ACRES/STUDENT~~
~~Elementary School~~	~~12.5~~	~~800 students~~	~~.0156 acre~~
~~Middle School~~	~~16.5~~	~~1,500 students~~	~~.0110 acre~~
~~High School~~	~~49.0~~	~~1,600 students~~	~~.0306 acre~~

During the Draft EIS public review period, the DOE commented that "Different schools are designed for different enrollment sizes, and once schools open, enrollments change over time. Campus sizes also vary. Historical averages do not determine school design standards." The Petitioner concurs and proposes to provide a total of 90 acres throughout out the project site that can be planned by DOE for public schools. The Petitioner is working with the DOE so that the larger land area campuses are sited away from mixed-use developments. Schools fitting within a single-block can be sited in higher density areas.

Page 99, Anticipated Impacts and Mitigation Measures. Thank you for pointing out the possible misinterpretation of the noted sentence. The sentence in question will be revised to read as follows:

...A high school will be attractive to certainly ~~attract residents~~ homebuyers from areas outside of Ho'opili. This does not include the possibility that one or two private schools may be included in Ho'opili. If a planned private school(s) is built within the project, this will increase educational choices for local families. UHWO will offer higher education opportunities for regional residents.

Page 226, Section 7, Contextual Issues, Section 7.2.5 Impacts on Public Facilities and Services, Educational Facilities. As requested, the narrative of the EIS will be revised to read as follows:

The demand for educational facilities will increase as the population of 'Ewa grows. The Petitioner is setting aside land for three elementary schools, one middle school, and one high school with Ho'opili. UHWO has set aside land for an elementary school site near its southern boundary that might be shared by residents of the DHHL East Kapolei Development Parcel 1 project. The DHHL East Kapolei Development Parcel 2 project includes one elementary and one middle school sites. The State of Hawaii Department of Education (DOE) is also contemplating a high school on DHHL land immediately north of the UH West O'ahu site. Since the school-aged population is not constant, there is a possibility that not all of the above schools (a total of 2 high schools, two middle schools, and five elementary schools) will be needed after 20 to 25 years (the approximate time frame required for full build out of the combined East Kapolei projects. Through providing required public school sites (and the timely construction of schools by the State DOE), the planned developments in East Kapolei are not expected to adversely impact existing developments, including, but not limited to, the communities of Waipahu, West Loch, Honouliuli, 'Ewa Villages, 'Ewa, Villages of Kapolei and Makakilo. During the public review period, the DOE noted that "...the number of schools required for this project may change if the developer decides to increase residential densities per potential transit-oriented development (TOD) zoning."

We appreciate the information provided on the desirable configuration for the various campus sites. Revisions to the master plan to accommodate such requests will be incorporated prior to a request for a change in County zoning. The third to the last paragraph of Section 2.5.1. *Ho'opili Conceptual Land Use Plan* of the EIS will be revised to read as follows:

The proposed project could include as many as five public school sites. The Conceptual Land Use Plan shows the possible locations for five State Department of Education (DOE) school sites planned to be as accessible to the neighborhoods of Ho'opili as the community is developed; one high school, one middle school and three elementary schools. The plan can also accommodate private schools as the need is determined. In addition, area is set aside along the western end of Farrington Highway fronting the Petition Area for either a fire station or a police substation. In total, approximately 100 acres are allocated to meet public facility needs. The master plan will likely be adjusted prior to zoning to achieve DOE-desired public school campus site configurations.

AR00027420

We acknowledge that the Petitioner has met with DOE on several occasions (the latest meeting on March 12, 2008) to discuss preliminary estimates of the educational impacts of the project as well as the location of proposed school sites.

Thank you again for your participation in the Environmental Impact Statement process for this project. Your comment letter and this response will be included in the Final Environmental Impact Statement. If you have any questions regarding this project, please do not hesitate to contact me at 521-5631.

Sincerely,

PBR HAWAII

Dear Mr. Shigekuni:

Subject: Ho'opili, Oahu
Draft Environmental Impact Statement

Thank you for allowing us to review and comment on the subject Draft Environmental Impact Statement (DEIS). We apologize for submitting our comments after the posted deadline.

The Department of Hawaiian Home Lands (DHHL) offers its support of the proposed project. Construction activities and the retail and industrial components of the Ho'opili master-planned community will give our homestead lessees in Kapolei and the Leeward Coast the opportunity to work close to home.

The DHHL shall continue to cooperate with the D.R. Horton - Schuler Division (Horton) in the development of off-site wastewater collection infrastructure and roadway inter-connectivity between our developments.

Our primary concern with the proposed plan is the potential need for additional access to the North-South Road at the boundary of the subject project site and DHHL's East Kapolei II. There is an existing sixty-foot easement along that boundary, which DHHL intends to develop into a roadway of approximately the same width. We encourage Horton to reserve a similar amount of land on their property for future widening of the roadway.

AR00027421

It would be very helpful to have a map to accompany the internal street descriptions in section 4.8.1 (page 71).

Please call Mr. Darrell Ing in our Land Development Division at 587-6451 if you have any questions.

Aloha and mahalo,

Micah A. Kane, Chairman
Hawaiian Homes Commission

SUBJECT: HO'OPILI DRAFT ENVIRONMENTAL IMPACT STATEMENT

Dear Chairman Kane:

Thank you for your letter dated April 15, 2008 and for your stated support for the proposed project. The Petitioner is extremely grateful for the cooperative effort in developing off-site wastewater collection infrastructure and planning for roadway interconnectivity between the DHHL and Ho'opili projects.

Thank you again for your participation in the Environmental Impact Statement process for this project. Your comment letter and this response will be included in the Final Environmental Impact Statement. If you have any questions regarding this project, please do not hesitate to contact me at 521-5631.

Sincerely,

PBR HAWAII

Dear Mr. Shigekuni:

SUBJECT: Draft Environmental Impact Statement (DEIS) for the Ho'opili Project
Ewa, Oahu, Hawaii
TMK: (1) 9-1-017: 004 and others; 1,553.844 acres

Thank you for allowing us to review and comment on the subject application. The document was routed to the various branches of the Department of Health (DOH) Environmental Health Administration. We have the following Clean Water Branch, Waste Water Branch, Clean Air Branch, Indoor and Radiological Health Branch, and General comments.

Clean Water Branch

The Department of Health, Clean Water Branch (CWB), has reviewed the subject document and offers these comments on your project. Please note that our review is based solely on the information provided in the subject document and its compliance with Hawaii Administrative Rules (HAR), Chapters 11-54 and 11-55. You may be responsible for fulfilling additional requirements related to our program. We recommend that you also read our standard comments on our website at http://www.hawaii.gov/health/environmental/env-planning/landuse/CWB-standardcomment.pdf.

1. Any project and its potential impacts to State waters must meet the following criteria:

   a. Antidegradation policy (HAR, Section 11-54-1.1), which requires that the existing uses and the level of water quality necessary to protect the existing uses of the receiving State water be maintained and protected.

   b. Designated uses (HAR, Section 11-54-3), as determined by the classification of the receiving State waters.

   c. Water quality criteria (HAR, Sections 11-54-4 through 11-54-8).

2. You are required to obtain a National Pollutant Discharge Elimination System (NPDES) permit for discharges of wastewater, including storm water runoff, into State surface waters (HAR, Chapter 11-55). For the following types of discharges into Class A or Class 2 State waters, you may apply for NPDES general permit coverage by submitting a Notice of Intent (NOI) form:

   a. Storm water associated with construction activities, including clearing, grading, and excavation, that result in the disturbance of equal to or greater than one (1) acre of total land area. The total land area includes a contiguous area where multiple separate and distinct construction activities may be taking place at different times on different schedules under a larger common plan of development or sale. An NPDES permit is required before the start of the construction activities.

   b. Treated effluent from leaking underground storage tank remedial activities.

   c. Once through cooling water less than one (1) million gallons per day.

   d. Hydrotesting water.

   e. Construction activity dewatering.

   f. Occasional or unintentional discharges from recycled water systems.

   g. Storm water from a small municipal separate storm sewer system.

   You must submit a separate NOI form for each type of discharge at least 30 calendar days prior to the start of the discharge activity, except when applying for coverage for discharges of storm water associated with construction activity. For this type of discharge, the NOI must be submitted 30 calendar days before to the start of construction activities. The NOI forms may be picked up at our office or downloaded from our website at http://www.hawaii.gov/health/environmental/water/cleanwater/forms/genl-index.html.

3. For types of wastewater discharges not listed in Item 2 above or wastewater discharging into Class 1 or Class AA waters, you may need to obtain an NPDES individual permit. Class 1 waters include, but is not limited to, all State waters in natural reserves, preserves, sanctuaries, and refuges established by the Department of Land and Natural Resources (DLNR) under Hawaii Revised Statutes (HRS), Chapter 195, or similar reserves for the protection of aquatic life established under HRS, Chapter 195.

AR00027423

An application for an NPDES individual permit must be submitted at least 180 calendar days before the commencement of the discharge. The NPDES application forms may be picked up at our office or downloaded from our website at http://www.hawaii.gov/health/environmental/water/cleanwater/forms/indiv-index.html.

4. You must also submit a copy of the NOI or NPDES permit application to the State DLN R, State Historic Preservation Division (SHPD), or demonstrate to the satisfaction of the CWB that SHPD has or is in the process of evaluating your project. Please submit a copy of your request for review by SHPD or SHPD's determination letter for the project along with your NOI or NPDES permit application, as applicable.

5. Page ix of the Executive Summary states: "A grading permit is required to modify the topography, and additionally, a National Pollutant Discharge Elimination System (NPDES) permit will be required prior to construction to address **nnn-point source** discharges." The NPDES permit is for **point source** discharges of pollutants to State waters.

6. Appropriate Best Management Practices (BMPs) must be implemented when disturbing and/or remediating areas contaminated with dioxin, arsenic, or other pollutants. These BMPs must isolate and confine contaminated work areas and ensure compliance with the State's Water Quality Standards (WQS).

7. State waters (including Kaloi Gulch) require the best degree of treatment upland and prior to discharge. State waters shall not be used as treatment. Constructing storage structures and detention basins in State waters is prohibited.

8. Please note that all discharges related to the project construction or operation activities, whether or not NPDES permit coverage and/or Section 401 Water Quality Certification are required, must comply with the WQS. Noncompliance with water quality requirements contained in HAR, Chapter 11-54, and/or permitting requirements, specified in HAR, Chapter 11-55, may be subject to penalties of $25,000 per day per violation.

If you have any questions, please visit our website at http://www.hawaii.gov/health/environmental/water/cleanwater/index.html, or contact the Engineering Section, CWB, at 586-4309.

Waste Water Branch

The document proposes the development of a mixed use community in Ewa – complete with employment centers, quality schools, shopping, gathering and recreational places and parks and open space for residents.

The project is located in the Critical Wastewater Disposal Area (CWDA) where no new cesspools will be allowed. It is also located in the Pass Zone.

We have no objections to the proposal and offer our recommendation for approval as the domestic wastewater needs of the project will be handled by connection to the Honouliuli Wastewater Treatment Plant (WWTP) (as stated that the Petitioner has contributed towards increasing the capacity of the Makakilo/Kapolei Interceptor sewers to the Honouliuli WWTP).

We further encourage the developer to work with the County to utilize recycled wastewater for irrigation and other non-potable water purposes in open space and landscaping areas.

All wastewater plans must meet Department's Rules, HAR Chapter 11-62, "Wastewater Systems." We do reserve the right to review the detailed wastewater plans for conformance to applicable rules. If you have any questions, please contact the Planning & Design Section of the Wastewater Branch at 586-4294.

Clean Air Branch

Fugitive dust emissions occur during all phases of construction and operations. Activities close to existing residences, businesses, public areas or thoroughfares can cause dust problems. For cases involving mixed land use, we strongly recommend that buffer zones be established, wherever possible, in order to alleviate potential nuisance problems. We recommend that the contractors operate under a dust control management plan. The plan does not require the Department of Health approval, however it will help with identifying and minimizing the dust problems from the proposed project.

Examples of measures that can be included in the dust control plan are:

a) Planning the different phases of construction, focusing on minimizing the amount of dust-generating materials and activities, centralizing on-site vehicular traffic routes, and locating potential dust-generating equipment in areas of the least impact;
b) Providing an adequate water resource at the site prior to start-up of construction activities;
c) Landscaping and providing rapid covering of bare areas, including slopes, starting from the initial grading phase;
d) Minimizing dust from shoulders and access roads;
e) Providing adequate dust control measures during weekends, after hours, and prior to daily start-up of construction activities; and
f) Controlling dust from debris being hauled away from the project site.

All activities must comply with the provisions of Hawaii Administrative Rules, §11-60.1-33 on Fugitive Dust. If you have any questions, please contact the Clean Air Branch at 586-4200.

AR00027424

Indoor and Radiological Health Branch

Project activities shall comply with the Administrative Rules of the Department of Health, Chapter 11-46, Community Noise Control. Should there be any questions, please contact Russell S. Takatu, Environmental Health Program Manager, Indoor and Radiological Health Branch, at 586-4701

General

We strongly recommend that you review all of the Standard Comments on our website: www.state.hi.us/health/environmental/env-planning/landuse/landuse.html. Any comments specifically applicable to this project should be adhered to.

If there are any questions about these comments please contact Jiacai Liu with the Environmental Planning Office at 586-4346.

Sincerely,

KELVIN H. SUNADA, MANAGER
Environmental Planning Office

SUBJECT: HO'OPILI DRAFT ENVIRONMENTAL IMPACT STATEMENT

Dear Mr. Sunada:

Thank you for your letter dated April 2, 2008 (your reference: EPO-08-028). We have reviewed your letter and offer the following responses to your comments:

Clean Water Branch

1. The proposed project will comply with Hawaii Administrative Rules (HAR), Chapters 11-54 and 11-55.

2. A National Pollutant Discharge Elimination System (NPDES) permit is required. The need for this permit is stated in the Final EIS on page xiv (Listing of Permits and Approvals Required) and Table 5.9 (Required Permits/Approvals).

   At the appropriate time during the NPDES permit preparation process, the Clean Water Branch will be contacted, and a Notice of Intent will be submitted at least 30 days before the commencement of activities requiring the NPDES permit.

3. If it is determined to be required, an individual NPDES permit will be obtained. We understand that an application for an individual NPDES permit must be submitted at least 180 days before commencement of construction activities.

4. A copy of the NPDES permit application will be submitted to the State Department of Land and Natural Resources, State Historic Preservation Division (SHPD) for review.

5. Page xi of the Executive Summary (previously page ix in the Draft EIS) will be revised as follows:

   A grading permit is required to modify the topography, and additionally, a National Pollutant Discharge Elimination System (NPDES) permit will be required prior to construction to address ~~non-~~point source discharges.

AR00027425

6. Best Management Practices will be implemented to isolate and confined contaminated work areas and be in compliance with the State of Hawai'i's Water Quality Standards (WQS).

7. The proposed project is being planned to include detention basins and/or retention basins to detain and/or retain storm water to ensure that areas downstream of the project are not impacted.

8. We acknowledge that all discharges related to the project construction or operation activities must comply with the WQS.

Waste Water Branch

We acknowledge that the wastewater generated from the project will be disposed of through the connection to the City & County Sewer Service System. As recommended, the Petitioner will work with the City and utilize recycled water for irrigation and other non-potable water purposes in the open spaces and for landscaping areas to the extent practicable. All wastewater plans will conform to applicable provisions of Chapter 11-62, HAR "Wastewater Systems," and the DOH Wastewater Branch reserves the right to review the detailed wastewater plans for conformance to applicable rules.

The following text will be added after the last paragraph of Section 4.8.3 *Wastewater Facilities, Anticipated Impact and Mitigative Measures* of the EIS:

> *All wastewater plans will conform to applicable provisions of Chapter 11-62, HAR, "Wastewater Systems," and the DOH Wastewater Branch reserves the right to review the detailed wastewater plans for conformance to applicable rules. In addition, the Petitioner will work with the Board of Water Supply and utilize recycled water for irrigation and other non-potable water purposes in the open spaces and for landscaping areas to the extent practicable.*

Clean Air Branch

We concur that there is a significant potential for fugitive dust emissions during construction and greatly appreciate the information provided. We have revised the first paragraph of Section 3.3 *Soils, Anticipated Impacts and Mitigation Measures* of the EIS to read as follows:

> *During project construction, there is a potential for soil loss through the generation of dust and water-borne soil erosion as areas are graded. All grading operations will be conducted in accordance with dust and erosion control and other requirements of the City and County of Honolulu Grading Ordinance and all applicable provisions regulating Fugitive Dust set forth under Section 11-60.1-33, HAR regarding. A NPDES permit will also be required prior to construction to address construction-related runoff. Additionally, a watering program will be implemented during construction to minimize soil loss through fugitive dust emission. During the public review period, the Department of Health (DOH) Clean Air Branch (CAB) recommended that a dust control management be prepared. The DOH CAB also provided additional examples of measures that can be implemented during construction:*

> • *where possible, for areas involving mixed land uses, buffer zones be established to alleviate potential dust nuisance problems;*
> • *planning the different phases of construction, focusing on minimizing the amount of dust-generating materials and activities, centralizing on-site vehicular traffic routes, and locating potential dust-generating equipment in areas of the least impact;*
> • *providing an adequate water resource and watering program at the site prior to start-up of construction activities;*
> • *landscaping and providing rapid covering of bare areas, including slopes, starting from the initial grading phase;*
> • *minimizing dust from shoulders and access roads;*
> • *providing adequate dust control measures during weekends, after hours, and prior to daily start-up of construction activities; and*
> • *controlling dust from debris being hauled away from the project site.*

In addition, during the public review period, the Office of Hawaiian Affairs wrote: OHA recommends cleaning job-site construction equipment and establishing groundcover as quickly as possible after grading with native or endemic drought tolerant species. In addition to landscaping and watering programs, other mitigation measures suggested include:

> • *Early construction of drainage control features;*
> • *Construction of temporary sediment basins to trap silt, where needed;*
> • *Use of temporary berms and cut-off ditches where needed; and*
> • *Use of temporary silt fences (coir works well) or straw bales to trap silt.*

Indoor and Radiological Health Branch

Project activities will comply with Chapter 11-46, HAR (Community Noise Control). We have revised the first paragraph of Section 4.3 *Noise, Anticipated Impacts and Mitigation Measures, Construction Noise* of the EIS to read as follows:

> *Noise will be generated by construction and earth-moving equipment during the project's development. However, over the life of the project, depending where development will occur, construction noise will be relatively short-term, occur only during daytime hours, and comply with ~~DOH noise regulations~~ Chapter 11-46, HAR (Community Noise Control). Noise impacts will only be heard on margins of the Petition Area that border sensitive land uses, such as existing residential uses on the eastern boundary (minimal development is currently contemplated along Old Fort Weaver Road) and the southern boundary (buffered by the 'Ewa Villages Golf Course) of the Petition Area. In general, the Petition Area is surrounded by roads or open space; thus there are relatively few current residents that would be impacted by construction noise. There are no adjacent schools or hospitals to the Petition Area.*

The third paragraph of Section 4.3 *Noise, Anticipated Impacts and Mitigation Measures, Operational Noise* of the EIS has been revised to read as follows:

> *The project is designed to have higher densities than the existing Villages of Kapolei, and as such, will present similar ambient noise conditions as might be expected where a mix of*

AR00027426

multi-family residential and commercial uses occur. Noise mitigation measures will be incorporated into the project design to prevent such impacts, such as installing landscaping, and installing mufflers and/or erecting barriers around noisy mechanical equipment (such as air conditioning). Consideration will be given to the layout of the commercial areas to meet State Department of Health noise regulations and reduce the noise impact. It is expected that the Petitioner will likely include restrictions on hours of operations on commercial uses in order to minimize the impact of potential noise producing uses such as bars and nightclubs or indoor recreational land uses. Project activities will comply with Chapter 11-46, HAR (Community Noise Control).

General

The following responses are offered to the Standard Comments on your website: http://www.state.hi.us/health/environmental/env-planning/landuse/landuse.html for the Environmental Planning Office:

- Waterbody type and class: The proposed project is located within three distinct drainage basins: Kalo'i Stream, Hunehune Stream and West Loch. The proposed project does not contain any other wetlands, streams, or known waterbodies onsite.

- National Pollutant Discharge Elimination System (NPDES): A NPDES permit is required for this project. The need for this permit is stated in Table 5.9 of the EIS. The Drainage Master Plan is attached as an Appendix O of the EIS.

- Water quality management: A Drainage Master Plan has been prepared and is attached as Appendix O of the EIS. The proposed drainage system calls for detention basins to help mitigate and filter runoff generated onsite. The drainage system is summarized in Section 4.8.4 *Drainage Facilities* of the EIS.

- Impaired waters of Hawai'i: No water bodies on the current 2004 List of Impaired Waters in Hawaii Prepared under Clean Water Act Section 303 (d) are expected to be impacted by the proposed project.

- We acknowledge your suggestion that we identify and analyze potential project impacts at a watershed scale. Section 4.8.4 *Drainage Facilities, Anticipated Impacts and Mitigation Measures* of the EIS and the Drainage Master Plan describe the proposed drainage system which include detention basins that are consistent with your recommendation to implement alternative and green engineering solutions to mitigate runoff and improve water quality and the project's potential impact on aquatic and riparian ecosystems.

The following responses are offered to the Standard Comments for the Hazard Evaluation and Emergency Response Office:

- We are in receipt of a memorandum dated March 13, 2008 from Mr. Harold Lao from the State of Hawai'i Department of Health Hazard Evaluation & Emergency Response Office (HEER), recommending that as part of the pre-development process,

the soils be tested for residual pesticide contamination and that the presence of potential hazards be evaluated. The the first and second paragraphs of Section 4.5, *Man-Made Hazards, Anticipated Impacts and Mitigation Measures of the EIS* will be revised as follows:

On March 13, 2008, in an interdepartmental memorandum from DOH Hazard Evaluation & Emergency Response Office (HEER) to the DOH Environmental Planning Office, HEER wrote: "The land under consideration for development of the Ho'opili Project mixed residential/commercial community was formerly used to grow sugar cane. The Draft EIS acknowledges the presence of potential contamination, and investigative work is being coordinated with the HEER Office." The Petitioner is working with DOH on a sampling methodology to determine the presence and levels of certain pesticides. Subsequent actions will be based on the results of the sampling.

Based on sampling done on the adjacent DHHL property, no impacts from pesticide use on the former sugar cane cultivation of the Petition Area are anticipated. Since the Ewa Plain was once mostly under sugar cultivation and large areas have subsequently been developed for residential use without any apparent ill effects, it is anticipated that future residents in the Petition Area will not be exposed to unacceptable levels of pesticides from past or present agricultural activities. During the public review period, the HEER recommended that soils be tested for residual pesticide contamination and that the presence of potential hazards be evaluated. The scope of the investigative work is currently being coordinated with the HEER Office to ensure that the study will be carried out in the most efficient and effective manner possible.

We offer the following responses to the Standard Comments for the Clean Air Branch:

- Construction/Demolition Involving Asbestos: Since the majority of the site is currently undeveloped, cultivated for many years for sugarcane, and most recently for diversified agriculture, it is not expected that there may be asbestos on site. However, if asbestos is found, the applicant or subsequent developers will contact the Asbestos Abatement Office in the Noise, Radiation and Indoor Air Quality Branch prior to construction/demolition.

- Control of Fugitive Dust: Discussion of this issue and proposed mitigation measures are provided in Section 3.3 *Soils, Anticipated Impacts and Mitigation Measures* of the EIS.

We offer the following responses to the Standard Comments for the Clean Water Branch:

- In their review of the Environmental Impact Statement Preparation Notice, the Army Corps of Engineers wrote it was unable to provide a determination whether a Department of Army permit would be required for the proposed project. An application for jurisdictional determination will be submitted to the Army Corps of Engineers.

AR00027427

- A National Pollutant Discharge Elimination System (NPDES) permit is required. The need for this permit is stated in the Final EIS on page xiv (Listing of Permits and Approvals Required) and Table 5.9 (Required Permits/Approvals).

  At the appropriate time during the NPDES permit preparation process, the Clean Water Branch will be contacted, and a Notice of Intent will be submitted at least 30 days before the commencement of activities requiring the NPDES permit.

  If it is determined to be required, an individual NPDES permit will be obtained. We understand that an application for an individual NPDES permit must be submitted at least 180 days before commencement of construction activities.

- A copy of the NPDES permit application will be submitted to the State Department of Land and Natural Resources, State Historic Preservation Division (SHPD) for review.

- In response to your comments, the last paragraph of Section 4.8.4 *Drainage Facilities, Anticipated Impacts and Mitigative Measures* has been revised as follows:

  Surface water quality can be impacted through development. Per comments received by the State Department of Health Clean Water Branch, any discharges related to project construction or operation activities shall comply with the applicable State Water Quality Standards as specified in Chapter 11-54, HAR. Further, the DOH Clean Water Branch wrote that the Hawaii Revised Statutes, Section 342D-50(a) requires that "[n]o person, including any public body, shall discharge any water pollutants into state waters, or cause or allow any water pollutant to enter state waters except in compliance with this chapter, rules adopted pursuant to this Chapter, or a permit or variance issued by the director." The project will need to obtain NPDES permits and Grading Permits (as previously identified in the DEIS). Both required permits have substantial effort identified in their applications specifically addressing BMP issues. The substantive parts of the permitting processes focus on BMP tools and monitoring. Features will include: stabilized gravel entrances, siltation berms, diversion of storm water around work areas, use of detention basins, diversion swales, filter traps at catch basins, calculation of soils losses meeting acceptable levels and monitoring plans. BMP's are an important part of current construction practice. The project will be providing detention basins to meet City and County of Honolulu Standards for water quality treatment. Structural methods may also be used to meet water quality requirements of the Rules Relating to Storm Drainage Standards. Structural methods include the use of Stormceptor® type storm drain manholes.

We offer the following responses to the Standard Comments for the Safe Drinking Water Branch:

- Public Water Systems: Discussion of this issue and proposed mitigation measures are provided in Section 4.8.2 *Water Supply Facilities* of the EIS.

- Underground Injection Control: No underground injection wells are proposed for this project.

- Groundwater Protection Program: No 9- or 18-hole golf courses are proposed for this project.

We offer the following responses to the Standard Comments for the Solid and Hazardous Waste Branch:

- Detailed discussion on solid waste management for the project is provided in Section 4.8.5 *Solid Waste Disposal Facilities* of the EIS.

The Standard Comments for the Wastewater Branch listed on your website are the same as the comments included in your letter and are answered above.

For Noise, Radiation, and Indoor Air Quality Branch Standard Comments, the proposed project will comply with the Administrative Rules of the Department of Health.

Thank you again for your participation in the Environmental Impact Statement process for this project. Your comment letter and this response will be included in the Final Environmental Impact Statement. If you have any questions regarding this project, please do not hesitate to contact me at 521-5631.

Sincerely,

PBR HAWAII

FROM: Harold Lao
Hazard Evaluation & Emergency Response Office (HEER)

SUBJECT: Comments from HEER for the Draft EIS for the proposed Ho'opili Project, Ewa, Oahu, Hawaii

The land under consideration for development of the Ho'opili Project mixed residential/commercial community was formerly used to grow sugar cane. The Draft EIS acknowledges the presence of potential contamination, and investigative work is being coordinated with the HEER Office.

Residual pesticides in former agricultural lands could pose potential risks to human health and the environment in a residential setting. As part of the pre-development process, HDOH recommends that soils be tested for residual pesticide contamination and that the presence of potential hazards be evaluated.

Detailed guidance for the investigation of former agricultural lands is currently under preparation. Interim guidance is presented in the HEER office documents referenced below. The HEER office recommends that the developer initiate an environmental investigation of the former agricultural lands as early in the process as possible. Preparation of investigation work plans should continue to be coordinated with the HEER office to ensure that the study is carried out in the most efficient and effective manner possible.

SUBJECT: **HO'OPILI DRAFT ENVIRONMENTAL IMPACT STATEMENT**

Dear Mr. Sunada:

We are in receipt of a memorandum dated March 13, 2008 (your reference: 08-064 RP) from Mr. Harold Lao from the State Department of Health Hazard Evaluation & Emergency Response Office (HEER). We have reviewed the memorandum and offer the following responses to HEER's comments:

We acknowledge that residual pesticides in former agricultural lands could pose potential risks to human health and the environment in a residential setting. HEER recommends that as part of the pre-development process, the soils be tested for residual pesticide contamination and that the presence of potential hazards be evaluated. The second paragraph of Section 4.5, *Man-Made Hazards, Anticipated Impacts and Mitigation Measures* of the Final EIS will be revised to read as follows:

> *Based on sampling done on the adjacent DHHL property, no impacts from pesticide use on the former sugar cane cultivation of the Petition Area are anticipated. Since the Ewa Plain was once mostly under sugar cultivation and large areas have subsequently been developed for residential use without any apparent ill effects, it is anticipated that future residents in the Petition Area will not be exposed to unacceptable levels of pesticides from past or present agricultural activities. <u>During the public review period the HEER recommended that soils be tested for residual pesticide contamination and that the presence of potential hazards be evaluated. The scope of the investigative work is currently being coordinated with the HEER Office to ensure that the study will be carried out in the most efficient and effective manner possible.</u>*

Gentlemen:

Subject: Draft Environmental Impact Statement for Ho'opili

Thank you for the opportunity to review and comment on the subject matter. The Department of Land and Natural Resources' (DLNR) Land Division distributed or made available a copy of your report pertaining to the subject matter to DLNR Divisions for their review and comment.

Other than the comments from Engineering Division, Division of Forestry & Wildlife, Land Division, the Department of Land and Natural Resources has no other comments to offer on the subject matter. Should you have any questions, please feel free to call our office at 587-0433. Thank you.

Sincerely,

COMMENTS

(X) We confirm that the project site, according to the Flood Insurance Rate Map (FIRM), is located in Zones X, A and AE. The National Flood Insurance Program does not have any regulations for developments within Zone X, however, it does regulate developments within Zones A and AE as indicated in bold letters below.

( ) Please take note that the project site, according to the Flood Insurance Rate Map (FIRM), is also located in Zone ____.

( ) Please note that the correct Flood Zone Designation for the project site according to the Flood Insurance Rate Map (FIRM) is ___.

(X) Please note that the project must comply with the rules and regulations of the National Flood Insurance Program (NFIP) presented in Title 44 of the Code of Federal Regulations (44CFR), whenever development within a Special Flood Hazard Area is undertaken. If there are any questions, please contact the State NFIP Coordinator, Ms. Carol Tyau-Beam, of the Department of Land and Natural Resources, Engineering Division at (808) 587-0267.

Please be advised that 44CFR indicates the minimum standards set forth by the NFIP. Your Community's local flood ordinance may prove to be more restrictive and thus take precedence over the minimum NFIP standards. If there are questions regarding the local flood ordinances, please contact the applicable County NFIP Coordinators below:

(X) Mr. Robert Sumitomo at (808) 768-8097 or Mr. Maria Siu Li at (808) 768-8098 of the City and County of Honolulu, Department of Planning and Permitting.

( ) Mr. Kelly Gomes at (808) 961-8327 (Hilo) or Mr. Kiran Emler at (808) 327-3530 (Kona) of the County of Hawaii, Department of Public Works.

( ) Mr. Francis Cerizo at (808) 270-7771 of the County of Maui, Department of Planning.

( ) Mr. Mario Antonio at (808) 241-6620 of the County of Kauai, Department of Public Works.

( ) The applicant should include water demands and infrastructure required to meet project needs. Please note that projects within State lands requiring water service from the Honolulu Board of Water Supply system will be required to pay a resource development charge, in addition to Water Facilities Charges for transmission and daily storage.

( ) The applicant should provide the water demands and calculations to the Engineering Division so it can be included in the State Water Projects Plan Update.

( ) Additional Comments: _____

( ) Other: _____

Should you have any questions, please call Ms. Suzie S. Agraan of the Planning Branch at 587-0258.

Signed: _____

MEMORANDUM

TO: Morris M. Atta
Acting Administrator

FROM: Keith Chun

DATE: March 20, 2008

SUBJECT: Request for comments on Draft EIS for Ho'opili
Ewa, Oahu, Hawaii; TMK (1) 9-1-17: por 4, 59, 72; 9-1-18: 1, 4; 9-1-10:2; por 14; 15; 9-1-17: por 4; 9-2-1: 4, 5, 6, 7; 9-2-2:2

Thank your for the opportunity to review and provide comments on the above mentioned draft EIS. Our comments regarding this application are provided below:

1. DLNR currently owns approximately 183 acres of land near and/or adjacent to the Ho'opili project. These DLNR lands (identified by TMK: (1) 9-1-16:08; (1) 9-1-17:86; and (1) 9-1-18:03 & 05) are all within the State Land Use Urban District boundary and designated as High Density Residential, Community Commercial Center and Transit Node (High Density Residential and Commercial) in the City & County of Honolulu Planning Department's Ewa Development Plan dated August 1997.

   The DLNR parcels have excellent development potential based on the location of these lands adjacent to or near major arteries (H-1 Freeway, Farrington Highway, North-South Road) and the City's proposed transit line as well as the substantial increase in development projects in the area. Consequently, regional infrastructure should take into consideration the potential development of the DLNR parcels, and DLNR requests that it be included in the planning and design of any regional infrastructure in the area that would serve the DLNR parcels. .

If you have any questions, please call Gavin Chun at 587-0385. Thank you.

SUBJECT: HO'OPILI DRAFT ENVIRONMENTAL IMPACT STATEMENT

Dear Mr. Atta:

Thank you for your letter dated April 3, 2008. We have reviewed your letter and it is our understanding that the Draft EIS was distributed to the following divisions:

1. Division of Aquatic Resources (no comments provided);
2. Engineering Division (comments provided);
3. Division of Forestry and Wildlife (comments provided);
4. Commission on Water Resource Management (no comments provided);
5. Land Division – Oahu District (comments provided); and
6. Land Division – Keith Chun (comments provided).

After careful review of your letter, we offer the following responses to comments provided by the respective divisions of your department.

Engineering Division

1. We acknowledge that portions of the project site, according to the Flood Insurance Rate Map (FIRM), are located in Zones X, A and AE; and that while the National Flood Insurance Program does not have any regulations for developments within Zone X, it does regulate developments within Zone A and AE. Based on the DLNR Engineering Division's comments, the following paragraph will be added after Table 3.2 in the Final EIS:

AR00027434

During the public review period, the State Department of Land and Natural Resources Engineering Division confirmed the flood zone designations affecting the Petition Area and wrote that: "The National Flood Insurance Program does not have any regulations for developments within Zone X, however, it does regulate developments within Zone A and AE...Please note that the project must comply with the rules and regulations of the National Flood Insurance Program (NFIP) presented in Title 44 of the Code of Federal Regulations (44CFR), whenever development within a Special Flood Hazard Area is undertaken...Please be advised that 44CFR indicates the minimum standards set forth by the NFIP. Your Community's local flood ordinance may prove to be more restrictive and thus take precedence over the minimum NFIP standards. If there are questions regarding the local flood ordinances, please contact the applicable County NFIP Coordinators below:...Mr. Robert Sumitomo at (808) 768-8096 or Mr. Mario Siu Li at (808) 768-8098 of the City and County of Honolulu, Department of Planning and Permitting..." While it is highly unlikely that any development will be proposed on lands designated Zone A or AE, the Petitioner will continue to coordinate with the Department of Planning and Permitting to discuss project-related issues, including the City's local flood ordinance."

2. As noted above, the project will comply with the rules and regulations of the National Flood Insurance Program (NFIP) presented in Title 44 of the Code of Federal Regulations (44CFR), whenever development within a Special Flood Hazard Area is undertaken. In addition, the Petitioner will continue to coordinate with the Department of Planning and Permitting to discuss project-related issues, including the City's local flood ordinance.

Division of Forestry and Wildlife

1. We acknowledge that the Division of Forestry and Wildlife has no objections to the proposed project. The fourth to the last paragraph in Section 3.7 *Flora, Anticipated Impacts and Mitigative Measures* of the Final EIS will be revised to read as follows:

   None of the plant species which occurred on the Petition Area are considered to be a threatened ~~and~~ or endangered species or a species of concern. During the public review period, the State Department of Land and Natural Resources, Division of Forestry and Wildlife wrote that it had no objections to the proposed project.

2. In addition, the fifth to the last paragraph in Section 3.8, *Fauna, Anticipated Impacts and Mitigative Measures* of the Final EIS will be revised to read as follows:

   The majority of the sites surveyed within the Project Area are lands formerly cultivated in sugarcane or pineapple, having led to high degrees of disturbance or destruction of native habitat. Current habitats are deemed "depauperate" (severely diminished) by the biological consultant. Some of the sites are currently under partial cultivation, but those habitats likewise have been severely degraded. During the public review period, the State Department of Land and Natural Resources,

Division of Forestry and Wildlife wrote that it had no objections to the proposed project.

Land Division – Oahu District

1. We acknowledge that the Land Division – Oahu District has no comments to offer at this time.

Land Division – Keith Chun

1. The Petitioner acknowledges the development potential of the State-owned parcels adjacent to the Ho'opili project. The Petitioner also acknowledges the regional infrastructure request and supports DLNR's being included in the planning and design of any regional infrastructure in the area that would serve the DLNR parcels. Based on DLNR Land Division's comments, the first and second paragraphs of Section 7.2, *Cumulative and Secondary Impacts* of Final EIS will be revised to read as follows:

   This chapter identifies cumulative and secondary impacts that may result from the development of Ho'opili and the East Kapolei region. During the public review period, the State Department of Land and Natural Resources (DLNR), Engineering Division wrote: "DLNR currently owns approximately 183 acres of land near and/or adjacent to the Ho'opili project...The DLNR parcels have excellent development potential based on the location of these lands adjacent to or near major arteries (H-1 Freeway, Farrington Highway, North-South Road) and the City's proposed transit line as well as the substantial increase development projects in the area. Consequently, regional infrastructure should take into consideration the potential development of the DLNR parcels, and DLNR requests that it be included in the planning and design of any regional infrastructure in the area that would serve the DLNR parcels."

   7.2.1 ***Impacts on the Physical Environment***

   Climate, Topography, and Soils. *Planned developments in the East Kapolei region (the proposed Ho'opili project, University of Hawai'i at West O'ahu (UHWO), Department of Hawaiian Home Lands (DHHL) East Kapolei Development Parcels 1 and 2, Kroc Center, and the "DLNR parcels") are not expected to adversely impact regional climate, topography, and soils of existing developments, including, but not limited to, the communities of Waipalu, West Loch, Honouliuli, 'Ewa Villages, 'Ewa Villages of Kapolei and Makakilo. However, within their respective project sites, construction of the East Kapolei developments will impact mostly minor topographic features and soils, and new buildings may affect the respective micro-climate of each building site (by retaining and/or reflecting solar energy and heat, creating shade where none presently exists, or creating "wind tunnels"). Grading operations will comply with DOH regulations and are not expected to adversely impact air and water quality.*

AR00027435

Thank you again for your participation in the Environmental Impact Statement process for this project. Your comment letter and this response will be included in the Final Environmental Impact Statement.

If you have any questions regarding this project, please do not hesitate to contact me at 521-5631.

Sincerely,

PBR HAWAII

Commission on Water Resource Management

SUBJECT: Draft Environmental Impact Statement for Ho'opili

FILE NO.: N/A

Thank you for the opportunity to review the subject document. The Commission on Water Resource Management (CWRM) is the agency responsible for administering the State Water Code (Code). Under the Code, all waters of the State are held in trust for the benefit of the citizens of the State, therefore, all water use is subject to legally protected water rights. CWRM strongly promotes the efficient use of Hawaii's water resources through conservation measures and appropriate resource management. For more information, please refer to the State Water Code, Chapter 174C, Hawaii Revised Statutes, and Hawaii Administrative Rules, Chapters 13-167 to 13-171. These documents are available via the Internet at *http://www.hawaii.gov/dlnr/cwrm*.

Our comments related to water resources are checked off below.

☒ 1. We recommend coordination with the county to incorporate this project into the county's Water Use and Development Plan. Please contact the respective Planning Department and/or Department of Water Supply for further information.

☐ 2. We recommend coordination with the Engineering Division of the State Department of Land and Natural Resources to incorporate this project into the State Water Projects Plan.

☒ 3. There may be the potential for ground or surface water degradation/contamination and recommend that approvals for this project be conditioned upon a review by the State Department of Health and the developer's acceptance of any resulting requirements related to water quality.

Permits required by CWRM: Additional information and forms are available at *www.hawaii.gov/dlnr/cwrm/forms.htm*.

☒ 4. The proposed water supply source for the project is located in a designated ground-water management area, and a Water Use Permit is required prior to use of ground water.

☐ 5. A Well Construction Permit(s) is (are) required before the commencement of any well construction work.

☐ 6. A Pump Installation Permit(s) is (are) required before ground water is developed as a source of supply for the project.

DRF-IA 03/02/2006

AR00027437

☒ 7. There is (are) well(s) located on or adjacent to this project. If wells are not planned to be used and will be affected by any new construction, they must be properly abandoned and sealed. A permit for well abandonment must be obtained.

☐ 8. Ground-water withdrawals from this project may affect streamflows, which may require an instream flow standard amendment.

☐ 9. A Stream Channel Alteration Permit(s) is (are) required before any alteration can be made to the bed and/or banks of a stream channel.

☐ 10. A Stream Diversion Works Permit(s) is (are) required before any stream diversion works is constructed or altered.

☐ 11. A Petition to Amend the Interim Instream Flow Standard is required for any new or expanded diversion(s) of surface water.

☐ 12. The planned source of water for this project has not been identified in this report. Therefore, we cannot determine what permits or petitions are required from our office, or whether there are potential impacts to water resources.

☒ 13. We recommend that the report identify feasible alternative non-potable water resources, including reclaimed wastewater.

☒ OTHER:

The Commission on Water Resource Management (CWRM) would also like to ask that the reuse of storm water and the installation of water efficient fixtures be considered as a means to augment the development's proposed water usage. CWRM also recommends the use of xeriscaping and the planting of drought and salt-tolerant plants to conserve water supplies.

If there are any questions, please contact Jeremy Kimura at 587-0269.

SUBJECT: HO'OPILI DRAFT ENVIRONMENTAL IMPACT STATEMENT

Dear Mr. Atta:

Thank you for your letter dated April 11, 2008. We have reviewed your letter and offer the following responses to comments provided by the Commission on Water Resource Management:

1. As recommended, the Petitioner's civil engineering consultant, Bills Engineering, Inc., has been, and will continue to coordinate with the City and County of Honolulu Board of Water Supply (BWS) to integrate the project into BWS' water use and development plans. A water master plan was prepared for this purpose and was reproduced in its entirety in the Hoopili DEIS Volume II as Appendix M.

2. The State Department of Health (DOH) will be involved in reviewing the project with respect to water quality from the EIS process to actual construction plans. The project will comply with any resulting requirements related to water quality. Per your comments, we have consulted with Tom Nance Water Resource Engineering and we will revise the first paragraph of Section 3.5 *Groundwater Resources/Hydrology, Anticipated Impacts and Mitigation Measures* of Final EIS as follows:

> *The total average daily source requirement for ultimate build-out is estimated at 3.9 MGD. The present agricultural use of the Petition Area provides recharge to the alluvial portion of the caprock from excess applied irrigation water. This irrigation return eventually moves into the aquifer in the upper limestone layer of the caprock, becoming a portion of its recharge, albeit a relatively small portion. According to Tom Nance Water Resource Engineering, development of the Ho'opili project will diminish this small component of the recharge to some extent, but will have an immeasurable impact on water level in the upper limestone layer.*

AR00027438

The project is not expected to impact groundwater resources, as the caprock acts as a barrier to the drinking water in the Petition Area. The caprock in 'Ewa, around Pearl Harbor, and in Honolulu, does function to retard seawater intrusion into the drinking water aquifer in the volcanics. According to Tom Nance Water Resource Engineering, it is an incredibly important contribution to the availability of drinking water which comes about due to the mostly impermeable contact surface between the volcanics and the overlying caprock. It is not due to the water level in the caprock.

Both the drinking water aquifer in the volcanics and the brackish to saline aquifer in the caprock's upper limestone layer are in hydraulic contact with seawater nearshore and offshore. Sea level changes, whether weeks or months long due to large scale whether phenomena in the Pacific or a longer term sea level rise, does cause both aquifers to rise or fall accordingly. According to Tom Nance Water Resource Engineering, the Ho'opili project will have no impact on sea level changes.

Although the Petition Area is situated mauka of the UIC line, no injection wells or cesspools will be installed (since the project's wastewater collection system will eventually connect to the Honouliuli Wastewater Treatment Facility), and any runoff or wastewater disposal required for the project will be managed in full compliance with State Department of Health (DOH) regulations. Irrigation for landscaping will utilize brackish water from the 'Ewa caprock and/or treated effluent (R-1 quality) from the City and County of Honolulu's Honouliuli Wastewater Treatment Facility (if available) to facilitate the recharge of caprock water and to reduce the demand for safe drinking water from the BWS system.

3. As noted on page xiv and Table 5.9 Required Permits/Approvals of the Draft EIS, a Water Use Permit is required for the project. An application will be submitted to CRWM prior to Building/Grading Permits. The only known source of ground water use will be associated with the development of a non-potable water system as generally described in the conceptual Water Master Plan (Appendix M of Hoopili DEIS Volume II).

4. We acknowledge that any wells that are not planned to be used and that will be affected by new construction will be properly abandoned and sealed. A permit for well abandonment will be applied for and processed.

5. As noted in Section 4.8.2 *Water Supply Facilities, Anticipated Impacts and Mitigation Measures* of the Final EIS:

   With respect to non-potable water requirements, the project will be maximizing non-drinking usage to minimize the demand on the safe drinking water system. If a suitable supply is made available, Sstreet right of ways of the Ho'opili project will have underground non-drinking distribution systems. It is proposed to upgrade the existing non-drinking source (EP 5 & 6 located within Parcel C) to a BWS dedicable standard to be used as the source for the non-drinking system. It is also proposed to ultimately allow for future dedication of the non-drinking system. It is estimated that the ultimate non-drinking demand for the project will be approximately 2.1 MGD.

The Petitioner will consider the use of drought tolerant/low water use plants and the implementation of xeriscaping principles for landscaping within the Ho'opili project to the extent practicable. The installation of an efficient irrigation system, possibly using drip irrigation, will be considered in the design of the project where feasible. Moisture sensors to avoid the operation of the system in the rain and if the ground has adequate moisture would be incorporated into the irrigation system, where feasible.

Another source of non-potable water is reclaimed water. The Honolulu Board of Water Supply (BWS) entered into the water recycling business in 2000 by purchasing the Honouliuli Water Reclamation Facility. Water recycling of treated wastewater effluent is one element of a broader BWS strategy to protect O'ahu's aquifers and to conserve water resources through conservation and development of new water supplies. Treated effluent from the facility is now irrigating golf courses that were once using brackish water, including West Loch, 'Ewa Villages, Hawai'i Prince, and Coral Creek. The facility is also providing recycled water (at a different level of treatment) to industries at Campbell Industrial Park.

6. The Petitioner will consider the reuse of storm water and the installation of water efficient fixtures; and is considering the use of xeriscaping and the planting of drought tolerant and salt-tolerant plants to conserve water supplies, where applicable.

   The last paragraph of Section 4.8.2 *Water Supply Facilities, Anticipated Impacts and Mitigation Measures* of the Final EIS will be revised as follow:

   The project will be maximizing the use of non-potable water for irrigation to minimize the impact on the source component of the BWS system. It is proposed that the project's greenbelts, parks and roadway medians use non-potable water for irrigation, if a suitable supply will be available. The BWS Water Resources Division will be contacted regarding the availability of recycled water and other non-potable water supplies. A Conceptual Water Master Plan addressing safe drinking and non-potable water facilities has been prepared and reproduced in its entirety and attached to this EIS as Appendix M ~~will be submitted to~~ for BWS ~~for its~~ review and approval. In addition, construction drawings will be submitted to BWS for its review and approval. During the public review period of the Draft EIS, the DLNR Commission on Water Resource Management requested that "the reuse of storm water and installation of water efficient fixtures be considered" and recommended "the use of xeriscaping and the planting of drought tolerant and salt-tolerant plans to conserve water supplies."

Thank you again for your participation in the Environmental Impact Statement process for this project. Your comment letter and this response will be included in the Final Environmental Impact Statement.

Mr. Vincent Shigekuni
Vice President
PBR Hawaii & Associates, Inc.
ASB Tower, Suite 650
1001 Bishop Street
Honolulu, Hawaii 96813

Dear Mr. Shigekuni:

Subject: Ho'opili
D.R. Horton – Schuler Homes, LLC
Draft Environmental Impact Statement (Draft EIS)
Petition Area: TMK: 9-1-17: 04 (portion), 59, and 72; 9-1-18: 01 and 04.
Remainder of the Project Area: TMK: 9-1-10: 02, 14 (portion), and 15 (portion); 9-1-17: 04 (portion); 9-2-01: 04, 05, 06 and 07; and 9-2-02: 02

The Department of Transportation (DOT) submits the following comments on the subject project as presented in the Draft EIS:

1. The DOT's prior comments related to the project's EIS Preparation Notice in letter STP 8.2450 dated April 9, 2007 and your response in letter February 8, 2008 (copies attached) on the project's transportation impacts are still valid and applicable to the subject Draft EIS. To summarize:

   a. Occasional aircraft overflights and aircraft single-event noise may occur. Prospective occupants should be made aware of the potential for such occurrences.

   b. The project's location next to the State highways, proposed direct accesses and connections to a State highway, and contribution of additional traffic in the area and onto the highways require project and regional traffic mitigation measures and road/highway improvements.

   c. Drainage systems, other project construction plans and work affecting the highway right-of-ways require prior DOT review and approval.

AR00027440

2. The subject project is one of several major land developments scheduled to occur in the Kapolei-Ewa region, including projects in Makakilo and Kunia, around the same 2010-2030 time period. The subject project itself will create significant transportation impacts and further contribute to collective regional impacts, which will produce even greater cumulative impacts. Both these impacts, as well as the influence of the Honolulu High-Capacity Transit project, must be addressed.

   The project is obligated under the applicable City & County of Honolulu ordinance to participate in and contribute to the Ewa Impact Fee for transportation improvements.

   The project is also obligated to provide for and/or implement the traffic mitigation measures and road/highway improvements determined necessary by the DOT Highways Division. The Highways Division is in the process of concluding its review of the development plan and TIAR for the subject project. When the analysis is completed, the Highways Division will contact your firm.

Due to the significant impacts associated with the subject project, the DOT feels that further analysis and evaluation of the transportation factors is necessary. Thank you for the time and opportunity afforded to review the project plans and TIAR. Your continued cooperation is appreciated.

Very truly yours,

BRENNON T. MORIOKA, PH.D., P.E.
Director of Transportation

Attach.

IN REPLY REFER TO:

STP 8.2450

April 9, 2007

Mr. Vincent Shigekuni
PBR Hawaii & Associates, Inc.
ASB Tower, Suite 650
1001 Bishop Street
Honolulu, Hawaii 96813

Dear Mr. Shigekuni:

Subject: Ho'opili
D. R. Horton – Schuler, LLC
EIS Preparation Notice for LUC Petition No. A06-771 Filing
TMK: 9-1-17: 04 (portion), 59, and 72; 9-1-18: 01 and 04;
9-1-10: 02, 14 (portion), and 15 (portion) and 9-2-02: 02, and
(portion), 04, 05, 06 and 07

Thank you for providing the notification on the subject proposed land development project. We have the following initial comments as an interested party:

1. The site of the project is not directly under aircraft flight paths for Kalaeloa Airport or Honolulu International Airport. However, the developer and prospective residents/occupants should be advised and made aware that single-event noise may occur from potential overflights of aircraft or under certain weather/atmospheric conditions, particularly from aircraft approaching or departing Kalaeloa Airport.

2. The development of the project will have a significant traffic impact on our highway facilities in the Kapolei-Ewa region. The developer should prepare and submit a traffic impact analysis report (TIAR). The TIAR should cover both project traffic impacts and the cumulative traffic impacts to the community and region, which the project will be contributing to, including the existing and future road network in the area. Accesses and connections to any State highway also need to be identified. The TIAR should provide recommended and required transportation mitigation measures and roadway improvements to address the impacts, including the developer's participation in and contribution to provide the mitigation measures and improvements. We will need to review and approve the TIAR.

AR00027441

3. We should be included in agency reviews and approvals of the drainage plans for the subject project.

4. Any construction work by or for the subject project that can affect a State highway and/or can occur within or adjoin a State highway right-of-way will need our prior review and approval.

We will defer any other additional comments on the subject project until we receive and have the opportunity to review more information on the project. We would appreciate receiving at least five (5) copies of any report or document on the project for review by our operating divisions.

We appreciate the opportunity to provide our comments.

Very truly yours,

BARRY FUKUNAGA
Interim Director of Transportation

SUBJECT: HO'OPILI DRAFT ENVIRONMENTAL IMPACT STATEMENT

Dear Mr. Morioka:

Thank you for your letter dated April 7, 2008 (your reference: STP 8.2831). We have reviewed your letter and offer the following responses to your comments:

1. We acknowledge that the Department of Transportation's prior comments related to the project's EIS Preparation Notice in letter STP 8.2450 dated April 9, 2007 and our response in a letter dated February 8, 2008 on the project's transportation impacts are still valid and applicable to the DEIS. Specifically:

   a. We acknowledge that single-event noise may occur from potential overflights of aircraft or under certain weather/atmospheric conditions, particularly from aircraft approaching or departing Kalaeloa Airport. Prospective occupants will be made aware of the potential for such occurrences. The third to the last paragraph of Section 4.3 *Noise, Anticipated Impacts and Mitigation Measures* of the EIS will be revised as follows:

      Aircraft noise due to operations at nearby Kalaeloa Airport and the Honolulu International Airport may be audible at the project site. However, flights directly above the site are infrequent and the project site is outside of the Ldn 55 noise contour for both airports. Therefore, a significant noise impact due to aircraft noise is not expected. <u>However, per the comments made by the State Department of Transportation during the Draft EIS public review period, prospective occupants will be made aware of the potential for such occurrences.</u>

   b. Proposed traffic mitigation measures were identified on pages 79 through 84 of the DEIS.

   c. We acknowledge that drainage systems, other project construction plans and work affecting the highway right-of-ways require prior DOT review and approval. The second paragraph in Section 2.6 *Infrastructure Improvements* of the EIS will be revised as follows:

AR00027442

> *Major on-site infrastructure improvements required for the project include: facilities for water transmission and distribution; wastewater collection; traffic circulation; drainage; and electrical and communication systems. It is possible that one or more micro-utility companies may be providing a portion or all of the electrical and/or communication systems for the project. For instance, there are companies that can install solar photovoltaic panels on buildings for free in return for charging lower electrical rates than HECO. While the specific nature of each improvement is not known at this time, the EIS is intended to address all current and future instances involving the use of State and/or County lands and funds relating to the Ho'opili project, including micro-utility companies that may require the use over State and/or County lands to operate and maintain any utility lines or facilities. Per comments made by the State Department of Transportation during the Draft EIS public review period, drainage systems, other project construction plans and work affecting the highway right-of-ways require prior DOT review and approval.*

2. We acknowledge your concern that the project will create significant transportation impacts and further contribute to collective regional impacts, which will produce even greater cumulative impacts. The cumulative impacts of the project and other projects in the area were addressed in the Traffic Impact Analysis Report prepared by Wilbur Smith & Associates (February 2008), which was reproduced in its entirety in the DEIS as Appendix L and summarized in Section 4.8.1 *Transportation* of the DEIS.

   We acknowledge that the project is obligated under the applicable City & County of Honolulu ordinance to participate in and contribute to the Ewa Impact Fee for transportation improvements. This was noted in the third to the last paragraph of Section 4.8.1 *Transportation, Anticipated Impacts and Mitigation Measures* of the DEIS.

   Furthermore, we acknowledge that the project is also obligated to provide for and/or implement the traffic mitigation measures and road/highway improvements determined necessary by the DOT Highways Division. We acknowledge that the Highways Division is in the process of concluding its review of the development plan and TIAR for the subject project. As such, the Petitioner will continue to coordinate with the DOT Highways Division during the design of the project.

Thank you again for your participation in the Environmental Impact Statement process for this project. Your comment letter and this response will be included in the Final Environmental Impact Statement. If you have any questions regarding this project, please do not hesitate to contact me at 521-5631.

Sincerely,

PBR HAWAII

Dear Mr. Shigekuni:

SUBJECT: Draft Environmental Impact Statement for the Ho'opili Project Ewa, O'ahu, Hawaii

Thank you for the opportunity to review and comment on the Ho'opili Project Draft Environmental Impact Statement (DEIS). In 2002, the State Legislature transferred the responsibility for the planning and redevelopment of the Kalaeloa Community Development District (KCDD) to the Hawaii Community Development Authority (HCDA). Given the scope and impact of the Ho'opili project upon the Kapolei Ewa region it is my hope that the live, work and play objectives of the Kalaeloa Master Plan will be coordinated with your project.

The HCDA supports the development of an internal network of closely-spaced gridded streets and bike paths linking the project to the surrounding communities of University of Hawaii West Oahu (UHWO), Department of Hawaiian Homes Land (DHHL), Ewa Villages, and the KCDD. This objective is consistent with the HCDA Kalaeloa Master Plan. Improving connectivity throughout the region was one of the most important issues identified during the strategic planning meetings for the region as well as the KCDD. The extension of the Kapolei Area Bikeway Plan to include UHWO, DHHL, and the KCDD in the DEIS is also noteworthy and consistent with our Master Plan.

Thank you for the opportunity to comment on the DEIS. Should you require clarification, please contact Tesha Malama via email at tesha@hcdaweb.org or at 520-2686.

Sincerely,

Anthony J. H. Ching

SUBJECT: HO'OPILI DRAFT ENVIRONMENTAL IMPACT STATEMENT

Dear Mr. Ching:

Thank you for your letter dated April 7, 2008 (your reference number: PL Kalaeloa 17.1.1). We greatly appreciate your letter and your agency's participation in our meetings with the University of Hawai'i at West Oahu, the Department of Hawaiian Home Lands, the Kroc Center and others. The fourth paragraph of the Executive Summary of the EIS will be revised to read as follows:

> *Ho'opili is planned to be connected to the surrounding 'Ewa District (and neighboring DHHL, UHWO and HCDA properties) by a network of streets and bicycle paths which should allow a variety of circulation options for residents and visitors. During the public review period, the Hawai'i Community Development Authority (HCDA) wrote that: "The HCDA supports the development of an internal network of closely-spaced gridded streets and bike paths linking the project to the surrounding communities of University of Hawaii West Oahu (UHWO), Department of Hawaiian Home Lands (DHHL), Ewa Villages, and the KCDD. This objective is consistent with the HCDA Kalaeloa Master Plan. Improving connectivity throughout the region was one of the most important issues identified during the strategic planning meetings for the region as well as the KCDD. The extension of the Kapolei Area Bikeway Plan to include UHWO, DHHL, and the KCDD in the DEIS is also noteworthy and consistent with our Master Plan."*

> *Wider tree-lined boulevards are intended to create a distinct axis running north-south and east-west across the site. Ho'opili is being designed to be transit-ready, and the land use plan, while subject to change, has been designed to accommodate a high-capacity transit corridor either along Farrington Highway or diagonally through the project site, with either one or two transit station locations. Also possible is a transit maintenance and storage facility. While the proposed residential unit count should not materially change, it will need to be adjusted depending on the final alignment of the high-capacity transit corridor, as ridership generation, "capture" of transit-oriented development potential and the potential for noise impact from an elevated high-capacity transit alignment would likely require taller, higher density residential or industrial uses along the alignment. The final siting of the transit station location(s) will concentrate higher intensity development (and density) around the transit station(s). A site for a transit maintenance and storage facility is also possible. (As of this writing, the City and County of Honolulu (City) has begun work on the Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor (HHCTC) project, with a target publication date in the second quarter of 2008. By the time the HHCTC Draft EIS is published, the final alignment of the high-capacity transit corridor, the location of transit stations, and the location of the transit maintenance and storage facility will be known).*

Thank you again for your participation in the Environmental Impact Statement process for this project. Your comment letter and this response will be included in the Final Environmental Impact Statement. If you have any questions regarding this project, please do not hesitate to contact me at 521-5631.

Sincerely,

PBR HAWAII

RE: Ho'opili Draft Environmental Impact Statement (DEIS) and Reclassification of Land from Agricultural to Urban, 'Ewa District, O'ahu, TMKs: 9-1-17: 04, 59, and 72; 9-1-18:01 and 04; 9-1-10: 02, 14 and 15; 9-1-17:04; 9-2-01:04, 05, 06 and 07; and 9-2-02:02.

Dear Mr. Shigekuni,

The Office of Hawaiian Affairs (OHA) is in receipt of the above referenced request for comments concerning a DEIS for the proposed Ho'opili development and reclassification of 1,553.844 acres of land from agricultural to urban in the 'Ewa District on O'ahu. We offer the following comments:

OHA understands, and as the applicant has pointed out, that the City and County of Honolulu is in a housing crisis and our collective population is expected to grow in the foreseeable future.[1] We also understand that the amount of available land for our homes is scarce. Naturally, this puts us all in a bind. However, OHA fundamentally cannot support a project that proposes to remove the best and most highly-protected agricultural lands on this island from current and active production. OHA notes that these lands have been described as the "'golden triangle" on O'ahu, and that they have historically been some of the most productive and consistent agricultural lands in our State.[2]

[1] See page 12 of the DEIS.

[2] See, http://www.honoluluadvertiser.com/apps/pbcs.dll/article?AID=/20080331/NEWS01/803310303/0/NEWS01, posted on March 31, 2008.

OHA stresses that this land is zoned Agriculture A-1 which requires that the greatest possible protection be given to these lands. (see Hawaii Revised Statutes Section 205) OHA is deeply concerned that this area be used for agricultural uses only. Our concerns are echoed by the myriad of laws and legislation supporting a strong agricultural economic base and retention of those lands primarily in agricultural pursuits in the specific project area. (see Hawaii Revised Statutes, Section 205, O'ahu General Plan and Sustainable Communities Plan; Section 1-115 of the City Subdivision Rules and Regulations; the State Coastal Zone Management Act; and even the city's 'Ewa Development Plan, last updated in 2000, which emphasizes that high-value farmland be preserved for agriculture for 3,000 acres in the general project area.) OHA stresses that only accessory agribusiness activities which meet the above intent are to be permitted in this area.

Hawaii Revised Statutes section 205-2 states that, "In the establishment of agricultural districts the greatest possible protection shall be given to those lands with a high capacity for intensive cultivation". That is exactly the kind of land that this project proposes to use and as such, OHA cannot reasonably see how the removal of 1,553.844 acres of prime agricultural lands currently in use does not run afoul of state and county land use plans, controls and policies.

Further, Hawaii Revised Statutes section 205-41 states;

> It is declared that the people of Hawaii have a substantial interest in the health and sustainability of agriculture as an industry in the State. There is a compelling state interest in conserving the State's agricultural land resource base and assuring the long-term availability of agricultural lands for agricultural use to achieve the purposes of:
>
> (1) Conserving and protecting agricultural lands;
>
> (2) Promoting diversified agriculture;
>
> (3) Increasing agricultural self-sufficiency; and
>
> (4) Assuring the availability of agriculturally suitable lands pursuant to article XI, section 3, of the Hawaii state constitution.

In 1961, the Committee on Lands and Natural Resources remarked that its goal in creating the State Land Use Commission was primarily to "protect productive

AR00027445

agricultural lands…through state zoning."[3] The high value assigned to agriculture lands was emphasized again by the 1976 legislature when they assigned Class A and B agricultural lands "additional protection…[against county approval of] agricultural subdivisions."[4]

Further, and as mentioned in Hawaii Revised Statutes section 205-41, even our state constitution emphasizes that:

> The State shall conserve and protect agricultural lands, promote diversified agriculture, increase agricultural self-sufficiency and assure the availability of agriculturally suitable lands. The legislature shall provide standards and criteria to accomplish the foregoing.
>
> Lands identified by the State as important agricultural lands needed to fulfill the purposes above shall not be reclassified by the State or rezoned by its political subdivisions without meeting the standards and criteria established by the legislature and approved by a two-thirds vote of the body responsible for the reclassification or rezoning action.

Additionally, and as the applicant knows, most of the soils in the project area are rated A or B. This is significant because A and B soil classified agriculture lands have additional layers of protection given to them in Hawaii Revised Statutes section 205-4.5 (16)(b) which does not allow a county to approve a subdivision of these lands unless subdivision is made subject to restrictions that keep them in agricultural use.

OHA realizes that housing is an important issue for our beneficiaries and a difficult one for this State. This is why we seek to improve upon environmental review documents such as these so that public input can be considered; impacts mitigated and proposed projects become the best that they can be. This is also why we urge the applicant to provide us with additional alternatives analysis. The heart of an environmental review document is its discussion of alternatives. OHA seeks to find a rigorous and objective analysis of all reasonable alternatives to the proposed action, including a discussion of the "no action" alternative as a base-point to which the proposed action can be compared. This was not done in this case. The Alternatives Analysis section of the Executive Summary is nine lines long and the Alternatives to the Proposed Action section (6.0) of

[3] S. Stand. Comm. Rep. 850, 1st Leg., Gen. Sess. (1961), reprinted in 1961 Haw. Sen. J. 883, 883. From Avoiding the Next Hokuli'a, Adrienne Suarez, 27 UH L. Rev. 441.

[4] S. Conf. Comm. Rep. 2-76, 8th Leg., Reg. Sess. (1976), reprinted in 1976 Haw. Sen. J. 836, 836. From Avoiding the Next Hokuli'a, Adrienne Suarez, 27 UH L. Rev. 441.

the DEIS is but four pages long. A proposed action of this magnitude dealing with an issue of this importance requires more attention than:

> Further study or delay of any proposed development on the property would not be consistent with the *Ewa Development Plan* or the County's objective of directing growth to 'Ewa. Therefore, various alternatives for the site were rejected…."

OHA notes that being in a hurry or citing previous studies is not reason to skirt an alternatives analysis. Neither is an arrangement of consistent goals, as there are just as many land use policies and goals (if not more) that the applicant proposes to violate. OHA understands that this issue is a difficult one; however, as this is the applicant's proposed project we ask them to provide valid alternatives analysis for review and public comment in order to make this a better project and avoid further unnecessary costs.

In terms of housing, OHA additionally notes that according to the Center on Budget and Policy Priorities webpage, (http://www.cbpp.org/4-17-06sfp.htm); as of April 2006, the poverty level for a two-parent family of four in Hawaii is $19,961. As such, we ask how many of the applicant's proposed homes will be made to be affordable and to what standard is affordable defined.

Regarding drainage, OHA notes that Kalo'i Gulch is proposed to be shared by all of the current users and the University of Hawai'i at West O'ahu, the Department of Hawaiian Homelands, the Kroc Center, Haseko's Ocean Pointe development as well as the applicant. Therefore, we will hold the applicant to their statement made on page 223 of the DEIS that discharge flow rates will not exceed pre-development conditions and that the rules relating to water quality standards will be adhered to. However, we do seek clarification on this point because page x of the DEIS states, "Over time the project will result in an increase in wastewater being generated that currently being generated on-site (by agricultural activities)."[5] OHA is also confused as to whether discharge rates will not exceed pre-development conditions because of the statement on page xi: "The project will increase impervious surfaces such as roadways, roof, paved parking areas, and sidewalks. These surfaces will cause an increase in storm water discharge within the Petition Area."[6]

[5] Page 91 of the DEIS also makes a similar statement.

[6] Page 223 of the DEIS also makes a similar claim. OHA does note page 118 of the DEIS states that the Kalo'i basin will not exceed pre-developmetn conditions while the Honoululi basin willdischarge at rates not exceeding the 10-year occurrence flow rate (for which OHA would request analysis for impacts to the nearshore environment) and that the West Loch basin has no drainage rate.

AR00027446

OHA wishes to point out that there are a host of State water quality standards that must be met by this project.[7] For example, all Hawai'i state waters are classified as Class A or Class AA. Class A waters have strict pollution discharge regulations to protect them for recreational and aesthetic enjoyment. This includes the Clean Water Branch requirements that any project and its potential impacts to State waters meet the following criteria:

> -Anti-degradation policy (Hawai'i Administrative Rules (HAR), Section 11-54-1.1), which requires that the existing uses and the level of water quality necessary to protect the existing uses of the receiving State water be maintained and protected.
>
> -Designated uses (HAR, Section 11-54-3), as determined by the classification of the receiving State waters.
>
> -Water quality criteria (HAR, Sections 11-54-4 through 11-54-8).

OHA further notes that the Kalo'i Gulch drainage way (as do the Honouliuli and West Loch drainage basins which are potentially to be used for this project) eventually discharges into the ocean. As such, OHA inquires as to the monitoring plan proposed by the applicant to ensure that the Rules Relating to Storm Drainage Standards and discharges into State waters are being complied with.

OHA also sees that the DEIS on page 33 states, "Proposed drainage improvements within the Petition Area include on-site detention and retention basins, which will promote on-site infiltration of surface water and facilitate groundwater recharge." OHA points out that this is in contradiction to the statement made on the previous page of the DEIS (page 32) which indicates that surface water is not tied to groundwater: "Within the Petition Area, surface water in the channel (Honouliuli) does not appear to be connected to the groundwater."

OHA urges the applicant to be aware of the potential for water in the detention and retention ponds to seep into the groundwater system. As such, we ask if an overfill pipe will be included in these ponds and what are the impacts from the expected overflow. Further, we ask that the applicant provide analysis as to the effects of the increased discharges from their proposed use of the Petition Area drainage basins on the nearshore environment. In particular we are concerned about the effects from this project on fishing grounds, limu and fishponds, all of which are found in the area and all of which

[7] This is because the proposed project is seen as exempt due to its not being significantly different from the original fill design. See 33 Code of Federal Regulations 323.4(a)(2).

are being currently used by our beneficiaries for their constitutionally protected cultural practices. We note that the Cultural Impact Assessment states on page 98 that there are such practices in the Project Area but that:

> The Project Area is approximately 600m (2,000 feet) back from the coast therefore marine resources will not be affected.

OHA disagrees with this statement and seeks clarification as to what the basis was for this particular determination. Analysis for this type of conclusion in an environmental review document should be accompanied by such things as instream flow rates, biological assessments and brackish water content for the area. This is particularly important because we see that our beneficiaries' interests will be negatively impacted by this action in this regard.

Also, regarding the makai detention basin, OHA notes that permission of the Navy would be required for this basin to be built and not only has the Navy not given its permission, they have refused and, despite what may have been in the past, there is no indication that OHA is aware of that they may acquiesce to the applicants request. Naturally, this raises a host of concerns for all involved, no doubt mostly to the applicant.[8] However, OHA does wish to see analysis provided in an environmental review for all aspects of a proposed project that are truly feasible at the time of writing the document. Future possibilities and conditionals cannot provide the basis for substantive review and meaningful public input.

To help mitigate the adverse impacts of a proposed project and make it the best it can be OHA urges that the applicant provide information and analysis for parts of the project that are likely to come to fruition.[9] We point this out because we also see that this project hinges upon not only Navy permission that is not forthcoming, but also a proposed building out of a wastewater treatment plant and associated improvements[10], the "assumption"[11] for a proposed transportation system servicing the area, and recycling programs that do not exist yet.

Regarding stormwater in general, OHA wishes to see stormwater as a resource to be captured and conserved rather than a nuisance to be channeled and drained away. As stormwater travels down a drainage system, it accumulates industrial waste, pesticides,

[8] OHA notes that if Navy land is used, a Section 106 of the National Historic Preservation Act consultation and other federal assessments may be triggered.
[9] DEIS, page 91.
[10] DEIS, page 31.
[11] "The Ho'opili project has been planned assuming that certain planned transportation projects will be constructed...." DEIS, page ix.

AR00027447

oils, and chemicals. These pollutants quickly settle into the nearshore sediments and are re-suspended into the water column when disturbed.

Persistent organic pollutants (POPs) are organic compounds that linger in the environment, travel through the food web, and pose risks to human health and the environment. Organic hydrocarbons, including petroleum products, are examples of POPs. POPs are most commonly introduced to marine systems via discharged sewage and stormwater effluent, terrestrial runoff, and oil spills. POPs can also bioaccumulate in the nearshore species that inhabit these areas.

Therefore, OHA recommends the use of a stormwater management system that would filter these and other pollutants out and slow the amount of sediments entering our waters. The following four water management methods and erosion control structures are used by the Food and Agriculture Organization of the United Nations[12]:

- runoff harvesting (catching runoff for supplementary irrigation);
- total absorption or infiltration;
- runoff diversion (redirecting excess water);
- runoff spreading (distribution of runoff energy).

OHA is pleased to see that the applicant is proposing to use retention and detention ponds where possible. OHA does remark that if ponds are used, they should be shallow with slow sloping bottoms. The slow sloping sides are needed for safety if people happen to fall in. A surrounding area around the pond should be provided for water storage when heavy rains are present. OHA does ask if retention and detention ponds will be installed near each other in a row so that the water will get held up in the detention pond and slowly drain into the retention pond. The detention pond will help eliminate flooding and the retention will hold the remaining water. The use of permeable paving materials can also retain some of the rain that falls and catch basins can capture and help to slow the runoff thereby reducing turbidity and sediment runoff.

Retention and detention ponds also serve to remove pollutants, such as POPs and trash. Since retention and detention ponds are the drainage basin for an area, pollutants, trash and debris are washed into these areas often after heavy rains or wind rather than entering the nearshore environment. Retention and detention ponds can help to capture many types of pollutants. Also, OHA recommends allowing native and drought resistant "thick" vegetation or "buffer strips" to grow where possible to filter and slow runoff and

[12] See http://www.fao.org/docrep/T1765E/t1765e0n.htm.

soak up pollutants. Trees, shrubs, and groundcover absorb up to fourteen times more rainwater than a grass lawn and they don't require fertilizer.[13]

OHA also suggests that any drainage channels be altered from their smooth bottoms with the addition of berms, blocks, or recessed 'checkerboards' to further reduce the introduction of sediments and turbidity into the nearshore environment.

OHA appreciates the applicant's intent to reduce inflow and infiltration via manholes, which should result in increased capacity in the existing system and hopefully reduce peak flows, thereby mitigating the need for wet-weather storage facilities.

As you know, inflow of storm runoff through manhole covers, particularly in areas that are inundated due to poor drainage, can be significant. In addition to the applicant's already mentioned procedures for manholes, OHA also suggests that the applicant consider that substantial inflow could potentially enter manholes below the frame due to misalignment, damaged mortar or cone, or other problems. In some cases, rain induced infiltration may also enter through the manhole cone if the surrounding material is highly permeable and the cone exhibits porous brick mortar joints.

Section 1-4.2 (4) (a)(3) of the *Rules Relating to Storm Drainage Standards* states that the bottoms of manholes shall be shaped to channelize flow and sloped with the slope of the pipe.[14] OHA asks if the Stormceptor type storm drain manholes will accomplish these goals.

OHA was surprised that this DEIS did not contain information regarding Best Management Practices (BMPs). The cost of improperly maintained BMPs can be devastating to a business and community. Improperly maintained BMPs not only decrease in efficiency of removing pollutants, they also create environmental hazards (such as flooding and contamination), placing an owner or property manager at risk for liability.

Structural best management practices seem to be most effective when they can be combined in a treatment train. "Treatment train" refers to the application of a series of physical stormwater best management practices to achieve improved drainage water quality. However, BMPs will fail if improperly located within the treatment train or not properly maintained.

[13] See Maryland's Stormwater Management Program at:
http://www.mde.state.md.us/Programs/WaterPrograms/SedimentandStormwater/index.asp
[14] See http://www.cleanwaterhonolulu.com/storm/notices/swmp/app-e1.pdf.

AR00027448

Once implemented, however, BMPs require monitoring to ensure that they are achieving the objectives for which they were selected. BMP monitoring also involves scheduling of inspections to ensure that the outcomes of BMPs meet expectations. At the heart of BMP effectiveness monitoring is a listing of each BMP, its expected performance and an assessment of whether the controlled value (noise, dust, water quality, etc.) is within targeted limits.

OHA, therefore, inquires as to the applicant's BMP plan (including monitoring and effectiveness) which should be prepared and implemented to minimize the impacts on water quality. Long term operational impacts such as increased pollutant loads in storm discharges should similarly be included in the plan and treated to the best degree possible prior to discharge in order to conform with Hawai'i Administrative Rules §11-54-03(c)(2)(A)(i) and (iii).

Regarding soil erosion, the erosion control standards and guidelines state that large projects like this one (Categories 4 and 5) must utilize the Universal Soil Loss Equation to evaluate and compare existing conditions with relative soil loss rates caused by construction and post-construction activities not exceeding the maximum allowable soil loss rates for Oahu. (see www.cleanwaterhonolulu.com/storm/notices/swmp/app-c2.pdf and also Rules Relating to Storm Drainage Standards at www.cleanwaterhonolulu.com/storm/notices/swmp/app-c1.pdf) OHA inquires as to the nature of the soil erosion rates and subsequent discharge that the applicant calculates will occur as a result of this proposed project.

To mitigate these negative effects, OHA recommends cleaning job-site construction equipment and establishing groundcover as quickly as possible after grading with native or endemic drought tolerant species. In addition to landscaping and watering programs, other mitigation measures suggested include:

- Early construction of drainage control features;
- Construction of temporary sediment basins to trap silt, where needed;
- Use of temporary berms and cut-off ditches where needed; and
- Use of temporary silt fences (coir works well) or straw bales to trap silt.

Use of sediment pouches placed at drainage catch basins to capture silt and sediment before the surface flow enters the drainage system or coir erosion and sediment control products is recommended. Water from dewatering should be treated in a settling tank and disposed of in the wastewater collection system and under no circumstances should it be allowed to enter the subsurface drainage system or nearby waterways.

OHA was also pleased to read on page xi of the DIES that the applicant intends to reduce, reuse and recycle materials and promote the "optimal use of solid wastes through programs of waste prevention, energy resource recovery, and recycling." However, other than tying into the city's proposed recycling plan and possibly using photovoltaics, we did not read much detail regarding these types of plans and OHA would be very interested in learning more about them and how specifically these goals will be accomplished.[15]

OHA would also like to point out that the applicant should consider that by 2020, 20% of Hawai'i's electricity is to be from renewable sources.[16] Further, the Energy Advisory Committee's first of three major concerns for Hawai'i listed in their 2005 Functional Plan is the State's over dependency on oil and fossil fuels. The committee also lists these two objectives:

> A) To moderate the growth in energy demand through conservation and energy efficiency.
>
> B) Displace oil and fossil fuels through alternate and renewable energy resources.

As such, OHA recommends the use of not only photovoltaic cells but also small wind harvesting electrical generation for peripheral uses such as parking lot lighting. Solar energy should also be incorporated into the building plans. During construction, OHA urges the use of recyclable materials: steel studs and structural members, and wood products from certified sustainable sources.

OHA also recommends using the Leadership in Energy and Environmental Design (LEED) Green Building Rating System. This is the nationally accepted benchmark for the design, construction, and operation of high performance green buildings. LEED promotes a whole-building approach to sustainability by recognizing performance in five key areas of human and environmental health: sustainable site development, water savings, energy efficiency, materials selection, and indoor environmental quality. Surface runoff generated by the facility should be stored or re-used for on site needs as part of a design concept attempting to reduce or eliminate any demands on the municipal storm drainage system. These are the types of things that OHA would like to see of a

[15] Pages 14 and 22 of the DEIS had provided no details regarding the proposed sustainable 'green' community either.

[16] See Act 95, Session Laws of Hawai'i which, in 2004 set that new original renewable portfolio standard goal.

AR00027449

project that seeks to "incorporate green building practices to be an environmentally-sound, healthy and resource-efficient community."[17]

OHA would like to suggest that the project area be landscaped with the type of groundcover that is comprised of drought tolerant native or indigenous species. Any invasive or aggressive non-native species should also be removed. Doing so would not only serve as practical water-saving landscaping practices and pollution filters, but also serve to further the traditional Hawaiian concept of mālama 'āina and create a more Hawaiian sense of place.

Further, OHA also notes that the biological assessment regarding flora as presented in the DEIS on page 36 is not complete:

> Due to access issues that prevented the botanical consultants from surveying the detention parcel that terminates in Pearl Harbor (Parcel D2), the property was observed from a nearby footpath and appears to be dominated by kiawe. (emphasis added)

OHA recognizes that this is the applicant's proposal and, therefore, the applicant's responsibility to fulfill the requirements of an environmental assessment. If access to the property is an issue, (which clearly it is- the Navy has not given permission for the applicant to use this parcel) then the applicant should present an alternative along with the appropriate analysis for that alternative. Under no circumstances should a lack of access or information be used (much less presented in a DEIS) by an applicant as an excuse in an environmental review document. This frustrates the very purpose of the environmental review process which is to provide the public with information regarding all aspects of a proposed undertaking so that informed comments can be given and harmful effects mitigated. In short, OHA cannot perform our constitutional mandate to assess a proposed project for its potential impacts to our beneficiaries nor are we able to make this the best project it can be due to a lack of information.

OHA is relieved by the assurances given in the DEIS that should iwi kūpuna or Native Hawaiian cultural or traditional deposits be found during ground disturbance, work will cease, and the appropriate agencies will be contacted pursuant to applicable law. However, we are concerned about the details of the preservation plan and archaeological monitoring plan that is being prepared for such a large area with the potential for cultural deposits to be unearthed.

[17] DEIS, page vii.

OHA apologizes for the timing of this review and we understand that your acceptance of these comments is discretionary. We do thank you for your understanding and time. If you have any further questions or concerns, please contact Grant Arnold at (808) 594-0263 or grantn@oha.org.

Sincerely,

Clyde W. Nāmu'o

Attn: Mr. Grant Arnold

SUBJECT: HO'OPILI DRAFT ENVIRONMENTAL IMPACT STATEMENT

Dear Mr. Nāmu'o:

Thank you for your letter dated April 17, 2008 (OHA's reference number HRD08/2945B) which was dated nine days after the end of the public review period set pursuant to section 11-200-22, Hawaii Administrative Rules ("HAR"). We offer this response to your comments although state law does not require your comments be considered or responded to. By our response, we do not intend to waive or relinquish any rights that we have or may have under law, including the right to object to any potential standing that you may claim to have or allegations that you may raise pursuant to Chapter 343, Hawaii Revised Statutes ("HRS") and Title 11, Chapter 200, HAR. We have reviewed your letter and offer the following responses to OHA's comments.

Agriculture

Office of Hawaiian Affairs Comment: "OHA understands, and as the applicant has pointed out, that the City and County of Honolulu is in a housing crisis and our collective population is expected to grow in the foreseeable future. We also understand that the amount of available land for our homes is scarce. Naturally, this puts us all in a bind. However, OHA fundamentally cannot support a project that proposes to remove the best and most highly-protected agricultural lands on this island from current and active production. OHA notes that these lands have been described as the "golden triangle" on O'ahu, and that they have historically been some of the most productive and consistent agricultural lands in our State.

OHA stresses that this land is zoned Agriculture A-1 which requires that the greatest possible protection be given to these lands. (see Hawaii Revised Statutes Section 205) OHA is deeply concerned that this area be used for agricultural uses only. Our concerns are echoed by the myriad of laws and legislation supporting a strong agricultural economic base and retention of those lands primarily in agricultural pursuits in the specific project area. (see Hawaii Revised Statutes, Section 205, O'ahu General Plan and Sustainable Communities Plan; Section 1-115 of the City Subdivision Rules and Regulations; the State Coastal Zone Management Act; and even the city's 'Ewa Development Plan, last updated in 2000, which emphasizes that high-value farmland be preserved for agriculture for 3,000 acres in the general project area.) OHA stresses that only accessory agribusiness activities which meet the above intent are to be permitted in this area.

Hawaii Revised Statutes section 205-2 states that, "In the establishment of agricultural districts the greatest possible protection shall be given to those lands with a high capacity for intensive cultivation". That is exactly the kind of land that this project proposes to use and as such, OHA cannot reasonably see how the removal of 1,553.844 acres of prime agricultural lands currently in use does not run afoul of state and county land use plans, controls and policies.

Further, Hawaii Revised Statutes section 205-41 states;

> *It is declared that the people of Hawaii have a substantial interest in the health and sustainability of agriculture as an industry in the State. There is a compelling state interest in conserving the State's agricultural land resource base and assuring the long-term availability of agricultural lands for agricultural use to achieve the purposes of:*
> *(1) Conserving and protecting agricultural lands;*
> *(2) Promoting diversified agriculture; -*
> *(3) Increasing agricultural self-sufficiency; and*
> *(4) Assuring the availability of agriculturally suitable lands pursuant to article XI, section 3, of the Hawaii state constitution.*

In 1961, the Committee on Lands and Natural Resources remarked that its goal in creating the State Land Use Commission was primarily to "protect productive agricultural lands... through state zoning." The high value assigned to agriculture lands was emphasized again by the 1976 legislature when they assigned Class A and B agricultural lands "additional protection... [against county approval of] agricultural subdivisions."

Further, and as mentioned in Hawaii Revised Statutes section 205-41, even our state constitution emphasizes that:

> *The State shall conserve and protect agricultural lands, promote diversified agriculture, increase agricultural self-sufficiency and assure the availability of*

AR00027451

agriculturally suitable lands. The legislature shall provide standards and criteria to accomplish the foregoing.

Lands identified by the State as important agricultural lands needed to fulfill the purposes above shall not be reclassified by the State or rezoned by its political subdivisions without meeting the standards and criteria established by the legislature and approved by a two-thirds vote of the body responsible for the reclassification or rezoning action.

Additionally, and as the applicant knows, most of the soils in the project area are rated A or B. This is significant because A and B soil classified agriculture lands have additional layers of protection given to them in Hawaii Revised Statutes section 205-4.5 (16)(b) which does not allow a county to approve a subdivision of these lands unless subdivision is made subject to restrictions that keep them in agricultural use."

Response: We acknowledge OHA's comments regarding: Hawai'i Revised Statutes, Section 205; O'ahu General Plan and Sustainable Communities Plan; Section 1-115 of the City Subdivision Rules and Regulations; the State Coastal Zone Management Act; the Land Study Bureau's Detailed Land Classification System; and the 'Ewa Development Plan.

We also acknowledge OHA's comments regarding the government's constitutional duty to protect agricultural lands through state zoning. Although we understand OHA's concern that Class A and B lands are proposed for residential development, the cited classifications, laws and regulations do not prohibit rezoning and reclassification of agricultural lands.

The laws pertaining to reclassification and enumerated in Chapter 205, HRS do not preclude the applicant from requesting reclassification simply because lands can be used for the cultivation of crops. Furthermore, the section of the Constitution cited on Page 3 of OHA's comment letter has not been fully implemented by statute.

Pursuant to Act 183, 2005 Session Laws of Hawai'i, the counties are currently undertaking a process to identify "Important Agricultural Lands" (IALs) within their respective jurisdictions. Once these lands are identified by the counties, Land Use Commission is required before they are officially designated IALs. IALs across the State still have yet to be identified. However, past planning actions by the City and County of Honolulu give indication that they would be hesitant to designate lands within their defined urban growth boundary as IALs.

Ho'opili's proposed action is consistent with the growth policy for 'Ewa. 'Ewa is a key component of the City and County of Honolulu's directed growth policies. In 1974, Donald Wolbrink of Harland Bartholomew developed a visionary plan for Kapolei. After much public discussion, the decision to direct urban growth to the 'Ewa area became the official policy of the City and County of Honolulu. In 1977, the Honolulu City Council approved a new General Plan that designated 'Ewa as the location for a Secondary Urban

Center for O'ahu. The Secondary Urban Center was to be the focus of major economic activity, housing development, and a center for government services, while preserving areas such as Wai'anae and the North Shore for rural uses.

Ho'opili's proposed action follows in the footsteps of various state, City, and private planned and developed projects in the area. DHHL, HHFDC, and UHWO have all developed former agricultural lands immediately adjacent to the proposed Ho'opili project into the Villages of Kapolei, University of Hawai'i – West O'ahu Campus, and the Department of Hawaiian Home Lands East Kapolei development. All these developments also fall within the City-established urban growth boundary. Most of these developments have occurred where the Land Use Commission has approved State Land Use District Boundary amendments from Agriculture to Urban. Also, as OHA is aware, DHHL's position is that it is exempt from State land use laws, County zoning and governmental land use policies, and their decisions have also urbanized hundreds of acres on the 'Ewa Plain.

The State appears to maintain its commitment toward growing the Second City in Kapolei by its construction of State office building, and a planned new judiciary complex on former agricultural lands. It has been reported that OHA itself is seeking 110 acres of land in Kalaeloa that while most recently used for military use, was previously used for sugar cane cultivation.

Alternative Analysis

Office of Hawaiian Affairs Comment: "OHA realizes that housing is an important issue for our beneficiaries and a difficult one for this State. This is why we seek to improve upon environmental review documents such as these so that public input can be considered; impacts mitigated and proposed projects become the best that they can be. This is also why we urge the applicant to provide us with additional alternatives analysis. The heart of an environmental review document is its discussion of alternatives. OHA seeks to find a rigorous and objective analysis of all reasonable alternatives to the proposed action, including a discussion of the "no action" alternative as a base-point to which the proposed action can be compared. This was not done in this case. The Alternatives Analysis section of the Executive Summary is nine lines long and the Alternatives to the Proposed Action section (6.0) of the DEIS is but four pages long. A proposed action of this magnitude dealing with an issue of this importance requires more attention than:

Further study or delay of any proposed development on the property would not be consistent with the Ewa Development Plan or the County's objective of directing growth to 'Ewa. Therefore, various alternatives for the site were rejected

OHA notes that being in a hurry or citing previous studies is not reason to skirt an alternatives analysis. Neither is an arrangement of consistent goals, as there are just as many land use policies and goals (if not more) that the applicant proposes to violate. OHA understands that this issue is a difficult one; however, as this is the applicant's

AR00027452

proposed project we ask them to provide valid alternatives analysis for review and public comment in order to make this a better project and avoid further unnecessary costs."

Response: Based on OHA's comments, Section 6.0 *Alternatives To The Proposed Action* of the EIS will be revised as follows:

In compliance with the provisions of Title 11, Department of Health (DOH), Chapter 200, Environmental Impact Statement Rules, Section 11-200-10(6), the alternatives considered are limited to those that would satisfy the objectives of the proposed mixed-use development, while minimizing the potential for adverse environmental impacts. The feasible alternatives must realistically address the project's economic characteristics while also responding to the surrounding land uses that will be impacted by the project. In conformance with applicable regulations, other possible alternatives have been investigated to identify alternative sites, the appropriate uses for the property, and how they would best be accomplished.

6.1 *"No-Action" Alternative*

The "no-action" alternative would not be consistent with stated governmental policies, which direct future growth to the 'Ewa region. The City and County of Honolulu General Plan states:

> *Encourage development within the secondary urban center at Kapolei and the Ewa and Central Oahu urban-fringe areas to relieve developmental pressures in the remaining urban-fringe and rural areas and to meet housing needs not readily provided in the primary urban center.*

Under this alternative, the site would remain as agricultural land, underutilized in terms of meeting the demand for residential homes (including affordable homes) and accompanying land uses. The potential benefit of this alternative is that while remaining under cultivation, the site would provide open space. Implementation of this alternative will avoid: infrastructure impacts (solid waste, wastewater and additional stormwater runoff generated on site); visual impacts (appearance of the site changing from agricultural fields to a master-planned urban development); the loss of agricultural employment; traffic impacts; and construction-related impacts (such as construction noise, construction equipment exhaust emissions, temporary traffic disruption, fugitive dust and soil erosion). Occasionally, however, continued cultivation, harvesting and plowing of the site will expose soils to the erosional forces of wind and rainfall. The demand for housing could result in the following scenarios or combinations thereof: there would be more pressure to develop in the other districts, including the rural areas and other areas currently used for cultivation; there could be a demand for higher density housing in undeveloped areas of 'Ewa at a density not experienced to date; there would be more "doubling up" (larger number of persons per household, with more than one family under roof); those that are not willing to put up with the previously described scenarios may decide to relocate to the U.S. mainland where housing prices have dropped.

The "no-action" alternative was rejected because it is not consistent with government plans to develop Kapolei as the Second City.

6.2 *Alternative Sites*

There are very few large parcels left on O'ahu that are designated for residential development. The largest amount of developable land that is undeveloped lies in Central O'ahu and on the North Shore. As shown on the Ewa Development Plan, the Petition Area is designated mostly Low and Medium Density Residential. As such, the City and County of Honolulu has long recognized that the Petition Area is best used for residential and other development. Directing growth to 'Ewa and in the "urban-fringe" portions of Central O'ahu reduces the pressure to develop outside of the Urban Growth Boundary of Central O'ahu, and the North Shore, Ko'olau Loa, Ko'olau Poko and Wai'anae districts. This alternative has been rejected because it would be clearly contrary to General Plan policy. The potential benefit of this alternative is that for those that object to further development on the 'Ewa Plain, it might be preferable for development to occur elsewhere on O'ahu, such as in the Primary Urban Center, East Honolulu, Central O'ahu, North Shore, Ko'olau Loa, Ko'olau Poko and Wai'anae districts.

The potential benefit of this alternative is that while remaining under cultivation, the site would provide open space. Implementation of this alternative will avoid: infrastructure impacts (solid waste, wastewater and additional stormwater runoff generated on site); visual impacts (appearance of the site changing from agricultural fields to a master-planned urban development); the loss of agricultural employment; traffic impacts; and construction-related impacts (such as construction noise, construction equipment exhaust emissions, temporary traffic disruption, fugitive dust and soil erosion). Occasionally, however, continued cultivation, harvesting and plowing of the site will expose soils to the erosional forces of wind and rainfall.

6.3 *Alternatives Related to Different Designs or Details of the Proposed Actions Which Would Present Different Environmental Impacts*

Different designs could be applied to the project, and depending on the density and design capacity, would result in different environmental impacts. For example, a higher density project that kept the same residential unit count as proposed (11,750) would reduce the buildable area (a positive benefit) and possibly reduce the quantity of surface runoff (a positive benefit). ~~This~~ Another potential benefit of this alternative is that it would likely be easier to serve by bus and correspondingly increase ridership. However, the residential buildings

AR00027453

would be larger and taller. This alternative would not allow as wide a range of residential products to market and was thus rejected. Implementation of this alternative will not avoid: infrastructure impacts (solid waste, wastewater and additional stormwater runoff generated on site); visual impacts (appearance of the site changing from agricultural fields to a master-planned urban development); the loss of agricultural employment; traffic impacts; and construction-related impacts (such as construction noise, construction equipment exhaust emissions, temporary traffic disruption, fugitive dust and soil erosion).

Another alternative would be to set aside less open space and to spread out the community over a larger land area. Such an alternative is best portrayed by the current Kapolei Long Range Master Plan and Ewa Development Plan Land Use Map designations for the Petition Area. This alternative would reduce the density (to some, a positive benefit) but consume more land, increasing the quantity of surface runoff, and requiring a much larger investment in grading and infrastructure. This alternative would make it difficult for residents to be served by bus, and even more difficult by high-capacity transit. Implementation of this alternative will not avoid: infrastructure impacts (solid waste, wastewater and additional stormwater runoff generated on site); visual impacts (appearance of the site changing from agricultural fields to a master-planned urban development); the loss of agricultural employment; traffic impacts; and construction-related impacts (such as construction noise, construction equipment exhaust emissions, temporary traffic disruption, fugitive dust and soil erosion). This alternative was also rejected.

The demand for safe drinking water and the quantities of wastewater, solid waste, and traffic generated would vary with different designs, depending on the number/quantity of residential units, schools, commercial square footage, and roads.

6.4 ACTIONS OF A SIGNIFICANTLY DIFFERENT NATURE WHICH WOULD PROVIDE SIMILAR BENEFITS WITH DIFFERENT ENVIRONMENTAL IMPACTS

One scenario that would be significantly different from the proposed action is that an elevated rail line and accompanying transit stops would not be built through Ho'opili. Implementation of this alternative will not avoid: infrastructure impacts (solid waste, wastewater and additional stormwater runoff generated on site); visual impacts (appearance of the site changing from agricultural fields to a master-planned urban development); the loss of agricultural employment; traffic impacts (assume greater traffic impacts than without the HHCTC project); and construction-related impacts (such as construction noise, construction equipment exhaust emissions, temporary traffic disruption, fugitive dust and soil erosion). The impacts of this scenario will be better described in the upcoming HHCTC DEIS.

For the 'Ewa district drivers enduring the longest morning commutes to the Central Business District or UH Mānoa, the modes of transportation will continue to be limited to: private motorized vehicle (including zipper lane), TheBus, TheBoat, Vanpool, et cetera. While this is a scenario that could inevitably result in lengthening commute times, individual commuters will either: bear with the commute in return for the comfortable lifestyles offered by their homes in 'Ewa; move from their homes in 'Ewa and move closer to their workplaces or schools; or find schools and/or employment in the 'Ewa region. The opening of UHWO will reduce traffic from those undergraduate students in Leeward and Central O'ahu who commute to UH Mānoa, and indirectly reduce the demand for student housing on the UH Mānoa campus (reducing the demand for off-street parking demand on campus, reducing the demand for on-street parking in the surrounding neighborhoods, increasing the supply of student housing on campus, and reducing the demand for student housing off-campus). If the Petitioner is allowed to develop a mixed-use (residential/commercial/office/light industrial) project as proposed, then, more employment opportunities will be provided to existing residents of the region, reducing the need for some 'Ewa residents to commute outside of the District to work. To offset the non-implementation of the HHCTC project, the City and County of Honolulu may decide to increase The Bus and The Boat services. The positive benefits of this alternative is that the visual impact impacts of an elevated rail system would be avoided as well as long-term commitment of State and Federal funds for the HHCTC project. This alternative is not desirable, but feasible.

6.5 THE ALTERNATIVE OF POSTPONING ACTION PENDING FURTHER STUDY

Development of the 'Ewa region as O'ahu's Second City has been studied and planned for many years. Further study of any proposed development on the property would only be delaying what has long been proposed in the Ewa Development Plan. Therefore, this alternative was rejected, as it would not achieve the overall objectives for the project, which would create a mixed-use community that more employment opportunities will be provided to existing residents of the region, reducing the need for some 'Ewa residents to commute outside of the District to work. The potential benefit of this alternative is that while remaining under cultivation, the site would provide open space. Occasionally, however, continued cultivation of the site would generate dust when portions of the site are harvested and plowed. Implementation of this alternative will temporarily avoid: infrastructure impacts (solid waste, wastewater and additional stormwater runoff generated on site); visual impacts (appearance of the site changing from agricultural fields to a master-planned urban development); the loss of agricultural employment; traffic impacts; and construction-related impacts (such as construction noise, construction equipment exhaust emissions, temporary traffic disruption, fugitive dust and soil erosion).

AR00027454

Occasionally, however, continued cultivation, harvesting and plowing of the site will expose soils to the erosional forces of wind and rainfall.

Affordable Housing

Office of Hawaiian Affairs Comment: "In terms of housing, OHA additionally notes that according to the Center on Budget and Policy Priorities webpage, (http://www.cbpp.org/4- 17-06sfp.htm); as of April 2006, the poverty level for a two-parent family of four in Hawaii is $19,961. As such, we ask how many of the applicant's proposed homes will be made to be affordable and to what standard is affordable defined."

Response: The Center on Budget and Policy Priorities, a Washington, D.C. think-tank, does not set affordable housing policy for the State or City. Affordable housing requirements are typically set and approved by the counties, in this case, by the Honolulu City Council as may be specified in conditions set forth in as zoning conditions requiring the developer to develop affordable housing units. The Petitioner's intent is to comply with all legal requirements concerning affordable housing, including mandatory restrictions on transfer, sale/buyback and use.

Drainage

Office of Hawaiian Affairs Comment: "Regarding drainage, OHA notes that Kalo'i Gulch is proposed to be shared by all of the current users and the University of Hawai'i at West O'ahu, the Department of Hawaiian Homelands, the Kroc Center, Haseko's Ocean Pointe development as well as the applicant. Therefore, we will hold the applicant to their statement made on page 223 of the DEIS that discharge flow rates will not exceed pre-development conditions and that the rules relating to water quality standards will be adhered to."

Response: As noted on page 90 of the Draft EIS:

Approximately 100 acres of the Ho'opili project are within this watershed... With respect to the portion of the project within the Kalo'i drainage basin, the project will be creating on-site detention basins to collect all storm water runoff and discharge the flow at a rate that will not exceed pre-development conditions. The project will also be providing storage and detention to meet the Rules Relating to Storm Drainage Standards with respect to water quality standards. The basin size could be decreased at some time in the future when the terminus of Kalo'i basin is finalized. All developed projects discharging to the Kalo'i basin currently have discharge restrictions and these restrictions will continue until the Kalo'i basin terminus is finalized.

Please note that the portion of the project within the Kalo'i drainage basin represents only approximately 6% of the entire petition area.

Office of Hawaiian Affairs Comment: "However, we do seek clarification on this point because page x of the DEIS states, "Over time the project will result in an increase in wastewater being generated that currently being generated on-site (by agricultural activities)."

Response: "Waste water" is a term usually referred to when the contents of human waste is flushed into toilets and liquid wastes are disposed into their sinks. As there are only a limited number of humans currently employed on the Petition Area by existing lessees, the amount of waste water generated is relatively low. As Ho'opili is developed and occupied, the daytime (and nighttime) population will significantly increase, and most residents and visitors (such as those that live elsewhere but work, play, shop or study in Ho'opili) will either turn on faucets that will cause water to drain into sinks and/or generate human waste that will be flushed into toilets. All of this used water and waste material will be collected and treated at the Honouliuli Wastewater Treatment Facility, and some of it will be treated it for reuse (industrial use or irrigation of landscaping).

Office of Hawaiian Affairs Comment: "OHA is also confused as to whether discharge rates will not exceed pre-development conditions because of the statement on page xi: "The project will increase impervious surfaces such as roadways, roof, paved parking areas, and sidewalks. These surfaces will cause an increase in storm water discharge within the Petition Area."

Response: The statements OHA refers to on pages x and xi refer to different processes: one involving wastewater (human waste), and the other drainage (what happens to rain water when it falls on either underdeveloped or developed lands). To put it very simply, the concern with drainage on property "A" is what damage the rain water (usually more appropriately referred to as "storm water") could present to neighboring property "B" (or properties) which is located at an elevation lower than property "A." Again, simply put, current laws allow no more runoff from property "A" to enter property "B" than occurs before new development. Assuming that development of property "A" increases the amount of rain water to collect, then calculations are made to estimate how much more storm water is going to collect on site than under previous conditions. (Please note that not in all situations will new development necessarily result in surface conditions to collect more storm water). We acknowledge that compared to existing conditions, development of the Petition Area will increase the amount of storm water that will collect on site, but the Petitioner is aware that with the increased storm water, it will not be permitted to allow the increased storm water to leave the site in greater quantities, or more specifically, velocities, than it does now.

Office of Hawaiian Affairs Comment: "OHA wishes to point out that there are a host of State water quality standards that must be met by this project. For example, all Hawai'i state waters are classified as Class A or Class AA. Class A waters have strict pollution discharge regulations to protect them for recreational and aesthetic enjoyment. This

AR00027455

includes the Clean Water Branch requirements that any project and its potential impacts to State waters meet the following criteria:

- Anti-degradation policy (Hawai'i Administrative Rules (HAR), Section 11-54-1.1), which requires that the existing uses and the level of water quality necessary to protect the existing uses of the receiving State water be maintained and protected.

- Designated uses HAR, Section 11-54-3), as determined by the classification of the receiving State waters.

- Water quality criteria (HAR, Sections 11-54-4 through 11-54-8).

OHA further notes that the Kalo'i Gulch drainage way (as do the Honouliuli and West Loch drainage basins which are potentially to be used for this projeet) eventually discharges into the ocean. As such, OHA inquires as to the monitoring plan proposed by the applieant to ensure that the Rules Relating to Storm Drainage Standards and discharges into State waters are being complied with."

Response: The project will comply with all regulations set forth by 33 CFR 323.4. The project's detention/retention facilities have two purposes: to reduce the project's peak flow to predevelopment conditions and to provide water quality detention. As noted on page 92 of the Draft EIS:

> *The project will be providing detention basins to meet City and County of Honolulu Standards for water quality treatment. Structural methods may also be used to meet water quality requirements of the Rules Relating to Storm Drainage Standards. Structural methods include the use of Stormceptor® type storm drain manholes.*

Also, monitoring and compliance verification will occur on two fronts:

1. It is primarily the project's (and its Contractors) responsibility to comply with all BMP (Best Management Practices) conditions to ensure that Rules Related to Storms Water Standards as well as all NPDES (Construction Activities) conditions are met. BMP tools used to ensure compliance are silt fences, stabilized gravel entrances, cut-off swales, detention basins, sediment traps and filter berms to name a few. Contractor standard monitoring requirements typically include photo documentation (pre-construction, post-construction and at every time there is rainfall event that that exceeds 0.5 inches in any 24 hour period results in a discharge) and routine checks of all the utilized BMP features.
2. The City has assigned inspectors that provide regular visits to project job sites to verify the Contract and project are in compliance. The State Department of Health also has enforcement personnel who visit job sites.

Office of Hawaiian Affairs Comment: "OHA also sees that the DEIS on page 33 states, "Proposed drainage improvements within the Petition Area include on-site detention and retention basins, which will promote on- site infiltration of surface water and facilitate groundwater recharge." OHA points out that this is in contradiction to the statement made on the previous page of the DEIS (page 32) which indicates that surface water is not tied to groundwater: "Within the Petition Area, surface water in the channel (Honouliuli) does not appear to be connected to the groundwater."

Response: Please refer to Figure 4.2. The project site encompasses three distinct drainage basins: Kalo'i, West Loch and Honouliuli. Please note that the Makai Detention area and outlet services the drainage from the West Loch Drainage Basin. The statements you mention above are not contradictory because the statement on page 33 discusses the potential for groundwater recharge from on-site detention and retention basins for the West Loch Drainage Basin, and the statement on page 32 refers to the source of water flowing in Honouliuli Stream through the Honouliuli Basin.

Within the same paragraph that OHA cites, it is also stated that: "Honouliuli Stream channel acts as the primary channel for runoff from part of the Petition Area and drainage of the watershed upstream." The portion of the Petition Area within the Honouliuli Stream drainage basin is approximately 635 acres or approximately 10% of the Honouliuli Stream drainage basin mauka of Farrington Highway. Stormwater that collects in Honouliuli Stream drainage basin mauka of the Petition Area, collects and flows into Honouliuli Stream.

Office of Hawaiian Affairs Comment: "OHA urges the applicant to be aware of the potential for water in the detention and retention ponds to seep into the groundwater system. As such, we ask if an overfill pipe will be included in these ponds and what are the impacts from the expected overflow."

Response: The location the project's proposed retention and detention systems are not over the primary drinking water aquifer. It is anticipated that their grass bottoms and ability to enhance percolation will be beneficial to the storm water principles cited in your comments regarding storm water quality and management.

Office of Hawaiian Affairs Comment: "Further, we ask that the applicant provide analysis as to the effects of the increased discharges from their proposed use of the Petition Area drainage basins on the nearshore environment."

Response: The information provided in the Drainage Master Plan (reproduced in its entirety as Appendix O of the Ho'opili Draft EIS Volume II) was intended to act as the analysis related to discharges into the near shore environment. The goal of the Storm Water Quality Section of the City Drainage Standards is to address the long term impact on water quality by establishing controls on timing and rate of discharge. Specific emphasis is placed on controlling timing of release from smaller frequent storms. This the analysis provided in the Drainage Master Plan (Appendix O of the Ho'opili Draft EIS

AR00027456

Volume II). By meeting the timed release requirements of the City Drainage Standards it is correlated that the water quality has been treated to best practicable levels.

Office of Hawaiian Affairs Comment: "In particular we are concerned about the effects from this project on fishing grounds, limu and fishponds, all of which are found in the area and all of which are being currently used by our beneficiaries for their constitutionally protected cultural practices. We note that the Cultural Impact Assessment states on page 98 that there are such practices in the Project Area but that:

> *The Project Area is approximately 600m (2,000 feet) back from the coast therefore marine resources will not be affected.*

OHA disagrees with this statement and seeks clarification as to what the basis was for this particular determination. Analysis for this type of conclusion in an environmental review document should be accompanied by such things as instream flow rates, biological assessments and brackish water content for the area. This is particularly important because we see that our beneficiaries' interests will be negatively impacted by this action in this regard."

Response: We appreciate OHA's concern regarding the above statement. Usually, much of the issue surrounding cultural practice pertains to public access, and therefore the statement should have read:

> *The Project Area is approximately 600m (approximately 2,000 feet) back from the coast. Therefore, access to marine resources will not be affected.*

The above sentence will be added at the end of the third to the last paragraph of Section 4.2 *Cultural Resources* of the Final EIS.

Office of Hawaiian Affairs Comment: "Regarding the makai detention basin, OHA notes that permission of the Navy would be required for this basin to be built and not only has the Navy not given its permission, they have refused and, despite what may have been in the past, there is no indication that OHA is aware of that they may acquiesce to the applicants request. Naturally, this raises a host of concerns for all involved, no doubt mostly to the applicant. However, OHA does wish to see analysis provided in an environmental review for all aspects of a proposed project that are truly feasible at the time of writing the document. Future possibilities and conditionals cannot provide the basis for substantive review and meaningful public input.

To help mitigate the adverse impacts of a proposed project and make it the best it can be OHA urges that the applicant provide information and analysis for parts of the project that are likely to come to fruition. We point this out because we also see that this project hinges upon not only Navy permission that is not forthcoming, but also a proposed building out of a wastewater treatment plant and associated improvements, the "assumption" for a proposed transportation system servicing the area, and recycling programs that do not exist yet."

Response: Negotiations between the Applicant and the Navy regarding the referenced Makai Detention parcels are ongoing. If applicable, the Applicant will comply with all relevant Federal Codes, Regulations and Rules including a Section 106 review. However, please note that the proposed project does not "hinge" upon outlet for the makai detention basin through Navy lands. As noted on page 91 of the Draft EIS, if the outlet is not permitted by the Navy:

> *The alternative drainage solution if the overflow across Navy property cannot be resolved is to construct retention basins on site holding back the total volume of a 100 year- 24 hour storm. These basins would be located on the southern portion of Parcel C.*

Office of Hawaiian Affairs Comment: "Regarding storm water in general, OHA wishes to see storm water as a resource to be captured and conserved rather than a nuisance to be channeled and drained away. As storm water travels down a drainage system, it accumulates industrial waste, pesticides, oils, and chemicals. These pollutants quickly settle into the nearshore sediments and are re-suspended into the water column when disturbed.

Persistent organic pollutants (POPs) are organic compounds that linger in the environment, travel through the food web, and pose risks to human health and the environment. Organic hydrocarbons, including petroleum products, are examples of POPs. POPs are most commonly introduced to marine systems via discharged sewage and stormwater effluent, terrestrial runoff, and oil spills. POPs can also bioaccumulate in the nearshore species that inhabit these areas.

Therefore, OHA recommends the use of a stormwater management system that would filter these and other pollutants out and slow the amount of sediments entering our waters. The following four water management methods and erosion control structures are used by the Food and Agriculture Organization of the United Nations:

- runoff harvesting (catching runoff for supplementary irrigation);
- total absorption or infiltration;
- runoff diversion (redirecting excess water); and
- runoff spreading (distribution of runoff energy)."

Response: The OHA comments on storm water primarily relate to management and use as a resource. The Drainage Master Plan (Appendix O of the Ho'opili Draft EIS Volume II) focuses on the management aspects related to minimizing deterioration of near shore water quality. The management aspects focus on controlled timing as required by current standards. Timed release is especially effective at addressing sediment loads, but also indirectly addresses persistent organic pollutants (POPs) by capture due to attachment to the sediment load.

AR00027457

With respect to use of storm water as a resource, the drainage consultant supports the management methods cited by OHA (from the Food and Drug Organization of the United Nations), and adds that the Drainage Master Plan (Appendix O of the Ho'opili Draft EIS Volume II) partially implements some of the general concepts.

Office of Hawaiian Affairs Comment: "OHA is pleased to see that the applicant is proposing to use retention and detention ponds where possible. OHA does remark that if ponds are used, they should be shallow with slow sloping bottoms. The slow sloping sides are needed for safety if people happen to fall in. A surrounding area around the pond should be provided for water storage when heavy rains are present. OHA does ask if retention and detention ponds will be installed near each other in a row so that the water will get held up in the detention pond and slowly drain into the retention pond. The detention pond will help eliminate flooding and the retention will hold the remaining water. The use of permeable paving materials can also retain some of the rain that falls and catch basins can capture and help to slow the runoff thereby reducing turbidity and sediment runoff.

Retention and detention ponds also serve to remove pollutants, such as POPs and trash. Since retention and detention ponds are the drainage basin for an area, pollutants, trash and debris are washed into these areas often after heavy rains or wind rather than entering the nearshore environment. Retention and detention ponds can help to capture many types of pollutants. Also, OHA recommends allowing native and drought resistant 'thick" vegetation or "buffer strips' to grow where possible to filter and slow runoff and soak up pollutants. Trees, shrubs, and groundcover absorb up to fourteen times more rainwater than a grass lawn and they don't require fertilizer."

Response: The retention/detention basins by definition accomplish partial absorption and spreading. Runoff harvesting is not anticipated to be practicable. This is primarily due to O'ahu's short runoff time of concentration (peak flows occur for very short periods) and sustainability of the runoff source (retention/detention basins are anticipated to be essentially dry for a majority of the year). We will also take into consideration OHA's suggestions regarding vegetation types, and slope angle.

Office of Hawaiian Affairs Comments: "OHA also suggests that any drainage channels be altered from their smooth bottoms with the addition of berms, blocks, or recessed 'checkerboards' to further reduce the introduction of sediments and turbidity into the nearshore environment.

OHA appreciates the applicant's intent to reduce inflow and infiltration via manholes, which should result in increased capacity in the existing system and hopefully reduce peak flows, thereby mitigating the need for wet-weather storage facilities.

As you know, inflow of storm runoff through manhole covers, particularly in areas that are inundated due to poor drainage, can be significant. In addition to the applicant's already mentioned procedures for manholes, OHA also suggests that the applicant

consider that substantial inflow could potentially enter manholes below the frame due to misalignment, damaged mortar or cone, or other problems. In some cases, rain induced infiltration may also enter through the manhole cone if the surrounding material is highly permeable and the cone exhibits porous brick mortar joints.

Section 1-4.2 (4) (a)3) of the Rules Relating to Storm Drainage Standards states that the bottoms of manholes shall be shaped to channelize flow and sloped with the slope of the pipe. OHA asks if the Stormceptor type storm drain manholes will accomplish these goals."

Response: OHA has commented on construction techniques for channel bottoms and manholes. New construction will be guided by County Standards. Where possible and County Standards allow, rough concrete channel bottoms will be used. New construction following proper design should not create poor drainage allowing for inundation through manholes. With respect to *Stormceptor*® manholes, construction is almost identical to a City and County manhole, with a feature added to collect "first flush" oils and sediment from more frequent storm events.

Office of Hawaiian Affairs Comment: "OHA was surprised that this DEIS did not contain information regarding Best Management Practices (BMPs). The cost of improperly maintained BMPs can be devastating to a business and community. Improperly maintained BMPs not only decrease in efficiency of removing pollutants, they also create environmental hazards (such as flooding and contamination), placing an owner or property manager at risk for liability.

Structural best management practices seem to be most effective when they can be combined in a treatment train. "Treatment train" refers to the application of a series of physical stormwater best management practices to achieve improved drainage water quality. However, BMPs will fail if improperly located within the treatment train or not properly maintained.

Once implemented, however, BMPs require monitoring to ensure that they al-e achieving the objectives for which they were selected. B monitoring also involves scheduling of inspections to ensure that the outcomes of BMPs meet expectations. At the heart of BMP effectiveness monitoring is a listing of each B, its expected performance and an assessment of whether the controlled value (noise, dust, water quality, etc.) is within targeted limits.

OHA, therefore, inquires as to the applicant's BMP plan (including monitoring and effectiveness) which should be prepared and implemented to minimize the impacts on water quality. Long term operational impacts such as increased pollutant loads in storm discharges should similarly be included in the plan and treated to the best degree possible prior to discharge in order to conform with Hawai'i Administrative Rules §1 1-54-O3c)(2)(A)(i) and (iii).

AR00027458

Regarding soil erosion, the erosion control standards and guidelines State that large projects like this one (Categories 4 arid 5) must utilize the Universal Soil Loss Equation to evaluate and compare existing conditions with relative soil loss rates caused by construction and post-construction activities not exceeding the maximum allowable soil loss rates for Oahu. (see www.cleanwaterhololulu.comlstoimlnotices/swmp/app-c2.pdf and also Rules Relating to Storm Drainage Standards at www.cleanwaterhonolulu.com/stormlnoticeslswmpfapp-cl.pdf) OHA inquires as to the nature of the soil erosion rates and subsequent discharge that the applicant calculates will occur as a result of this proposed project."

Response: The last paragraph of Section 4.8.4, *Drainage Facilities, Anticipated Impacts and Mitigative Measures* of the Draft EIS will be revised to read as follows:

> *Surface water quality can be impacted through development. Per comments received by the State Department of Health Clean Water Branch, any discharges related to project construction or operation activities shall comply with the applicable State Water Quality Standards as specified in Chapter 11-54, HAR. Further, the DOH Clean Water Branch wrote that the Hawaii Revised Statues, Subsection 342D-50(a), requires that "[n]o person, including any public body, shall discharge any water pollutants into state waters, or cause or allow any water pollutant to enter state waters except in compliance with this chapter, rules adopted pursuant to this Chapter, or a permit or variance issued by the director." The project will need to obtain NPDES permits and Grading Permits (as previously identified in the DEIS). Both required permits have substantial effort identified in their applications specifically addressing BMP issues. The substantive parts of the permitting processes focus on BMP tools and monitoring. Features will include: stabilized gravel entrances, siltation berms, diversion of storm water around work areas, use of detention basins, diversion swales, filter traps at catch basins, calculation of soils losses meeting acceptable levels and monitoring plans. BMP's are an important part of current construction practice. The project will be providing detention basins to meet City and County of Honolulu Standards for water quality treatment. Structural methods may also be used to meet water quality requirements of the Rules Relating to Storm Drainage Standards. Structural methods include the use of Stormceptor® type storm drain manholes.*

Office of Hawaiian Affairs Comment: "To mitigate these negative effects, OHA recommends cleaning job-site construction equipment and establishing groundcover as quickly as possible after grading with native or endemic drought tolerant species. In addition to landscaping and watering programs, other mitigation measures suggested include:

- Early construction of drainage control features;
- Construction of temporary sediment basins to trap silt, where needed;
- Use of temporary berms and cut-off ditches where needed; and
- Use of temporary silt fences (coir works well) or straw bales to trap silt."

Response: We appreciate the information provided. Please note that the first paragraph of Section 3.3, *Soils, Anticipated Impacts and Mitigative Measures* of the Draft EIS will be revised to read as follows:

> *During project construction, there is a potential for soil loss through the generation of dust and water-borne soil erosion as areas are graded. All grading operations will be conducted in accordance with dust and erosion control and other requirements of the City and County of Honolulu Grading Ordinance and all applicable provisions regulating Fugitive Dust set forth under Section 11-60.1-33, HAR regarding. A NPDES permit will also be required prior to construction to address construction-related runoff. Additionally, a watering program will be implemented during construction to minimize soil loss through fugitive dust emission. During the public review period, the Department of Health (DOH) Clean Air Branch (CAB) recommended that a dust control management be prepared. The DOH CAB also provided additional examples of measures that can be implemented during construction:*
>
> - *where possible, for areas involving mixed land uses, buffer zones be established to alleviate potential dust nuisance problems;*
> - *planning the different phases of construction, focusing on minimizing the amount of dust-generating materials and activities, centralizing on-site vehicular traffic routes, and locating potential dust-generating equipment in areas of the least impact;*
> - *providing an adequate water resource and watering program at the site prior to start-up of construction activities;*
> - *landscaping and providing rapid covering of bare areas, including slopes, starting from the initial grading phase;*
> - *minimizing dust from shoulders and access roads;*
> - *providing adequate dust control measures during weekends, after hours, and prior to daily start-up of construction activities; and*
> - *controlling dust from debris being hauled away from the project site.*
>
> *In addition, during the public review period, the Office of Hawaiian Affairs wrote: OHA recommends cleaning job-site construction equipment and establishing groundcover as quickly as possible after grading with native or endemic drought tolerant species. In addition to landscaping and watering programs, other mitigation measures suggested include:*
>
> - *Early construction of drainage control features;*
> - *Construction of temporary sediment basins to trap silt, where needed;*
> - *Use of temporary berms and cut-off ditches where needed; and*
> - *Use of temporary silt fences (coir works well) or straw bales to trap silt.*

Office of Hawaiian Affairs Comment: "Use of sediment pouches placed at drainage catch basins to capture silt and sediment before the surface flow enters the drainage

AR00027459

system or coir erosion and sediment control products is recommended. Water from dewatering should be treated in a settling tank and disposed of in the wastewater collection system and under no circumstances should it be allowed to enter the subsurface drainage system or nearby waterways."

Response: Sediment filters at catch basins were identified as one of the BMP tools included in our earlier response to your BMP comments. Dewatering will be treated in accordance with the allowed criteria in the NPDES Form G permit process. The need for dewatering for the project should be minimal or non-existent.

Recycling

Office of Hawaiian Affairs Comment: "OHA was also pleased to read on page xi of the DEIS that the applicant intends to reduce, reuse and recycle materials and promote the "optimal use of solid wastes through programs of waste prevention, energy resource recovery, and recycling." However, other than tying into the city's proposed recycling plan and possibly using photovoltaics, we did not read much detail regarding these types of plans and OHA would be very interested in learning more about them and how specifically these goals will be accomplished."

Response: In response to your comments, the last five paragraphs of Section 4.8.5 *Solid Waste Disposal Facilities, Anticipated Impacts and Mitigation Measures* will be revised to read as follows:

According to the U.S. Environmental Protection Agency, in 2006, individuals recycled 1.5 pounds of our individual waste generation rate of 4.6 pounds per day, for a net waste generation amount of 3.1 pounds per day. Assuming an average household size of 3.0 persons, at full build-out, the solid waste generated by the project is estimated to average approximately 109,275 pounds per day. According to the City and County of Honolulu, approximately 15 percent of residential solid waste is recyclable newspaper, aluminum, glass, and plastic; and 25 to 30 percent is compostable yard trimming. In the future, the H-POWER plant will need to be expanded or an increased emphasis will need to be placed on recycling to dispose of the solid waste.

Recycling will be encouraged within the project including the reuse and recycling of green waste generated during construction clearing and grubbing activities, the use of recycled construction and demolition wastes and the use of materials made from recycled products, the use of locally produced compost as available for landscaping, and the provision of space for recycling bins in the detailed design of the community. As such, a construction waste recycling plan will be prepared before the start of construction.

The City and County of Honolulu is restarting its curbside pick up recycling program. In November, 2007, two pilot curbside recycling programs began in Mililani and Hawai'i Kai. During the six to twelve month evaluation period, the

City and County of Honolulu Department of Environmental Services staff will be coordinating plans for islandwide expansion.

On June 27, 2008, the Associated Press reported that Mililani and Hawai'i Kai residents have recycled 54 percent of their cans, bottles, newspapers and green waste during the city's six-month curbside recycling pilot project. City Officials with the City and County of Honolulu Department of Environmental Services (DES) are reportedly satisfied with the results and are moving forward with plans to provide some 160,000 O'ahu homes the curbside recycling service by May 2010. In the new plan, the city will collect garbage and recyclables each once a week. The DES will no longer have garbage pickup twice-weekly. A study released by DES predicts the program will divert an estimated 53,800 tons of mixed recyclables and green waste from O'ahu landfills. They plan to begin expanding the program to more communities in November 2008.

The goal for waste management is to appropriately reduce, reuse and recycle materials, to minimize generation of solid waste and achieve diversion from landfills. As such, in conformance with Chapter 344-4(2), HRS, the project will promote the optimal use of solid wastes through programs of waste prevention, energy resource recovery, and recycling.

Resources

Office of Hawaiian Affairs Comment: "OHA would also like to point out that the applicant should consider that by 2020, 20% of Hawai'i's electricity is to be from renewable sources. Further, the Energy Advisory Committee's first of three major concerns for Hawai'i listed in their 2005 Functional Plan is the State's over dependency on oil and fossil fuels. The committee also lists these two objectives:

A) To moderate the growth in energy demand through conservation and energy efficiency.
B) Displace oil and fossil fuels through alternate and renewable energy resources.

As such, OHA recommends the use of not only photovoltaic cells but also small wind harvesting electrical generation for peripheral uses such as parking lot lighting."

Response: The Applicant will make efforts to support the State's mandate enumerated in Act 95, 2004 Session Laws of Hawai'i for electricity-generating public utilities to produce 20% of their energy through renewable uses by the year 2020.

We also thank OHA for the recommendation regarding small wind harvesting electrical generation. Section 2.8, *Sustainable Building Design* of the EIS will be revised to read as follows:

Sustainability options are being considered for the Ho'opili project. Where feasible, project buildings, activities, and site grounds are intended to be designed

AR00027460

with energy-saving considerations. Given the natural climate, the project may be suited for the use of renewable energy technologies including photovoltaics. During the public review period, the Office of Hawaiian Affairs wrote: "...OHA recommends the use of not only photovoltaic cells but also small wind harvesting electrical generation for peripheral uses such as parking lot lighting."

According to the American Wind Energy Association, small wind energy systems typically range from $3,000 to $5,000 for every kW (kilowatt) of generating capacity, or about $40,000 for a 10 kW system (installed). According to the Hawaiian Electric Company (HECO), wind generation energy resources typically cost approximately $.08 to $.11/kW per hour, however these rates apply to larger wind systems (wind farms) as opposed to individual wind systems whose rates are not readily available by HECO.

Photovoltaic (PV) systems range in price from $8,250 for a one-kW system to more than $40,000 for a five-kW system. According to HECO, internal estimates for photovoltaic (PV) energy resources typically cost approximately $.30 to $.40/kW per hour.

The average energy consumption by a single-family residence in Hawai'i is approximately 600 kW per hour. According to HECO, "Non-firm sources, such as wind and solar, are called "as-available" resources and must be backed up by firm generation to ensure electricity is available when customers need it -- 24 hours a day, regardless of whether the wind is blowing or the sun is shining."

"In addition to not being available 24-hours-a-day, the variability of wind, typical of the trade winds in Hawaii, can cause power problems. It can affect the quality of power produced. Today, a lot of sensitive electronic equipment can be damaged or disrupted by the variability of power produced from sources like the wind. These fluctuations can also place a big strain on the utility's fossil fuel generators if they have to kick in and meet the demand for electricity when the wind power is suddenly not available."

Even when "as-available" resources are available, HECO still needs to cut back on "as-available" renewable energy sources during off-peak periods of electricity use. This is due to scenarios where customer demand for power drops too low, generation must be turned off to cut back on power production. Otherwise, the electric system could potentially overload and become unstable. Furthermore, fossil-fuel generation can only be reduced so much. This on-and-off cycling could lead to damage and accelerated deterioration of fossil-fuel generators. It also causes the generators to burn more fuel than necessary which leads to an increased cost of electricity.

In June 2008, Governor Lingle signed SB 644 which requires that solar water heaters be required before issuance of a building permit on or after January 2010 for single-family residences.

In addition, based on the Department of Business, Economic Development & Tourism (DBEDT), Strategic Industries Division's recommendations, Ho'opili's mechanical and electrical consultants, in consultation with its sustainability consultant, will be directed to review the City and County of Honolulu's Energy Code early in the project and to consult with Hawaiian Electric Company, Inc. (HECO) on demand-side management programs that offer rebates for installation of energy-efficient technologies.

Office of Hawaiian Affairs Comment: "Solar energy should also be incorporated into the building plans."

Response: In regards to incorporating solar energy into building plans, please note that on page 95 of the Draft EIS it was stated:

The Petitioner is also considering the potential use of photovoltaic cells on future project buildings, where practicable. As an example, large national retailers are entering agreements with micro utility companies who arrange for solar power systems financing and sells such systems to the micro utility company's financing partner. In addition, these micro utilities design, install and maintain these photovoltaic systems per each customer's requirements. The customer pays the financing partner for the solar electricity generated over a long-term power purchase agreement. At the end of the term specified under the agreement, the customer typically has the option to renew the agreement, transfer the equipment to a new site, or purchase the system outright from the financing partner.

Senate Bill 644, SD3, HD3, CD1 was recently passed by the Legislature this session, and proposes to require all new homes built after January 1, 2010 to have solar water heating systems. Should this bill become law, the petitioner intends to comply.

Office of Hawaiian Affairs Comment: "During construction, OHA urges the use of recyclable materials: steel studs and structural members, and wood products from certified sustainable sources."

Response: We thank OHA for its suggestions. Please note that pages 92 and 93 of the DEIS stated:

Recycling shall be encouraged within the project including the reuse and recycling of green waste generated during construction clearing and grubbing activities, the use of recycled construction and demolition wastes and the use of materials mode from recycled products, the use of locally produced compost as available for landscaping, and the provision of space for recycling bins in the detailed design of the community. As such, a construction waste recycling plan will be prepared before the start of construction.

AR00027461

LEED

Office of Hawaiian Affairs Comment: "OHA also recommends using the Leadership in Energy and Environmental Design (LEED) Green Building Rating System. This is the nationally accepted benchmark for the design, construction, and operation of high performance green buildings. LEED promotes a whole-building approach to sustainability by recognizing performance in five key areas of human and environmental health: sustainable site development, water savings, energy efficiency, materials selection, and indoor environmental quality. Surface runoff generated by the facility should be stored or re-used for on site needs as part of a design concept attempting to reduce or eliminate any demands on the municipal storm drainage system. These are the types of things that OHA would like to see of a project that seeks to "incorporate green building practices to be an environmentally- sound, healthy and resource-efficient community."

Response: Thank you very much for the information on LEED. Ho'opili is part of the LEED-ND pilot program, and it is in the early stages of working with the U.S. Green Building Council (USGBC) to obtain information required to implement LEED-ND to the extent that it is feasible and practicable.

Landscaping

Office of Hawaiian Affairs Comment: "OHA would like to suggest that the project area be landscaped with the type of groundcover that is comprised of drought tolerant native or indigenous species. Any invasive or aggressive non-native species should also be removed. Doing so would not only serve as practical water-saving landscaping practices and pollution filters, but also serve to further the traditional Hawaiian concept of mālama 'āina and create a more Hawaiian sense of place."

Response: We thank OHA for the suggestion. As noted on page 37 of the Draft EIS:

> *Native and indigenous vegetation will be considered in the selection of plant materials when a landscaping master plan is prepared.*

Flora

Office of Hawaiian Affairs Comment: "Further, OHA also notes that the biological assessment regarding flora as presented in the DEIS on page 36 is not complete:

> *Due to access issues that prevented the botanical consultants from surveying the detention parcel that terminates in Pearl Harbor (Parcel D2), the property was observed from a nearby footpath and appears to be dominated by kiawe. (emphasis added)*

OHA recognizes that this is the applicant's proposal and, therefore, the applicant's responsibility to fulfill the requirements of an environmental assessment. If access to the property is an issue, (which clearly it is - the Navy has not given permission for the applicant to use this parcel) then the applicant should present an alternative along with the appropriate analysis for that alternative. Under no circumstances should a lack of access or information be used (much less presented in a DEIS) by an applicant as an excuse in an environmental review document. This frustrates the very purpose of the environmental review process which is to provide the public with information regarding all aspects of a proposed undertaking so that informed comments can be given and harmful effects mitigated. In short, OHA cannot perform our constitutional mandate to assess a proposed project for its potential impacts to our beneficiaries nor are we able to make this the best project it can be due to a lack of information."

Response: As noted on page 91 of the Draft EIS, if the outlet is not permitted by the Navy:

> *The alternative drainage solution if the overflow across Navy property cannot be resolved is to construct retention basins on site holding back the total volume of a 100 year- 24 hour storm. These basins would be located on the southern portion of Parcel C.*

Since the alternative involves an area that could be surveyed, the existing biological (flora and fauna) conditions and impacts were described on pages 36-37 and 39-40 of the Draft EIS.

Archaeological

Office of Hawaiian Affairs Comment: "OHA is relieved by the assurances given in the DEIS that should iwi kupuna or Native Hawaiian cultural or traditional deposits be found during ground disturbance, work will cease, and the appropriate agencies will be contacted pursuant to applicable law. However, we are concerned about the details of the preservation plan and archaeological monitoring plan that is being prepared for such a large area with the potential for cultural deposits to be unearthed."

Response: Please be assured that the preservation plan and archaeological monitoring plan are being prepared and will be submitted to the State Historic Preservation Division for their review and comment. Please note that construction is not expected to begin until the necessary governmental approvals are granted.

AR00027462

Thank you again for your participation in the Environmental Impact Statement process for this project. Your comment letter and this response will be included in the Final Environmental Impact Statement. If you have any questions regarding this project, please do not hesitate to contact me at 521-5631.

Sincerely,

PBR HAWAII

RE: Testimony in OPPOSITION to Schuler Homes' Ho`opili Project

The Ho`opili project will displace Aloun Farms and several other farmers who have been successfully farming for several years on prime A and B agriculture land previously owned by Campbell Estate. While Schuler has told the media that the farmers will be relocated, when pressed, it does not appear that Schuler has any guarantee of that. Schuler is simply "inquiring" with other land owners about whether Aloun and the other farmers can be relocated. Sadly, Aloun and the other farmers are bound by "gag clauses" in their leases that prevent them from speaking out against this displacement.

Under our current law, the public can voice its opposition before the Land Use Commission (LUC) and the Planning Commission. The Kapolei Neighborhood Board, Life of the Land, and many others have taken a strong stand against Schuler Homes, calling it a "crime" to evict these farmers from prime agricultural land at a time when Hawaii lawmakers have decried the fact that our state imports over 90% of our food.

Further, while 30% of these homes are required to be affordable, the buy back provision is only temporary. So in 10 years, we will be faced with the loss of precious farms on prime agricultural land, which will likely be replaced by high priced or luxury homes owned by the wealthy.

I urge the LUC to exercise its mission to serve as a check and balance to the County. It was unacceptable for the County to include this land in its urban growth boundary. Given the speculative real estate pressures on Hawaii's limited lands, there is no reason to expedite the

The Honorable Maile Shimabukuro
House of Representatives, 45th District
Hawai'i State Capitol, Room 406
415 South Beretania Street
Honolulu, HI 96813

SUBJECT: HO'OPILI DRAFT ENVIRONMENTAL IMPACT STATEMENT

Dear Representative Shimabukuro:

Thank you for your email dated April 8, 2008. We acknowledge your concern that the proposed project would upon full build-out, displace Aloun Farms and several other farmers.

We appreciate your concerns and the concerns of some of your constituents and office staff. However, the 'Ewa Plain has long been identified by State and City and County of Honolulu ("City") planning agencies as accommodating projected long-term population growth on O'ahu. The growth of the "Second City" is the stated policy of the City government with a goal of reducing development pressures in Wai'anae, Central O'ahu, North Shore, Ko'olau Loa and Ko'olau Poko. We offer the following responses to your specific comments:

Representative Shimabukuro's Comment: The Ho'opili project will displace Aloun Farms and several other farmers who have been successfully farming for several years on prime A and B agriculture land previously owned by Campbell Estate. While Schuler has told the media that the farmers will be relocated, when pressed, it does not appear that Schuler has any guarantee of that. Schuler is simply "inquiring" with other land owners about whether Aloun and the other farmers can be relocated. Sadly, Aloun and the other farmers are bound by "gag clauses" in their leases that prevent them from speaking out against this displacement.

Response: The Petitioner remains committed to working on the relocation of its largest tenant, Aloun Farm, Inc., consistent with its statement on Page 30 of the Draft EIS. However, to date, no site has been secured for that purpose.

All tenants signed leases with full written notice that the area would be subject to future urbanization given anticipated growth in the region, and relocation was imminent at some point in the future. In consideration for the tenants' eventual need to relocate, the Petitioner has made efforts to assist them in the short-term by keeping lease costs for the land and water at or below market rates. This consideration is also mentioned on Page 30 of the Draft EIS.

AR00027464

Representative Shimabukuro's Comment: Under our current law, the public can voice its opposition before the Land Use Commission (LUC) and the Planning Commission. The Kapolei Neighborhood Board, Life of the Land, and many others have taken a strong stand against Schuler Homes, calling it a "crime" to evict these farmers from prime agricultural land at a time when Hawaii lawmakers have decried the fact that our state imports over 90% of our food.

Response: We concur with the first sentence in the paragraph immediately above. There will be ample opportunities for the public to voice their opposition or support for the project before the Land Use Commission, Planning Commission and City Council. We are not aware that either the Kapolei Neighborhood Board nor Life of the Land have submitted written comments during the DEIS public review period "...against Schuler Homes, calling it a "crime" to evict these farmers from prime agricultural land at a time when Hawaii lawmakers have decried the fact that our state imports over 90% of our food." We would like to take this opportunity to note that there are a couple of errors in fact:

1) No farmers are being evicted. As noted above, all leases issued and agreed to the existing tenants reflected that the area would be subject to future urbanization, and they would have to relocate. In consideration for the tenants' eventual need to relocate, for the petitioner kept land and water costs at or below market rates.
2) We take issue with your characterization of the situation as being an eviction and a crime. First, we are not evicting the tenants from their agricultural lands but abiding by the term limits set forth in the leases. These are term limits that were negotiated between the farmers and the landowner and agreed to. However, should legal issues arise if the terms of a lease are not being met or are being violated, we have taken appropriate actions to make sure the violations do not continue.
3) Although "...Hawai'i lawmakers have decried the fact that our state imports over 90% of our food[,]" there are various factors that limit the growth of diversified crops in Hawai'i. As the agricultural impact analysis report (Appendix A of the Draft EIS) stated:

> *"A great many crops can be grown in Hawai'i's year-round subtropical climate, and a number of them can be grown profitably in volumes that require a few hundred acres. However, the modest growth in land requirements for diversified crops reflects the fact that few crops can be grown profitably on a large scale. The primary factors that have limited the growth of diversified agriculture in Hawai'i are given below:*
>
> — *Hawai'i's subtropical climate is not well-suited to the commercial production of major crops that grow better in the temperate mainland climates.*
>
> — *For certain crops, special hybrids adapted to Hawai'i's subtropical climate are yet to be developed.*
>
> — *Crop pests are more prevalent and more expensive to control in Hawai'i than they are on the mainland where the cold winters kill many pests.*

> — *Fruit-fly infestations prevent exports of many crops, or require expensive treatment.*
>
> — *Most soils in Hawai'i have low nutrient levels and therefore require high expenditures for fertilizer.*
>
> — *Hawai'i suffers from high farm-labor costs, largely because the agriculture industry must compete against the visitor industry and related industries for its labor.*
>
> — *Compared to many other farm areas that supply U.S. markets, the cost of shipping agricultural supplies and equipment to Hawai'i is high, as is the cost of exporting produce from Hawai'i to mainland markets. High shipping costs are a result of Hawai'i's remote location and to Federal regulations that require use of American-built ships and U.S. crews between U.S. ports.*
>
> — *For a number of crops, consumption volumes in Hawai'i are too small to support large, efficient farms (i.e., the volumes are too small to realize economies of scale).*
>
> — *On-going trends towards food suppliers purchasing produce that is certified as safe and towards buying from a single supplier of many food items favor large farms.*
>
> — *Hawai'i farmers must compete against highly efficient mainland and foreign farms which, in a number of cases, can deliver produce to Hawai'i more cheaply than it can be produced locally. This is due to economies of scale and, in comparison to Hawai'i, low costs for land, labor, supplies, fertilizer, pest control, equipment, etc."*

Representative Shimabukuro's Comment: Further, while 30% of these homes are required to be affordable, the buy back provision is only temporary. So in 10 years, we will be faced with the loss of precious farms on prime agricultural land, which will likely be replaced by high priced or luxury homes owned by the wealthy.

Response: Your statement reflects the requirements set forth by the City and County of Honolulu in its Rules for the Terms of Unilateral Agreements Requiring Affordable Housing. The Petitioner's intent is to comply with all legal requirements concerning affordable housing, including mandatory restrictions on transfer, sale/buyback and use.

It is quite plausible that the market value of the affordable homes offered in Ho'opili could exceed the original purchase price once the mandatory buyback period has expired. However, this potential problem concerns issues related to public policy. Lawmakers at the State or County are better suited to address these concerns rather than the developer.

AR00027465

Representative Shimabukuro's Comment: I urge the LUC to exercise its mission to serve as a check and balance to the County. It was unacceptable for the County to include this land in its urban growth boundary. Given the speculative real estate pressures on Hawaii's limited lands, there is no reason to expedite the conversion of farmland to market priced and luxury housing, particularly in light of Hawaii's food security and homeless crises.

Response: We acknowledge your comments regarding City's plans (Ewa Development Plan). As an elected State official and an individual, you certainly have the right to convey your wishes to concerning departments and agencies of the State that the City's Ewa Development Plan be completely reversed.

Over the years, a number of communities developed in the 'Ewa region, including the 'Ewa Plantation Villages, the 'Ewa Beach community, and Barbers Point Naval Air Station (now known as Kalaeloa). In the 1960's Makakilo City and the James Campbell Industrial Park were started based on an overall master plan for the area prepared by the Estate of James Campbell in the mid-1950's.

'Ewa is a key component of the City and County of Honolulu's directed growth policies. In 1974, Donald Wolbrink of Harland Bartholomew developed a visionary plan for Kapolei. After much public discussion, the decision to direct urban growth to the 'Ewa area became the official policy of the City and County of Honolulu. In 1977, the Honolulu City Council approved a new General Plan that designated 'Ewa as the location for a Secondary Urban Center for O'ahu. The Secondary Urban Center was to be the focus of major economic activity, housing development, and a center for government services, while preserving areas such as Wai'anae and the North Shore for rural uses.

In August 1977, the State Land Use Commission (SLUC) approved the first State Land Use District Boundary Amendment (SLUDBA) in 'Ewa. This SLUDBA permitted the development of West Beach (now referred to as Ko 'Olina). Subsequent to the Ko 'Olina approval, both the State and the City and County of Honolulu filed at least four petitions with the SLUC to amend the State Land Use Districts in 'Ewa from Agricultural to Urban. In all of the petitions, the General Plan designation of 'Ewa as the Secondary Urban Center was cited as proof that "urbanization" of 'Ewa was consistent with the City and County of Honolulu's planning policy. Similarly, when the Honolulu City Council adopted the *Ewa Development Plan* (DP) in 1997, petitioners cited both the General Plan and the Ewa DP for their respective project's consistency with the City and County of Honolulu's directed growth policy.

In nearly all of the State and City and County of Honolulu SLUDBA's, soils were rated at or near the top of agricultural productivity rating systems: "A" or "B" by the Land Study Bureau (LSB), and "Prime" under the agricultural lands of importance to the State of Hawaii (ALISH) system. For example, the largest SLUDBA involved 1,300 acres of land adjoining Ho'opili in SLUC Docket No. A99-728, also referred to as the Housing and Community Development Corporation of Hawaii (HCDCH) East Kapolei. Ninety-seven percent of the soils in HCDCH East Kapolei were rated "A" or "B" by the LSB, and nearly all of the 1,300 acres were rated "Prime" under ALISH. HCDCH East Kapolei is now under or proposed for development by the University of Hawai'i West O'ahu, the Department of Hawaiian Home Lands, the State

Department of Transportation (North-South Road), the proposed Salvation Army Kroc Center, and the State Department of Land and Natural Resources.

Based on the prior actions undertaken by the state government, we believe that your opposition is contrary to recent developments by State entities in and around the 'Ewa plain. HHFDC, UHWO, DHHL and DOT have all developed former agricultural lands immediately adjacent to the proposed Ho'opili project into the Villages of Kapolei, University of Hawai'i - West O'ahu Campus, the Department of Hawaiian Home Lands East Kapolei development and North-South Road. All of these developments also fall within the urban growth boundary.

The State appears to maintain its commitment toward growing the Second City in Kapolei by its construction of State office building, and a planned new judiciary complex on former agricultural lands. Finally, during the public review period, the State Department of Land and Natural Resources (DLNR), Engineering Division wrote: "DLNR currently owns approximately 183 acres of land near and/or adjacent to the Ho'opili project...The DLNR parcels have excellent development potential based on the location of these lands adjacent to or near major arteries (H-1 Freeway, Farrington Highway, North-South Road) and the City's proposed transit line as well as the substantial increase development projects in the area."

Thank you again for your participation in the Environmental Impact Statement process for this project. Your comment letter and this response will be included in the Final Environmental Impact Statement.

If you have any questions regarding this project, please do not hesitate to contact me at 521-5631.

Dear Applicant,

HOOPILI MASTER PLANNED MIXED USE COMMUNITY

COMMENT ON DRAFT ENVIRONMENTAL IMPACT STATEMENT (DEIS)

As a reminder, I provided testimony on April 9, 2007 regarding the pre-conditions of the Hoopili Project as a development scheme that would upon full build-out, exacerbate the traffic congestion conditions plaguing the Ewa Region and the loss of prime agricultural productive lands.

Many constituents have contacted me regarding the Hoopili Project and want to ensure that in the approval process to reclassify approximately 1,553 acres from an Agricultural District to an Urban District, that such reclassification include the following requisites and placed upon the *Applicant*:

- THE LEVEL OF SERVICE ON THE H-1 FREEWAY IS ELEVATED FROM ITS CURRENT LEVEL OF SERVICE "F" TO A LEVEL OF SERVICE "A" OR A NEW EXPRESSWAY LINKING WEST OAHU WITH DOWNTOWN HONOLULU IS AVAILABLE

- THE EAST WEST CONNECTOR ROAD COMPLETED AND OPEN FOR PUBLIC USE PRIOR TO PERMITTING THE ADDITION OF HOUSING DEVELOPMENT TO OCCUR

Respectfully,

Rida Cabanilla

The Honorable Representative Rida Cabanilla
State Capitol, Room 442
Honolulu, Hawai'i 96813

SUBJECT: HO'OPILI DRAFT ENVIRONMENTAL IMPACT STATEMENT

Dear Representative Cabanilla:

Thank you for your letter dated March 12, 2008, wherein you recommend the following conditions from Ho'opili:

- The level of service on the H-1 Freeway is elevated from its current Level of Service "F" to a Level of Service "A" or a new expressway linking West Oahu with Downtown Honolulu is available.

- The East West Connector Road completed and open for public use prior to permitting the addition of housing development to occur.

We investigated your recommendations. Based on the Traffic Impact Analysis Report (TIAR), Ho'opili, Oahu, Hawaii, prepared by Wilbur Smith Associates, dated February 2008 (Appendix L of the Draft Environmental Impact Statement), the above conditions do not appear to be reasonably related to the need created by Ho'opili nor are the degree of the conditions roughly proportional to the impact on traffic caused by Ho'opili. For this reason, the above conditions go too far and rise to the level of unconstitutional takings under the 5th Amendment Takings Clause of the U.S. Constitution. *See, Nollan v. California Coastal Commission*, 485 U.S. 825 (1987) and *Dolan v. City of Tigard*, 512 U.S. 374 (1994).

The Petitioner's TIAR analyzes the anticipated impacts of Ho'opili and proposes measures to mitigate the impacts directly caused by Ho'opili under various scenarios. As required by law, the Petitioner will contribute its proportional share of improvements to state and county transportation facilities that are reasonably related to the need created by Ho'opili, as documented by the TIAR.

Mr. Dean Uchida
D.R Horton – Schuler Division
828 Fort Street Mall
Honolulu, HI 96813

Dear Mr. Uchida:

Draft Environmental Impact Statement
Ho'opili Project
'Ewa, Oahu

D.R. Horton – Schuler Division, proposes the development of Ho'opili, a mixed-use, transit-ready community in the 'Ewa district of Oahu. The petition area is located to the south of H-1 Freeway, north of Mango Tree Road, east of the proposed UH-West Oahu, and west of Old Fort Weaver Road. Ho'opili is envisioned as consisting of residential units of varying densities (approx. 11,750 units), commercial/business areas, industrial areas, schools, public facilities, transit stops, parks, and large amounts of open space. The proposed development requires the reclassification of approximately 1,553 acres from the Agricultural District to the Urban District. Infrastructure improvements to be improved, expanded, or installed in association with this project include drainage systems, access and circulation roads, water and wastewater collection lines, and electrical/communication systems.

This review was conducted with the assistance of Mark Merlin, Botany; Sharon Ching Williams, Center for Smart Growth and Community Design; and Ryan Riddle, Environmental Center.

General Comments

Ho'opili is obviously a well-designed and innovative community - one that offers mitigation measures for many current and projected transportation and housing dilemmas. We are concerned however, about the implications of permanently removing this land from agricultural production. Ho'opili is planned for one of the last remaining arable properties on the island of Oahu – a parcel once described as "the golden triangle" by Oahu Sugar Plantation employees. 1,375 acres or about 88% of the petition area is designated as prime agricultural land with good soil, easy access to clean irrigation water, transportation to the market, and ideal solar

2500 Dole Street, Krauss Annex 19 Honolulu, Hawai'i 96822

An Equal Opportunity/Affirmative Action Institution

radiation. Given rising fuel costs, transportation costs, and current economic conditions, it is easy to envision a future in which the State of Hawai'i may find this land essential for crop cultivation.

The DEIS concluded that development of this parcel would result in a negligible impact on the growth of diversified agriculture to the state as a whole. The report cited that "the limiting factor to the growth of diversified crops will *not* be the land *supply*. Instead, growth will be limited by the *size of the market* for crops that can be grown *profitably* in Hawaii" (Appendix pp. ES-14 – ES-15). We contend that very soon, this may not be the case. The *size of the market* for crops that can be grown *profitably* in Hawaii will likely grow in proportion to the rapidly increasing costs of importing them.

While Ho'opili is planned for a parcel already outlined for development in the 'Ewa Development Plan (EDP), current events appear to necessitate a new assessment of the EDP. We feel that it is prudent to consider the long-term needs of Oahu, and the state as a whole, by protecting Oahu's prime agricultural lands for seen and unforeseen future agricultural use.

Additionally, we would like elaboration on measures that may be implemented to aid the displaced farmers. Some of the farms in the project area have other lands to which they can be moved, but some do not. What will happen to those farms that will lose their land and do not have other places to which they can relocate? Will D.R. Horton attempt to find them other land on which to farm or otherwise compensate them for the loss of land?

In addition to our general comments, we also have several specific comments.

Archaeological and Historical Resources (pp. 41-43)

On page 41 and 42, five historic properties are listed as being within the petition area, however, no map is included. The addition of a map would enable the reader to more clearly envision the distribution of the sites within the petition area.

Operational Noise (pp. 47-48)

The statement on page 47 of the DEIS, "Over the long-term operation of the project, several new noise generating activities (new land uses, additional traffic) which are not currently present; and introduced new residents to ongoing noise generating activities (aircraft noise, future traffic without the project on surrounding roads, transit" is overly long and confusing. This statement should be rewritten to improve readability and comprehension.

AR00027469

April 8, 2008
Page 3

Man-Made Hazards (p. 53)

In the discussion on pesticides, the DEIS states that large areas adjacent to the petition area have been developed for residential use without any apparent ill effects. We wonder, were there no traces of pesticides found, or were pesticides found in adjacent areas simply within acceptable levels?

Thank you for the opportunity to review this Draft EIS.

Sincerely,

Ryan Riddle on behalf of John Cusick

SUBJECT: HO'OPILI DRAFT ENVIRONMENTAL IMPACT STATEMENT

Dear Mr. Cusick:

Thank you for your letter dated April 8, 2008 (your reference number EIS: 777). We thank you for your comments that "Hoopili is obviously a well-designed and innovative community – one that offers mitigation measures for many current and projected transportation and housing dilemmas." We have reviewed your comments and offer the following responses:

General Comments

Environmental Center Comment: "We are concerned however, about the implications of permanently removing this land from agricultural production. Ho'opili is planned for one of the last remaining arable properties on the island of Oahu – a parcel once described as "the golden triangle" by Oahu Sugar Plantation employees. 1,375 acres or about 88% of the petition area is designated as prime agricultural land with good soil, easy access to clean irrigation water, transportation to the market, and ideal solar radiation. Given rising fuel costs, transportation costs, and current economic conditions, it is easy to envision a future in which the State of Hawaii may find this land essential for crop cultivation."

Response: According to the agricultural impact analysis report prepared for the Draft EIS ("Hoopili Impact on Agriculture," Decision Analysts, Inc., February 2008) "...the acreage released from plantation agriculture has far outpaced the demand for land for diversified crops...an estimated 160,000+ acres remain available for diversified crops. Because of the increased availability of agricultural land, a number of landowners report lower per-acre agricultural land rents on Oahu and the Neighbor Islands compared to rents charged before the major contraction in plantation acreage." While we would concur that rising fuel and transportation costs are of concern, it is interesting to note that Mauna Kea Banana Company recently announced it was ending its banana production citing rising fertilizer and energy costs. So the opposite result from what the Environmental Center is anticipating may actually be occurring.

Environmental Center Comment: "The DEIS concluded that development of this parcel would result in a negligible impact on the growth of diversified agriculture to the state as a whole. The report cited that "the limiting factor to the growth of diversified crops will *not* be the land *supply*. Instead, growth will be limited by the *size of the market* for crops that can be grown *profitably* in Hawaii" (Appendix pp. ES-14-ES-15). We contend that very soon, this may not be the case. The *size of the market* for crops can be grown *profitably* in Hawaii will likely grow in proportion to the rapidly increasing costs of importing them."

Response: While we would concur that the demand for diversified agricultural crops will increase over time, there are various factors that limit the growth of diversified crops in Hawaii. As the agricultural impact analysis report (Appendix A of the Draft EIS) stated:

> *"A great many crops can be grown in Hawai'i's year-round subtropical climate, and a number of them can be grown profitably in volumes that require a few hundred acres. However, the modest growth in land requirements for diversified crops reflects the fact that few crops can be grown profitably on a large scale. The primary factors that have limited the growth of diversified agriculture in Hawai'i are given below:*
>
> — *Hawai'i's subtropical climate is not well-suited to the commercial production of major crops that grow better in the temperate mainland climates.*
>
> — *For certain crops, special hybrids adapted to Hawai'i's subtropical climate are yet to be developed.*
>
> — *Crop pests are more prevalent and more expensive to control in Hawai'i than they are on the mainland where the cold winters kill many pests.*
>
> — *Fruit-fly infestations prevent exports of many crops, or require expensive treatment.*
>
> — *Most soils in Hawai'i have low nutrient levels and therefore require high expenditures for fertilizer.*
>
> — *Hawai'i suffers from high farm-labor costs, largely because the agriculture industry must compete against the visitor industry and related industries for its labor.*
>
> — *Compared to many other farm areas that supply U.S. markets, the cost of shipping agricultural supplies and equipment to Hawai'i is high, as is the cost of exporting produce from Hawai'i to mainland markets. High shipping costs are a result of Hawai'i's remote location and to Federal regulations that require use of American-built ships and U.S. crews between U.S. ports.*
>
> — *For a number of crops, consumption volumes in Hawai'i are too small to support large, efficient farms (i.e., the volumes are too small to realize economies of scale).*
>
> — *On-going trends towards food suppliers purchasing produce that is certified as safe and towards buying from a single supplier of many food items favor large farms.*
>
> — *Hawai'i farmers must compete against highly efficient mainland and foreign farms which, in a number of cases, can deliver produce to Hawai'i more cheaply than it can be produced locally. This is due to economies of scale and, in comparison to Hawai'i, low costs for land, labor, supplies, fertilizer, pest control, equipment, etc."*

Environmental Center Comment: "While Ho'opili is planned for a parcel already outlined for development in the 'Ewa Development Plan (EDP), current events appear to necessitate a new assessment of the EDP. We feel that it is prudent to consider the long-term needs of Oahu, and the state as a whole, by protecting Oahu's prime agricultural lands for seen and unforeseen future agricultural use."

Response: The University of Hawai'i Environmental Center's position is contrary to long established land use policies that were meant to focus development away from country and rural areas such as the North Shore, Waianae, et cetera. Further, such a reversal of public policy is contrary to development efforts undertaken by State agencies such as HHFDC, UHWO, and DHHL developed the adjacent prime agricultural lands into the Villages of Kapolei, University of Hawai'i-West O'ahu Campus, and the Department of Hawaiian Home Lands East Kapolei development. The State played and continues to play a significant role in planning and funding for the growth of the Second City in Kapolei (including the State office building and a planned new judiciary complex) on former prime agricultural lands. Major investments in infrastructure and other publicly-funded facilities have contributed to the growth of the Second City. In addition, the City and County of Honolulu is planning on embarking on what may be the largest Capital Improvement Project in the State's history in its Honolulu High-Capacity Transit project which is planned to start in East Kapolei and run through the petition area. As the Environmental Center knows, the transit corridor alignment was selected to serve the greatest number of Honolulu residents and commuters. Finally, during the public review period, the State Department of Land and Natural Resources (DLNR), Engineering Division wrote: "DLNR currently owns approximately 183 acres of land near and/or adjacent to the Ho'opili project... The DLNR parcels have excellent development potential based on the location of these lands adjacent to or near major arteries (H-1 Freeway, Farrington Highway, North-South Road) and

AR00027471

the City's proposed transit line as well as the substantial increase development projects in the area."

Environmental Center Comment: "Additionally, we would like elaboration on measures that may be implemented to aid the displaced farmers. Some of the farms in the project area have other lands to which they can be moved, but some do not. What will happen to those farms that will lose their land and do not have other places to which they can relocate? Will D.R. Horton attempt to find them other land on which to farm or otherwise compensate them for the loss of land?"

Response: As indicated in the Draft EIS, the Petitioner has been working to assist the tenants in finding a suitable site or sites for relocation. However, to date, no site has been secured for that purpose. Given the planned growth in the region, the leases issued to the existing tenants reflected the fact that the area would be subject to urbanization in the future. The tenants all signed the leases with full knowledge of the circumstances. In order to assist them in the short term consideration for the land and water were kept at or below market rates.

Archaeological and Historical Resources

As requested, the EIS will be revised to include a new Figure 4.1 showing the locations of the five historic sites mentioned.

Operational Noise

Thank you very much for noting the missing text. This paragraph (the sixth paragraph of Section 4.3 *Noise*) will be revised in the Final EIS to read as follows:

> *Over the long-term operation of the project, several new noise generating activities (such as new land uses, additional traffic) will be introduced, which are not currently present; and introduced new residents to ongoing noise generating activities (such as aircraft noise, future traffic without the project on surrounding roads, transit).*

Man-Made Hazards

The Petitioner has been coordinating with the State Department of Health (DOH) Hazard Evaluation & Emergency Response Office (HEER). Based on recent correspondence from HEER, the last two paragraphs in Section 4.5 *Man-Made Hazards, Anticipated Impacts and Mitigation Measures* of the EIS will be revised to read as follows:

> *On March 13, 2008, in an interdepartmental memorandum from the DOH Hazard Evaluation & Emergency Response Office (HEER) to the DOH Environmental Planning Office, HEER wrote: "The land under consideration for development of the Ho'opili Project mixed residential/commercial community was formerly used to grow sugar cane. The Draft EIS acknowledges the presence of potential contamination, and investigative work is being coordinated with the HEER Office." The Petitioner is working with DOH on a sampling methodology to determine the presence and levels of certain pesticides. Subsequent actions will be based on the results of the sampling.*
>
> *Based on sampling done on the adjacent DHHL property, no impacts from pesticide use on the former sugar cane cultivation of the Petition Area are anticipated. Since the Ewa Plain was once mostly under sugar cultivation and large areas have subsequently been developed for residential use without any apparent ill effects, it is anticipated that future residents in the Petition Area will not be exposed to unacceptable levels of pesticides from past or present agricultural activities. During the public review period, the HEER recommended that soils be tested for residual pesticide contamination and that the presence of potential hazards be evaluated. The scope of the investigative work is currently being coordinated with the HEER Office to ensure that the study will be carried out in the most efficient and effective manner possible.*

Thank you again for your participation in the Environmental Impact Statement process for this project. Your comment letter and this response will be included in the Final Environmental Impact Statement. If you have any questions regarding this project, please do not hesitate to contact me at 521-5631.

Sincerely,

PBR HAWAII

Vincent R. Shigekuni

UNIVERSITY of HAWAI'I® WEST O'AHU

Office of the Chancellor

April 8, 2008

Vincent Shigekuni, Vice President
PBR HAWAII
ASB Tower, Suite 650
1001 Bishop Street
Honolulu, HI 96813

Dear Mr. Shigekuni:

SUBJECT: Draft Environmental Impact Statement – Ho'opili
'Ewa, O'ahu, Hawai'i, Tax Map Key 9-1-17: 04 (por), 59, and 72; 9-1-18: 01 and 04.

Thank you for your letter dated February 20, 2008 requesting the University to review and comment on the Draft Environmental Impact Statement (DEIS) to reclassify approximately 1,553.844 acres of land in 'Ewa for the proposed Ho'opili development.

As the land owner of the 500 acre site located west of the proposed development, the University supports approval of D.R. Horton's Ho'opili DEIS. UH West O'ahu has long been a supporter of Kapolei as O'ahu's planned second city. Allowing 'Ewa Plain residents the opportunity to live, work, play and study within Kapolei will allow the vision of a second city to become reality.

As the Chancellor of UH West O'ahu, I was invited to be a member of D.R. Horton's community task force that provided recommendations in the planning phase of the Ho'opili development. In addition, UH West O'ahu and D.R. Horton participate in ongoing meetings with the "East Kapolei Developers Group" to coordinate roadways, traffic concerns, infrastructure and to keep everyone abreast of the progress in the area. Through this group, things such as creation of a coordinated master bike plan and road way circulation plan was created.

Ongoing discussion and coordination is needed with regional landowners to address issues such as infrastructure, transit, roadways, etc., and we expect D.R. Horton will continue to work collaboratively with us to ensure success for the region.

Again, we support D.R. Horton's DEIS and look forward to working together with them for many years to come. Should you have any questions, please feel free to contact Mr. Allan Ah San, Project Manager, at 692-0918.

Regards,

Gene I. Awakuni
Chancellor

SUBJECT: **HO'OPILI DRAFT ENVIRONMENTAL IMPACT STATEMENT**

Dear Chancellor Awakuni:

Thank you for your letter dated April 8, 2008. We have reviewed your letter and offer the following responses to your comments.

1. Thank you for your support of the Ho'opili project.

2. The Petitioner acknowledges that ongoing discussion and coordination is needed with regional landowners to address issues such as infrastructure, transit, roadways, etc., and will continue to work collaboratively with the University of Hawai'i – West O'ahu to ensure success for the 'Ewa region.

Thank you again for your participation in the Environmental Impact Statement process for this project. Your comment letter and this response will be included in the Final Environmental Impact Statement. If you have any questions regarding this project, please do not hesitate to contact me at 521-5631.

Subject: Draft Environmental Impact Statement for Proposed Hoopili Development Ewa, Oahu, Hawaii

Dear Mr. Shigekuni:

The U.S. Fish and Wildlife Service has reviewed the draft Environmental Impact Statement (DEIS) for the Hoopili proposed mixed-use community development (proposed project) located in Ewa on the island of Oahu. These comments are provided in accordance with the Endangered Species Act of 1973 (16 U.S.C. 1531 et seq.; 87 Stat. 884), as amended (ESA); and other authorities mandating Federal oversight of natural resources including the Migratory Bird Treaty Act (16 U.S.C. 703 et seq.)(MBTA).

The proposed project will rezone 1,554 acres of land from agriculture district to urban district. The overall goal of the proposed project is to develop 1,600 acres into a mixed-use development with residential, business, and associated infrastructure. The proposal includes development of a Makai settling basin [(D1) TMK 9-1-010:002] with an outlet [(D2) 9-1-010:014 and 015 (por.)], that will drain through U.S. Navy land adjacent to the U.S. Fish and Wildlife Service National Wildlife Refuge [(NWR) (Pearl Harbor NWR – Honouliuli unit)]. The Honouliuli unit was established for the recovery of the federally endangered Hawaiian stilt (*Himantopus mexicanus knudseni*) and it also supports the federally endangered Hawaiian moorhen (*Gallinula chloropus sandvicensis*), Hawaiian coot (*Fulica alai*), and Hawaiian duck (*Anos wyvilliana*) as well as populations of migratory waterfowl and shorebirds protected under the MBTA.

We are concerned the DEIS does not adequately address potential adverse effects to federally protected bird species. The proposed project could act as a nuisance attractant for listed waterbirds specifically as it relates to the settling basin areas D1 and D2. Uncovered, open water attracts migratory and listed waterbirds to areas they would normally avoid. This type of attraction may result in increased predation pressure from non-native predators such as mongoose, rats, feral dogs and cats. There are feral cats and documented cat feeding stations near the Honouliuli unit and the proposed Makai settling basin and outlet. Attraction to the

TAKE PRIDE® IN AMERICA

AR00027474

settling basin could lead to increased waterbird predation resulting in failed nesting attempts and adult bird mortality.

Therefore, we recommend coordination with our office to develop avoidance and minimization measures for the federally listed species that may be attracted to the open water settling basin in the proposed project. The project as currently proposed, with the use of the Makai settling basin and outlet, may require consultation pursuant to section 7 of the ESA. Section 7 requires Federal agencies to insure that any action authorized, funded or carried out by them is not likely to jeopardize the continued existence of listed species or adversely modify or destroy their critical habitat. The Federal nexus may be the U.S. Navy since their land may be involved in the proposed project.

If there is no Federal nexus, then private landowners, corporations, state or local governments, or other non-Federal landowners who wish to conduct activities on their land that might incidentally harm (or "take") wildlife federally listed as endangered or threatened must first obtain an incidental take permit from the U.S. Fish and Wildlife Service. An incidental take permit allows a property owner to conduct otherwise lawful activities in the presence of listed species. A non-Federal entity develops a Habitat Conservation Plan (HCP) in order to apply for an incidental take permit under section 10(a)(1)(B) of the ESA. The HCP integrates the applicant's proposed project or activity with the needs of the species. It describes, among other things, the anticipated effect of a proposed taking on the affected species and how that take will be minimized and mitigated. Such information must be submitted with any incidental take permit application.

We are available to assist you in developing appropriate minimization and avoidance measures for listed waterbirds. If you have questions regarding these comments, please contact Aaron Nadig of my staff (phone: 808-792-9400, fax: 808-792-9581).

Sincerely,

Patrick Leonard

Attn: Mr. Aaron Nadig

SUBJECT: HO'OPILI DRAFT ENVIRONMENTAL IMPACT STATEMENT

Dear Mr. Leonard:

Thank you for your letter dated April 8, 2008 (your reference number 2008-TA-0127). We greatly appreciate the information provided in your letter. Please be assured that the potential outlet to Pearl Harbor is still considered an unresolved issue as the Navy has yet to reply to our proposal.

In response to the Service's comments regarding the potential that the proposed action may result in impacts to listed waterbird species, the last two paragraphs of Section 3.8 *Fauna, Anticipated Impacts and Mitigation Measures* of the EIS will be revised to read as follows:

> *The notable exceptions to the above are the four endangered waterbird species which currently inhabit the National Wildlife Refuge located north of Parcels D1 and D2. These birds may utilize the proposed detention basin if sufficient water collects to allow ponding. There may be periodic disturbance to the waterbird species if temporary construction occurs within the proposed detention basin (to enlarge it) or if an outlet is allowed. As previously noted, the waterbirds breed in the Honouliuli Unit of the National Wildlife Refuge, less than a sixth of a mile (250 meters) north of Parcels D1 and D2. While the proposed detention basin is located near the Refuge, there is no suitable habitat for these waterbirds in Parcels D1 and D2. According to Bills Engineering, the project civil engineer, the proposed makai drainage will rarely contain standing water.*

AR00027475

At the present time there is no federal nexus associated with this project, because it does not appear that the U.S. Navy will permit access or grant an easement for an outlet from the proposed makai drainage retention basin. If and when this component of the proposed development moves forward, the Petitioner will consult with both the U.S. Fish and Wildlife Service and the State of Hawai'i Division of Forestry and Wildlife to ensure that the construction and operation of the detention basin does not result in deleterious impacts to any species currently listed as endangered, threatened or proposed for listing under either federal or State of Hawai'i endangered species statutes.

Otherwise, impacts to the other existing alien mammalian and avian species and their habitats are expected to be minimal. Disturbance and displacement of individual alien species is likely to occur as construction and development infill takes place. The disturbance will be of a temporary nature.

The results of the arthropod survey at the Petition Area (See Appendix R) indicate that there are no special concerns or legal constraints related to invertebrate resources in the Petition Area. No invertebrate species listed as endangered, threatened or that are currently proposed for listing under either federal or State of Hawai'i endangered species statutes are known to exist on the project site.

Thank you again for your participation in the Environmental Impact Statement process for this project. Your comment letter and this response will be included in the Final Environmental Impact Statement. If you have any questions regarding this project, please do not hesitate to contact me at 521-5631.

Sincerely,

Mr. Vincent Shigekuni, Vice President
PBR Hawaii
ASB Tower, Suite 650
1001 Bishop Street
Honolulu, Hawaii 96813

Dear Mr. Shigekuni:

Subject: Your Letter of February 20, 2008 on the Draft Environmental Impact Statement (DEIS) for Ho'opili, TMK: 9-1-17:4,59,72; 9-1-18:1,4; 9-1-10:2,14,15; 9-1-17:4; 9-2-1:4, 5, 6, 7; 9-2-2:2

Thank you for the opportunity to comment on the proposed project.

We have the following comments to offer:

1. A potable and non-potable water master plan of the entire development should be submitted for our review and approval. The master plan should include the water requirements and proposed infrastructure facilities. The master plan should show that the facilities are able to provide water service and fire protection in accordance with our Water System Standards.

2. The developer will be required to install the necessary water system improvements to serve the proposed development. The construction drawings should also be submitted for our review and approval.

3. Board of Water Supply (BWS) Rules and Regulations require the use of non-potable water for the irrigation of large landscaped areas if a suitable supply is available. The developer should look into the feasibility of serving the large landscaped areas within the development with non-potable water. If the use of non-potable water is not feasible or not available, a report of the findings should be submitted before we allow the use of potable water for irrigation of large landscaped areas. The developer should contact our Water Resources Division at 748-5900 for the availability of recycled water and other non-potable water supplies.

AR00027476

4. We recommend the use of drought tolerant/low water use plants and possible xeriscaping principles for all landscaping. We also recommend the installation of an efficient irrigation system, possibly using drip irrigation. The irrigation system should incorporate moisture sensors to avoid the operation of the system in the rain and if the ground has adequate moisture.

5. The developer should also consider rain barrel catchments, water-efficient front-load washer appliances and ultra low-flow toilets.

If you have any questions, please contact Robert Chun at 748-5443.

Very truly yours,

Honolulu, Hawai'i 96843

Attn: Mr. Robert Chun

SUBJECT: HO'OPILI DRAFT ENVIRONMENTAL IMPACT STATEMENT

Dear Mr. Shida:

Thank you for your letter dated March 6, 2008. We have reviewed your letter and offer the following response to your comments.

1. A conceptual water master plan was prepared and reproduced in its entirety in the Draft EIS Volume II as Appendix M. The water master plan included the Project's water requirements and proposed infrastructure facilities. The water master plan indicated that with the construction of the necessary improvements, the facilities are able to provide water service and fire protection in accordance with the Board of Water Supply's (BWS) Water System Standards.

2. We acknowledge that the Petitioner will be required to install the necessary water system improvements to serve the proposed development. As noted on page 86 of the Draft EIS: *"New water system demands will require that the Petitioner provide system upgrades to the transmission and storage components to ensure that the system operates effectively and meets BWS standards."*

   Also, as noted on page 87 of the Draft EIS, construction drawings will be submitted to BWS for its review and approval.

3. We acknowledge that BWS Rules and Regulations require the use of non-potable water for the irrigation of large landscaped areas if a suitable supply is available. A conceptual water master plan that was prepared and reproduced in its entirety in the Draft EIS Volume II as Appendix M assumed dual potable and non-potable water demand and system. As noted on page 87 of the Draft EIS, it is proposed that the project's greenbelts, parks and roadway medians use non-potable water for irrigation, if a suitable supply will be available. Per the BWS comments, the last paragraph in Section 4.8.2, *Water Supply Facilities, Anticipated Impacts and Mitigative Measures* of the Final EIS will be revised to read as follows:

AR00027477

The project will be maximizing the use of non-potable water for irrigation to minimize the impact on the source component of the BWS system. It is proposed that the project's greenbelts, parks and roadway medians use non-potable water for irrigation, if a suitable supply will be available. The BWS Water Resources Division will be contacted regarding the availability of recycled water and other non-potable water supplies. A Conceptual Water Master Plan addressing safe drinking and non-potable water facilities has been prepared and reproduced in its entirety and attached to this EIS as Appendix M ~~will be submitted to~~ for BWS ~~for its~~ review and approval. In addition, construction drawings will be submitted to BWS for its review and approval. During the public review period of the Draft EIS, the DLNR Commission on Water Resource Management requested that "the reuse of storm water and installation of water efficient fixtures be considered" and recommended "the use of xeriscaping and the planting of drought tolerant and salt-tolerant plans to conserve water supplies."

4. Per the BWS comments, the third to the last paragraph in Section 4.8.2, *Water Supply Facilities, Anticipated Impacts and Mitigative Measures* of the Final EIS will be revised to read as follows:

With respect to non-potable water requirements, the project will be maximizing non-drinking usage to minimize the demand on the safe drinking water system. If a suitable supply is made available, Sstreet right of ways of the Ho'opili project will have underground non-drinking distribution systems. It is proposed to upgrade the existing non-drinking source (EP 5 & 6 located within Parcel C) to a BWS dedicable standard to be used as the source for the non-drinking system. It is also proposed to ultimately allow for future dedication of the non-drinking system. It is estimated that the ultimate non-drinking demand for the project will be approximately 2.1 MGD. The Petitioner will consider the use of drought tolerant/low water use plants and the implementation of xeriscaping principles for landscaping within the Ho'opili project to the extent practicable. The installation of an efficient irrigation system, possibly using drip irrigation, will be considered in the design of the project where feasible. Motion sensors to avoid the operation of the system in the rain and if the ground has adequate moisture would be incorporated into the irrigation system, where feasible.

5. Thank you for your comments regarding smart water consumption. The Petitioner will consider the implementation of rain barrel catchments, water-efficient frontload washer appliances and ultra low-flow toilets, as appropriate. Per the BWS comments, the first paragraph in Section 4.8.2, *Water Supply Facilities, Anticipated Impacts and Mitigative Measures* of the Final EIS will be revised to read as follows:

The total average daily source requirement for ultimate build-out is estimated at 3.9 MGD. The future water demand from the proposed project is based on standard civil engineering methodology; it is possible that with the implementation of feasible water conservation appliances, future water demand from the project may be lessened. During the public review period, the BWS wrote: "The developer should also consider rain barrel catchments, water-efficient front- load washer appliances and ultra low-flow toilets." It is intended that source (well supply) would be provided by BWS from existing sources. Although BWS cannot reserve water for future projects, it has indicated that there is water available to meet the estimated water demand for the project (3.9 MGD). Water Facility Charges paid by the Petitioner will be used by the Board to assist in the source replenishment caused by the project's water demands.

Thank you again for your participation in the Environmental Impact Statement process for this project. Your comment letter and this response will be included in the Final Environmental Impact Statement.

If you have any questions regarding this project, please do not hesitate to contact me at 521-5631.

Sincerely,

PBR HAWAII

Dear Mr. Shigekuni:

Subject: Response to Draft Environmental Impact Statement
Ho'opili Project

Thank you for providing us with the opportunity to review and comment on the Ho'opili Draft Environmental Impact Statement (DEIS). Prior to development, we understand that you will coordinate details of the affordable housing program in the Ho'opili project that pertain to regulations and programs of the City and County of Honolulu.

The Department of Community Services appreciates your consideration of these comments, and looks forward to reviewing the final EIS when it becomes available. Questions regarding this matter may be directed to Mr. Randy Wong at 768-7747.

Sincerely,

Deborah Kim Morikawa

Attn: Mr. Randy Wong

SUBJECT: HO'OPILI DRAFT ENVIRONMENTAL IMPACT STATEMENT

Dear Ms. Morikawa:

Thank you for your letter dated March 6, 2008. We have reviewed your letter and offer the following response to your comments.

We concur that the details of the affordable housing program in the Ho'opili project that pertain to the regulations and programs of the City and County of Honolulu (County) will be coordinated with the County prior to development.

The fourth paragraph of Section 4.7.3 *Housing, Anticipated Impacts and Mitigative Measures* of the EIS will be revised as follows.

> *The proposed housing will be in neighborhoods that integrate low- and medium-density or medium- and high-density residential areas. As a result, Ho'opili will cater to a range of income levels. In accordance with the City and County of Honolulu's affordable housing guidelines, up to 30 percent of the total number of units are expected to be developed as affordable housing units. Details of the affordable housing program in the Ho'opili project that pertain to the regulations and programs of the City and County of Honolulu will be coordinated with the County prior to development.*

Thank you again for your participation in the Environmental Impact Statement process for this project. Your comment letter and this response will be included in the Final Environmental Impact Statement.

Dear Mr. Shigekuni:

Subject: Draft Environmental Impact Statement (DEIS), Hoopili

Thank you for the opportunity to review and comment on the DEIS dated February 2008, for the proposed Hoopili development.

Although not identified in the DEIS, it is our understanding that the project bikeways and walkways not located within roadways to be dedicated to the City will be privately-owned and maintained.

Furthermore, the DEIS does not indicate maintenance jurisdiction of the storm drainage detention and retention basins. These basins shall not be maintained by the City and shall be privately-owned and maintained.

Should you have any questions, please call Charles Pignataro of the Division of Road Maintenance, at 768-3697.

Sincerely,

Craig I. Nishimura, P.E.
Director and Chief Engineer

SUBJECT: HO'OPILI DRAFT ENVIRONMENTAL IMPACT STATEMENT

Dear Mr. Nishimura:

Thank you for your letter dated April 7, 2008. We concur that project bikeways and walkways not located within road rights-of-ways dedicated to the government will be privately-owned and maintained. Based on your comments, the third to the last paragraph of Section 4.9.5, *Recreational Facilities* of the EIS will be revised to read:

> *Open space buffers are proposed to be located along the H-1 Freeway and Old Fort Weaver Road. In addition, linear parks and open space will encircle the Ho'opili project with walking/biking paths. "Mini" parks located throughout the project will be within walking distance of most residences. A regional bikeway plan has been developed in cooperation with UHWO, DHHL and HCDA. Figure 4.3: East Kapolei Regional Bikeway Plan shows the approximate alignment of bikeways being proposed by DHHL, UHWO and the Petitioner and how they may connect to bikeways proposed by others (such as HCDA), the bike path shown on the Ewa DP Public Facilities Map, the bikeways shown on the State Bicycle Plan 2003, and park sites proposed by HCDA, DHHL, UHWO and the Petitioner, and possible transit stops (locations being finalized as of this writing). Based on comments received from the City and County of Honolulu Department of Facilities Management during the public review period, project bikeways and walkways not located within road rights-of-ways dedicated to the government will be privately-owned and maintained.*

We also concur that storm drainage detention and retention basins within the project site shall be privately-owned and maintained, unless particular parcels of land are dedicated to or acquired by the government. Based on your comments, the second to the last paragraph of Section 4.8.4, *Drainage Facilities* of the Draft EIS will be revised to read:

> *The project will increase impervious surfaces such as roadways, roofs, paved parking areas, and sidewalks. These surfaces will cause an increase in storm water discharge within the Petition Area. However, detention basins and/or retention basins are being planned and sited to detain and/or retain storm water to ensure that areas downstream of the project are not impacted. Based on comments received from the City and County of Honolulu Department of Facilities Management during the public review period, storm drainage detention and retention basins within the project site shall be privately-owned and maintained, unless particular parcels of land are dedicated to or acquired by the government. During the public review period, the State Office of Planning requested a discussion of low impact development techniques that can be incorporated into the building and site design to improve stormwater management. Table 1.1 of Low Impact Development: A Practitioner's Guide (2006) lists specific Low Impact Development (LID) best management practices (BMP's) and techniques.*

Thank you again for your participation in the Environmental Impact Statement process for this project. Your comment letter and this response will be included in the Final Environmental Impact Statement. If you have any questions regarding this project, please do not hesitate to contact me at 521-5631.

Sincerely,

Dear Mr. Shigekuni:

Subject: Draft Environmental Impact Statement-Hoopili Project

Thank you for the opportunity to review and comment on the Draft Environmental Assessment for D. R. Horton's proposed Hoopili project.

The Department of Parks and Recreation has no comment. As proposed in the draft EIS we look forward to meeting with the developer at an early stage in the development's planning process to develop a conceptual plan for overall park development which is acceptable and appropriate.

Should you have any questions, please contact Mr. John Reid, Planner, at 768-3017.

SUBJECT: HO'OPILI DRAFT ENVIRONMENTAL IMPACT STATEMENT

Dear Mr. Chang:

Thank you for your letter dated March 7, 2008. We acknowledge that the Department of Parks and Recreation has no comments to offer at this time. We thank you for meeting with us on April 22, 2008. We greatly appreciated you sharing your vision for how the region's recreational needs would be met and how the proposed project will play its role in this vision. The Petitioner assures you that it will continue to coordinate with your Department to develop a conceptual plan for overall park development which is acceptable and appropriate.

Thank you again for your participation in the Environmental Impact Statement process for this project. Your comment letter and this response will be included in the Final Environmental Impact Statement. If you have any questions regarding this project, please do not hesitate to contact me at 521-5631.

April 7, 2008

Mr. Vincent Shigekuni, Vice President
PBR Hawaii
ASB Tower, Suite 650
1001 Bishop Street
Honolulu, Hawaii 96813

Dear Mr. Shigekuni:

Subject: Draft Environmental Impact Statement for Ho'opili, Ewa, Oahu,
Tax Map Keys: 9-1-017:004 (portion), 059, and 072; 9-1-018:001 and 004;
9-1-010:002, 014 (portion), and 015 (portion); and 9-2-002:002; and
9-2-001: 004, 005, 006, and 007

We have reviewed the subject Draft Environmental Impact Statement (DEIS) and offer the following comments.

1. Any anticipated increases in surface runoff should be mitigated through the use of retention basins for the three (3) major drainage basins until the Kaloi drainage system is completed, and a drainage easement across Navy land is approved.

2. Table 2.1 of the DEIS indicates that Roberts Hawaii School Bus, Inc. is a current tenant on the project site. This company stores up to 30 school buses and 60 handi-van vehicles. The applicant should include a map, or revise Figure 2.3 to show where this activity is located. A preliminary check of our records indicates that there is no land use approval for this use. Unless documentation is available granting the outdoor storage use, we will assume the use has not been permitted.

3. On Page 74, regarding transportation impacts, a transit reduction factor was applied under Scenario A, but there is no description of the factor or any statements as to how the factor is being applied or how it was determined. There should be a disclosure of the assumptions being used to calculate the transit factor and any other assumptions used throughout the traffic analysis section of the DEIS. At the very least, there should be citations of references to the traffic report appendix.

   The traffic impact analysis does not adequately describe current conditions on the H-1 Freeway and the interchanges at Kunia and Makakilo in which project traffic would feed into. During the AM peak period, motorists on the H-1 Freeway frequently experience accidents and stalled vehicles along the segment of H-1 from Kunia to Aiea. The accident/stalled vehicle events cause traffic to back up to Kapolei, which affect all

eastbound on-ramps to the H-1 and surface streets leading to the H-1 on-ramps during these events. These events have been increasing and occur about 1-2 times per week, sometimes not always backed up to Kapolei, but usually about halfway between Kunia and Kapolei. Since the H-1 between Kunia and Aiea lack shoulder lanes to allow vehicles to pull off the travel lanes, even minor accidents and stalled vehicles create very long delays to motorists. The DEIS does not adequately address these recurring events and the contribution of the project traffic would probably increase the frequency of these events. The Traffic Impact Analysis Report (TIAR) should include measures to address these situations and not just the improvements planned for local roads leading up to the H-1.

The TIAR should better describe current PM peak conditions at the Fort Barrette/ Farrington Highway intersection where traffic conditions cause long queues that affect the Makakilo/Kapolei westbound off-ramp queues, which affects through traffic on the H-1 just east of the Makakilo Interchange. As the Fort Barrette Road/Farrington Highway intersection increases in v/c, the TIAR should describe projected PM peak conditions on the west-bound off ramp and the effect on H-1 through lanes.

Lastly, the FEIS should discuss the timing of major transportation improvements against the project's timeline.

4. The Department of Planning and Permitting (DPP) is currently processing two (2) separate but similar revisions to the Ewa, Central Oahu (CO), and Primary Urban Center (PUC) Public Infrastructure Maps (PIM) regarding the Honolulu High Capacity Transit Corridor Project.

   In February 2008, the Department of Transportation Services (DTS) submitted a proposal to the DPP to revise the Ewa, CO, and PUC PIM by adding symbols for a "Rapid Transit Corridor," "Transit Stations," "Corporation Yard," and "Park and Ride" facilities. The proposed symbols represent the Locally Preferred Alternative (LPA) that was approved by the City Council via Ordinance 07-1. The DTS' proposal was circulated for public review and comment, and is now before the City Council for action as Resolution 08-97, CD1.

   In March 2008, the City Council introduced Resolution 08-69 regarding a revision to the Ewa, CO, and PUC PIM by adding 40 "Transit Station" symbols along the length of the LPA. Resolution 08-69 does not include symbols for the rapid transit corridor, corporation yards, or park and ride facilities. The DPP is currently preparing to circulate the proposal for public review and comment before forwarding a report and draft resolution to the City Council for action.

   In view of these recent developments, we recommend adding a new subsection to Section 5.3 of the FEIS that briefly discusses the role of the PIM process, and how these resolutions may affect the proposed project.

AR00027483

The Proposed Circulation Plan (Figure 2.8) should be amended to reflect the City's proposal in Resolution 08-87, CD1 for the Honolulu High Capacity Transit Corridor Project. Resolution 08-97, CD1 shows PIM symbols for the proposed alignment, transit stations, and corporation yard. Adoption of Resolution 08-97, CD1 is expected on May 7, 2008.

These comments do not constitute our final comments on this project. As it proceeds through the entitlement process, we expect to ask for more information pursuant to zone change and permitting requirements. Should you have any questions, please contact Tim Hata of our staff at 768-8043.

Very truly yours,

Henry Eng, FAICP, Director
Department of Planning and Permitting

SUBJECT: HO'OPILI DRAFT ENVIRONMENTAL IMPACT STATEMENT

Dear Mr. Eng:

Thank you for your letter dated April 7, 2008. We have reviewed your letter and offer the following responses to your comments:

1. Retention basins are proposed to mitigate increased flow into Kalo'i Gulch until the drainage system is completed. The Honouliuli drainage basin will utilize retention basins to match the design capacity of the drainage system. The West Loch drainage basin will treat all discharge for water quality prior to discharge. We concur that a drainage easement will be required for the West Loch system across Navy land or an alternate drainage solution will have to be utilized. The Draft EIS identifies an 100-year 24-hour retention. All drainage basins will need to provide retention/detention for water quality.

2. The Roberts Hawaii School Bus, Inc. is currently on a month-to-month lease that was inherited when the Petitioner purchased the property. The Petitioner has been paying industrial property taxes for the approximately one acre site. Figure 2.3: Current Lessees of the Final EIS will be revised to show the location of the Roberts Hawaii School Bus, Inc.'s bus storage site. Thank you for bringing this matter to our attention. The Petitioner will investigate this matter and take the appropriate action.

3. Responses to Comments are below:

   a. A detailed description of the transit reduction factor along with other reduction factors applied to Scenario A is provided in Chapter 4 Traffic Estimate (page 4-4) of the Ho'opili TIAR.

AR00027484

b. We acknowledge your comment that current traffic during the morning peak period result in on H-1 from Kunia to Aiea result in extensive queuing and backup. When accidents occur, stalled vehicles in traffic lanes do worsen queuing and backup due to the absence of shoulder lanes. However, as this event is an occasional event rather than a daily event, these were not discussed in the TIAR. The State DOT does have plans to take corrective action to alleviate current traffic operations. Currently, there is ongoing discussion to implement contraflow lanes for the PM peak hour between the Waiawa interchange to the Waikele interchange which would help alleviate the traffic congestion as well. Currently, the timeline for the contraflow lane implementation is not known.

c. As part of the Oahu Regional Transportation Plan for 2030, a new interchange is being planned at Kapolei between the Palailai and the Makakilo Interchange. In addition, new eastbound and westbound ramps will be constructed for the Makakilo interchange. The PM peak hour traffic conditions at the Fort Barrette/Farrington Highway intersection should be alleviated by these new planned improvements.

d. As recommended, the timing of major transportation improvements and their reported schedule for implementation will be shown on a map that will be included in the Final EIS as Figure 4.2 ('Ewa Regional Transportation Plan).

4. As recommended, a new subsection to the Final EIS will be created to discuss the role of the Ewa, Central Oahu, and Primary Urban Center (PUC) Public Infrastructure Maps (PIM) process and its affect on the Ho'opili project. A new Section 5.3.5 *Ewa, Central Oahu and Primary Urban Center Public Infrastructure Maps* of the EIS will be added to read as follows:

Based on comments received from the Department of Planning and Permitting (DPP) during the public review period, it should be noted that DPP is currently processing two separate but similar revisions to the Ewa, Central Oahu (CO) and Primary Urban Center (PUC) Public Infrastructure Maps (PIM) regarding the Honolulu High Capacity Transit Corridor Project.

In February 2008, the Department of Transportation Services (DTS) submitted a proposal to the DPP to revise the Ewa, CO and PUC PIMs by adding symbols for a "Rapid Transit Corridor," "Transit Stations," "Corporation Yard," and "Park and Ride" facilities. The proposed symbols represent the Locally Preferred Alternative (LPA) that was approved by the City Council via Ordinance 07-1. The DTS' proposal was circulated for public review and comment, and adoption of Resolution 08-97 occurred on May 7, 2007. Figure 2.8: Proposed Circulation Plan of the Final EIS has been revised to reflect the City's proposal in Resolution 08-97, CD1 for the Honolulu High Capacity Transit Corridor Project.

In March 2008, the City Council introduced Resolution 08-69 regarding a revision to the Ewa, CO and PUC PIM's be adding 40 "Transit Station" symbols along the length of the LPA. Resolution 08-69 does not include symbols for the "Rapid Transit Corridor," "Corporation Yard," and "Park and Ride" facilities. The DPP is currently preparing to circulate the proposal for public review and comment before forwarding a report and draft resolution to the City Council for action.

As of this writing, the City and County of Honolulu (City) has begun work on the Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor (HHCTC) project, with a target publication date in the second or third quarter of 2008. By the time the HHCTC Draft EIS is published, the final alignment of the "Rapid Ttransit Corridor and the locations of: "Transit Stations," "Corporation Yard" (transit maintenance and storage), "Park and Ride" facilities in Ewa will be known. Ho'opili is being designed to be transit-ready, and the land use plan, while subject to change, has been designed to accommodate a high-capacity transit corridor either along Farrington Highway or through the project site, with either one or two transit station locations. The Petitioner acknowledges that sites for a transit maintenance and storage facility and/or a portion of a park and ride facility may be required within the Petition Area.

5. The Petitioner looks forward to continue coordinating with your department as it proceeds through the entitlement process.

Thank you again for your participation in the Environmental Impact Statement process for this project. Your comment letter and this response will be included in the Final Environmental Impact Statement. If you have any questions regarding this project, please do not hesitate to contact me at 521-5631.

Sincerely,

PBR HAWAII

SUBJECT: HO'OPILI DRAFT ENVIRONMENTAL IMPACT STATEMENT

Dear Chief Silva:

Thank you for your letter dated March 12, 2008. We acknowledge that the Honolulu Fire Department (HFD) has no additional comments, other than those provided in a letter dated March 28, 2007 on the Environmental Impact Statement Preparation Notice.

Thank you again for your participation in the Environmental Impact Statement process for this project. Your comment letter and this response will be included in the Final Environmental Impact Statement.

If you have any questions regarding this project, please do not hesitate to contact me at 521-5631.

Sincerely,

PBR HAWAII

Vincent R. Shigekuni
Vice President

Dear Mr. Shigekuni:

This is in response to your letter of February 20, 2008, requesting comments on a Draft Environmental Impact Statement for the Ho`opili project in Ewa.

The Honolulu Police Department (HPD) will need to expand its patrol services as Ho`opili is developed, given that beat 879 (which now has only a few homes) will eventually have another 11,750 units and at least 35,000 new residents. The HPD looks forward to making the best use of the public facility site proposed by the developer as planning progresses.

If there are any questions, please call Major Michael Moses of District 8 at 692-4253 or Mr. Brandon Stone of the Executive Office at 529-3644.

Sincerely,

BOISSE P. CORREA
Chief of Police

SUBJECT: HO'OPILI DRAFT ENVIRONMENTAL IMPACT STATEMENT

Dear Chief Correa:

Thank you for your letter dated March 5, 2008 (your reference number: BS-KP). We acknowledge that the Honolulu Police Department (HPD) will need to expand its patrol services as the project is developed. As such, we look forward to coordinating with the HPD to make the best use of the proposed public facility site as planning progresses.

The first paragraph of Section 4.9.2 *Police Protection, Anticipated Impacts and Mitigation Measures* of the EIS will be revised as follows:

> *The project will increase the population of Kapolei and the demand for police service. According to the Ewa Development Plan, the 'Ewa Villages Substation is planned to service the East 'Ewa region, which includes the Ho'opili project. The service date for this substation has yet to be determined. The Petitioner is proposing a public facility site immediately mauka of Farrington Highway near the western portion of Parcel B for a use such as a police substation, fire station and/or emergency medical service (EMS) site. During the public review period for the EISPN, the HPD wrote that "the project should have no unanticipated impact on the facilities or operations of the Honolulu Police Department." During the public review period for the Draft EIS, the HPD wrote that "the Honolulu Police Department (HPD) will need to expand its patrol services as Ho'opili is developed... the HPD looks forward to making the best use of the public facility site proposed by the developer as planning progresses."*

Thank yon again for your participation in the Environmental Impact Statement process for this project. Your comment letter and this response will be included in the Final Environmental Impact Statement.

If you have any questions regarding this project, please do not hesitate to contact me at 521-5631.

Sincerely,

PBR HAWAII

EIS

April 28, 2008

Mr. Vincent Shigekuni, Vice President
PBR Hawaii & Associates, Inc.
ASB Tower - Suite 650
1001 Bishop Street
Honolulu, HI 96813-3484

Dear Mr. Shigekuni:

Re: Ho'opili

Thank you for the opportunity to comment on the above-referenced project. Hawaiian Electric Company, Inc. (HECO) has no objections at this time. The following comments were received from our Engineering and Construction & Maintenance Departments:

(1) Engineering/Transmission & Distribution (Sherman Uyehara, 543-7536). HECO has existing overhead and underground facilities within the subject property and will require continued access for maintenance purposes.

The existing overhead electrical facilities along Farrington Highway contain 46kV subtransmission lines, and the area behind the Ewa Nui Substation contain 138kV transmission lines. The relocation of a 46kV line may require a determination by the Public Utilities Commission (PUC) that the line should be constructed overhead (versus underground), pursuant to HRS 269-27.6, and may require a PUC public hearing for overhead construction through a residential area, pursuant to HRS 269-27.5. The PUC approval process for overhead relocation could take from nine months to a year, but may take longer depending on the timing, schedule and complexity of the project. HECO will not be able to order materials or start construction until the requisite PUC approvals are received.

Should it become necessary to relocate HECO's facilities, please immediately submit a request in writing and we will work with you so that construction of the project may proceed as smoothly as possible. Please note that there may be costs associated with any relocation work, and that such costs may be borne by the requestor. Because any redesign or relocation of HECO's facilities may cause lengthy delays, upon determination that HECO facilities will need to be relocated, HECO should be notified immediately in order to minimize any delays in or impacts on the project schedule.

During the planning and design phase of the project, please keep in mind that State Law [OSHA 1910.269(k)(2B)] requires that a worker and the longest object he/she may contact cannot come closer than a minimum radial clearance of ten feet when working close to or under any overhead lines rated 50kV and below. For each additional 10kV above 50kV, an additional four inches shall be added to the ten-foot clearance requirement. In addition, a minimum clearance of ten feet must be maintained during excavation around utility poles and/or their anchor systems to prevent weakening or pole support failure. Clearances shall be maintained between HECO's ductlines and all adjacent structures, according to HECO's Standards.

We appreciate your efforts to keep us apprised of the planning process. As the project progresses, please continue to keep us informed. We will be better able to evaluate any effects on our system facilities further along in the project's development. We request that development plans show all affected HECO facilities, and address any conflicts between the proposed plans and HECO's existing facilities. Please forward the pre-final development plans to HECO for review.

(2) Engineering/Telecommunications Section (Dixson Lau, 543-7543). HECO has existing overhead telecommunications facilities along with our electrical facilities within Parcels A, B and C of the proposed project. Please keep us informed in the same manner as requested above by our Transmission & Distribution Division.

(3) Engineering/Transmission Substation Section (Hope Hameda, 543-7216) Currently, there are existing substation facilities within the project area, mainly within Parcel B (TMK 9-2-28: 01). Please also keep us informed as requested by our Transmission & Distribution Division.

(4) Construction & Maintenance (Paul Nakagawa, 543-7062). We will need continued access to our facilities for maintenance purposes, as covered by our existing easement(s). Should relocation of or additional facilities be required, a formal request should be submitted and coordinated through appropriate HECO department(s).

To ensure HECO's continuing input in this project, I suggest dealing directly with the points of contact noted above. Thank you again for the opportunity to comment.

Sincerely,

Kirk S. Tomita

SUBJECT: HO'OPILI DRAFT ENVIRONMENTAL IMPACT STATEMENT

Dear Mr. Tomita:

Thank you for your letter dated April 28, 2008. We acknowledge that the Hawaiian Electric Company, Inc. (HECO) has no objections at this time. We have reviewed your letter and offer the following responses to your comments:

Engineering/Transmission & Distribution

1. We acknowledge that HECO has existing overhead and underground facilities within the subject property and will require continued access for maintenance purposes.

2. According to Bills Engineering, the project civil engineer, all overhead lines may have to be relocated with the exception of the 138kV (kilovolt) lines. The 12kV and 46kV lines that may become subject to relocation would most likely be placed underground. We acknowledge that the potential relocation of 46kV subtransmission lines along Farrington Highway may require a determination by the State of Hawai'i Public Utilities Commission (PUC) that the line be constructed overhead versus underground and may require a PUC public hearing for overhead construction through a residential area pursuant to HRS 269-27.5. Your company is probably aware that the City and County of Honolulu has long had plans to widen and improve Farrington Highway (between the Kapolei Golf Course to Fort Weaver Road), so please be assured that the Petitioner is unlikely to develop residential uses along Farrington Highway until the City and County of Honolulu has finalized their plans for improving Farrington Highway.

3. We acknowledge that the PUC approval process for overhead relocation could take from nine months to a year, but may take longer depending on the timing, schedule and complexity of the project and that HECO will not be able to order materials or start construction until the requisite PUC approvals are received. Should the project's development require the relocation of HECO's facilities, the Petitioner will notify HECO immediately in order to minimize any delays in or impacts on the project schedule. As previously noted, this is likely to occur after the City and County of Honolulu has finalized their plans for improving Farrington Highway.

4. The Petitioner intends to comply with State Law [OSHA 1910.269(k)(2B)] during the planning and design phase of the project. It is also acknowledged that a minimum of clearance of ten feet must be maintained during excavation around utility poles and/or their anchor systems to prevent weakening or pole support failure. Additionally, it is acknowledged that clearances shall be maintained between HECO's ductlines and all adjacent structures, according to HECO's Standards.

5. The Petitioner's civil and electrical engineering consultants will continue to coordinate with HECO's Transmission & Distribution Section as plans progress. As requested, development plans will show all affected HECO facilities, and address any conflicts between the proposed plans and HECO's existing facilities. Pre-final development plans will be forwarded to HECO for review.

Engineering/Telecommunications Section

1. We acknowledge that HECO has existing overhead telecommunication facilities along HECO's electrical facilities within Parcels A, B and C of the proposed project. The Petitioner's civil and electrical engineering consultants will continue to coordinate with HECO's Telecommunications Section as plans progress.

Engineering/Transmission Substation Section

1. We believe that the TMK that HECO cites as being within the Petition Area is incorrect. The parcel identified as TMK: 9-2-28: 01 appears to be located near the intersection of Makakilo Drive and Palahia Drive. We believe the Ewa Nui Substation is identified as TMK: 9-1-18: 06 and is not part of (but surrounded by) a portion of the project site identified as TMK: 9-1-18: 06. The Petitioner's civil and electrical engineering consultants will continue to coordinate with HECO's Transmission Substation Section as plans progress.

Construction & Maintenance

1. As noted earlier in this letter, the Petitioner acknowledges that HECO will need continued access for maintenance purposes. Should the relocation of or additional facilities be required, a formal request will be submitted and coordinated through the appropriate HECO department(s).

AR00027491

Thank you again for your participation in the Environmental Impact Statement process for this project. Your comment letter and this response will be included in the Final Environmental Impact Statement. April 14, 2008

Mr. Vincent R. Shigekuni
Vice President
PBR Hawaii
ASB Tower, Suite 650
1001 Bishop Street
Honolulu, Hawaii 96813

Dear Mr. Shigekuni:

Haseko (Ewa), Inc. (Haseko) offers the following comments on the Ho'opili Draft Environmental Impact Statement (DEIS).

Haseko is the owner and developer of the Ocean Pointe and Hoakalei developments, located at the makai end of the Kalo'i Gulch drainage basin. We are thankful that Ho'opili shares our concern for the well-being of our neighbors within the Kalo'i watershed, and appreciate the discussion included in the DEIS on drainage issues and the acknowledgement of special storm water discharge restrictions on developments within the Kalo'i Gulch drainage basin on until such time as an ocean outlet is constructed. Essentially, developments within the Kalo'i Gulch drainage basin are not allowed to increase overall flows or channelized storm water flows until there is an ocean outlet for storm water discharge.

The ability to construct the ocean outlet is dependent upon issuance of a conservation district use permit (CDUP) by the State Board of Land and Natural Resources. Haseko has applied for the CDUP, which is now being processed through a contested case proceeding. Although Haseko, as the applicant, and Gentry, as an intervenor, are the only two parties in the contested case in support of the CDUP application, all developments within the Kalo'i Gulch drainage basin will be affected by the decision in this case.

Please note that the location of the proposed ocean outlet is at One'ula Beach Park, and not at 'Ewa Marina (now known as Hoakalei Marina) as stated on page 208 of the DEIS. Because of the potential environmental problems associated with intersecting the Kalo'i Gulch regional drainage system with the Honouliuli sewer outfall pipe, the outlet has been relocated from the marina, which is to the west of the sewer outfall pipe, to the beach park, which lies east of the outfall. In June, 2007, the Honolulu City Council approved this relocation by issuing a special management area use permit for that purpose (Resolution No. 07-118, CD1).

SUBJECT: HO'OPILI DRAFT ENVIRONMENTAL IMPACT STATEMENT

Dear Ms. Maeda:

Thank you for your letter dated April 14, 2008. We have reviewed your letter and offer the following responses to your comments.

1. We acknowledge that developments within the Kalo'i Gulch drainage basin are not allowed to increase overall flows or channelized storm water flows until there is an ocean outlet for storm water discharge. As mentioned in the Draft EIS, with respect to the portion of the project within the Kalo'i drainage basin, the project will be creating on-site detention basins to collect all storm water runoff and discharge the flow at a rate that will not exceed pre-development conditions.

2. We concur that the location of the proposed ocean outlet is at One'ula Beach Park, and not at the Hoakalei Marina (referred to as 'Ewa Marina in the Draft EIS). Table 5.8. Ewa Development Plan – Objectives and Policies (*Section 3.6.2: 'Ewa Marina, Discussion*) of the Final EIS will be revised as follows:

> *Discussion: While the Ewa DP's policies related to the residential development of the 'Ewa Marina are not directly applicable to the Ho'opili project, the Petitioner supports the plan's objectives. While a relatively small portion of the Petition Area lies within the Kalo'i Gulch drainage basin, Ho'opili will be designed to detain future runoff from the site to current flows, until such time as the outlet to the ocean at 'Ewa Marina is opened. During the Draft EIS public review period, HASEKO (Ewa), Inc. wrote: "...the location of the proposed ocean outlet is at One'ula Beach Park, and not at 'Ewa Marina (now known as Hoakalei Marina)...Because of the potential environmental problems associated with intersecting the Kalo'i Gulch regional drainage system with the Honouliuli sewer outfall pipe, the outlet has been relocated from the marina, which is to the west of the sewer outfall pipe, to the beach park, which lies east of the outfall." HASEKO (Ewa), Inc. also wrote: "The ability to construct the ocean outlet is dependent upon issuance of a conservation district use permit (CDUP) by the State Board of Land and Natural Resources. Haseko has applied for the CDUP, which is now being processed through a contested case proceeding."*

AR00027494

Table 5.8. Ewa Development Plan – Objectives and Policies (*Section 4.6.2: Drainage Systems - Planning Principles, Discussion*) of the Final EIS will be revised as follows:

> ***Discussion:*** *While a relatively small portion of the Petition Area lies within the Kalo'i Gulch drainage basin, Ho'opili will be designed to detain future runoff from the site to current flows before entering Kalo'i Gulch, until such time as the outlet to the ocean at 'Ewa Marina is opened. During the Draft EIS public review period, HASEKO (Ewa), Inc. wrote: "...the location of the proposed ocean outlet is at One'ula Beach Park, and not at 'Ewa Marina (now known as Hoakalei Marina)...Because of the potential environmental problems associated with intersecting the Kalo'i Gulch regional drainage system with the Honouliuli sewer outfall pipe, the outlet has been relocated from the marina, which is to the west of the sewer outfall pipe, to the beach park, which lies east of the outfall." HASEKO (Ewa), Inc. also wrote: "The ability to construct the ocean outlet is dependent upon issuance of a conservation district use permit (CDUP) by the State Board of Land and Natural Resources. Haseko has applied for the CDUP, which is now being processed through a contested case proceeding."*

Thank you again for your participation in the Environmental Impact Statement process for this project. Your comment letter and this response will be included in the Final Environmental Impact Statement. If you have any questions regarding this project, please do not hesitate to contact me at 521-5631.

Re: Comments on Draft EIS for Ho'opili project

Dear Mr. Shigekuni:

In August of 2007, the Hawaii State Supreme Court, in reversing the circuit court decision of Sierra Club vs. the State Department of Transportation, mandated, as a matter of law, the state DOT to conduct an environmental assessment of the Super Ferry which would include an analysis of the secondary and cumulative impacts as well as the primary impacts generated by the operation of the Super Ferry. The Leeward-Central Community Roundtable requests that the final EIS for the Ho'opili development include an analysis of the primary, secondary, and cumulative impacts of the project in the various areas below, which would include the identification of needs and deficiencies, and appropriate mitigation measures.

Traffic:

All references in this section will be to pages within the section, "Appendix L, Traffic Impact Analysis Report" of Volume 2 of the Ho'opili draft EIS.

Below is a combination of Table 2.7 and Table 5.3 of which provides the LOS for Peak-hour Freeway Segment operations. It includes existing conditions, and conditions for the year 2030 with rail but without the Ho'opili project, and conditions for the year 2030 with rail and with the Ho'opili project.

Morning Peak:

#	Freeway	Segment	Existing LOS	2030 without Ho'opili (Includes rail)	2030 with Ho'opili (Includes rail)
1	H-1 EB	S/O Makakilo Dr.	A	E	E
2	H-1 EB	W/O Kunia Rd.	C	F	F
3	H-1 EB	W/O Pa'iwa St.	E	E	F
4	H-1 EB	E/O Kamehameha	D	E	F
5	H-2 SB	At Ka 'Uka Blvd.	D	D	D
6	H-1 WB	S/O Makakilo Dr.	A	C	C
7	H-1 WB	W/O Kunia Rd.	C	C	C
8	H-1 WB	W/O Pa'iwa St.	C	B	C
9	H-1 WB	E/O Kamehameha	C	C	C

AR00027495

Afternoon Peak:

#	Freeway	Segment	Existing LOS	2030 without Ho'opili (Includes rail)	2030 with Ho'opili (Includes rail)
1	H-1 EB	S/O Makakilo Dr.	B	D	E
2	H-1 EB	W/O Kunia Rd.	D	D	D
3	H-1 EB	W/O Pa'iwa St.	C	D	E
4	H-1 EB	E/O Kamehameha Hwy.	B	D	E
5	H-2 SB	At Ka 'Uka Blvd.	B	C	C
6	H-1 WB	S/O Makakilo Dr.	B	F	F
7	H-1 WB	W/O Kunia Rd.	C	E	F
8	H-1 WB	W/O Pa'iwa St.	E	C	D
9	H-1 WB	E/O Kamehameha Hwy.	E	E	F
10	H-2 NB	At Ka 'Uka Blvd.	C	F	F

1. Your report states on page 7 states that "traffic impact" will be indicated when an LOS deteriorates to E or worse. As the table shows, four of the five Honolulu-bound Morning segments and seven of the ten segments both ways in the Afternoon show such loss when comparing the existing conditions to 2030 conditions with Ho'opili. However, table 5.3 shows "traffic impact" for only two of the morning segments and five of the afternoon segments. You arrive at this favorable "no-impact" designation by comparing "2030 with Ho'opili" only with "2030 without Ho'opili." Ho'opili is likely to begin construction before a number of other projects in the area, yet your action treats all other projects as if they come first. We request that the final EIS compare "existing conditions" with "2030 with Ho'opili" in determining traffic impact. Traffic impact status for four morning segments and seven afternoon segments seems warranted.

2. The "Chapter 7 Conclusion" on page.7-1 of your "Traffic Analysis Report" mentions intersections, concluding that, with mitigation, only one intersection will have "traffic impact." The Conclusion however, is seriously flawed in that it does not mention freeway segments at all, and ignores the "traffic impact" in the four morning segments and seven afternoon segments.

3. The Conclusion is further flawed in that it also does not mention unacceptable conditions for Ramp-Freeway Junction Operation, even though page 3-22 states that three in the morning and three in the afternoon are unacceptable, and Table 3.4 shows six of twenty Ramp Junctions for 2030 at LOS E or F. Mitigation for only one ramp is discussed at Impact 6.1.2F. The Conclusion for the final EIS should show "traffic impact" for six of the twenty Ramp Junctions.

4. The Conclusion seems further flawed in its assessment of impact on traffic intersections, both in that it presumes its lane-change mitigation measures will work, and in that it includes in mitigation efforts changes in habit by the population which have never been achieved before: such as carsharing, rent subsidies, and transit subsidies by employers. Given the concerted efforts of the DOT to ease traffic congestion through creative re-striping and other changes over the last several years, it is questionable why the solutions proposed have not been adopted by the DOT if they so assuredly will work. We request that all mitigation proposals be discussed with the DOT and DTS and that their answers be recorded in the conclusion. Please comment on the feasibility of the state or city acting on each, and the cost. We request that the Conclusion restate the number of intersections which will have traffic impact in light of those conversations.

5. The Tables showing existing conditions, and Scenario A, year 2030 conditions without and with the project list volume, density and LOS, but the do not show time spent in traffic. What are the times spent in traffic for the various sites? Please show current and 2030 Scenario A figures without and with the project.

6. The draft EIS only studies freeway segments as far east as the H-1/H-2 merge. Heavy traffic continues on into the city of Honolulu. This project will surely affect traffic all the way into town. We request that the final EIS contain studies of segments for the rest of the freeway.

7. The draft EIS discusses intersections and on/off ramps. In doing so, it combines all of the lanes of an intersection or ramp. While one lane may be an LOS F, it can be balanced off with a lane that is an A to make the intersection or ramp a C. Please make an additional, separate listing of all LOS E and F lanes so that they can easily be identified, and note the time backed up in each.

8. Moving to points not mentioned in the draft EIS: Ho'opili will occupy what can be pictured as a triangle, bordered on two sides by the two busiest roadways in West O'ahu. The tip of the triangle, where the two roadways converge, will continue to be the choke point for two roads. Both sides of one roadway, H-1, are open space for miles before the merge. There is a small number of homes (a few hundred) in West Loch, on one side of the other road, Ft. Weaver Rd. The many thousands of cars that feed into the H-1/Ft. Weaver merge at the tip of the triangle now pass this open space. When the 12,000 homes of Ho'opili fill the triangle, all of the homes of Ho'opili will be closer to the merge than any of the homes from which the thousands of cars now traveling the roads come. The 7069 cars from Ho'opili will empty onto Ft. Weaver and H-1 *in front of* the thousands of current travelers during peak hours each morning. The 12,077 cars returning to Ho'opili in the afternoon will slow the cars returning to farther distances. What effort is being made or will be made to inform those thousands of drivers, already enduring great traffic problems, that traffic from 12,000 homes will feed into the merge ahead of them? What efforts are being made or will be made to collect their input?

9. The draft EIS does not address the secondary and cumulative costs to drivers in physical health, mental health, loss of family time, and early death. What are these? What are the affects for latch-door kids? How much will the delay in traffic cause the people affected in child care? How much in gasoline? Please calculate these things for the entire trip to and from the city of Honolulu.

AR00027496

Agriculture:

"Appendix A, Agricultural Impact Analysis" discusses loss of agricultural lands, but does not discuss the nature of those lands. It also does not discuss the climate of the area which is an important factor in what plants can be grown.

The book, *Detailed Land Classification – Island of Oahu* Bulletin No. 11, December 1972 by the Land Study Bureau – University of Hawaii, classifies all lands on Oahu on a scale of A to E. Those classified as A and B are "prime agricultural lands." All of the flat land in the Ho'opili project is classified as "prime agricultural lands." Much of it is classified as A. These lands are extremely rich. Climate is another factor. There are other "prime agricultural lands" which have not been covered with housing, but few exist in such a sunny area, with mild winds. These lands were called the golden triangle in sugar plantation days. We request that the final EIS study what other places on the island could be found which mimic the desirable conditions of the Ho'opili lands. This would include a study of the best land and climate characteristics for growing the various crops that are being grown and have been grown on the property since sugar times.

Because of the high price of gasoline, two airlines that service Hawaii and one mainland airline declared bankruptcy and stopped flying this week. Experts tell us that the price of gasoline will never return to prices we have known in the past. Rather, with the emergence of automobiles in China and India, we can only expect higher and higher gasoline prices. Other airlines will eventually be forced into bankruptcy. And it may be necessary for Oahu to produce all the crops that feed our people. We request that the final EIS study this situation – specifically how much land at what land classifications (A to E) and under what climatic conditions (sun and wind) does Oahu need to sustain the anticipated 2030 number of people on the island. Further, please report in the EIS on the connection of gasoline price to and cost of shipping, and at what price the cost of gasoline will make it unfeasible to bring in food by air.

Water:

The several appendices on Water discuss a number of aspects—available potable and non-potable water, and drainage. There is no discussion on the aquifer itself and the effect housing, as opposed to current farmland, will have on water draining down to replenish the waters below. Although water seeps down only to the caprock in this area, rather than seeping down to refill the aquifer, the fresh water above the caprock is necessary to keep the salt water from flowing into the aquifer. We request that the final EIS present a study of this replenishment of fresh water to hold back the saltwater.

Rising seas also will bring seawater towards the aquifer. Lower brackish water above the caprock will allow the flooding of the clear water in the aquifer. We ask that the study of the water needed to hold back the seawater and the ways the water above the caprock can be replenished if the housing is build be included in the EIS.

Finally, this island has already reached its carrying capacity in regard to water. Thus the fear about the loss of brackish water from seepage in the Ho'opili area. Charges for desalinated water will be higher than water from the aquifer. We request a study of water on O'ahu in general to establish that this project will not in any way move the island toward need for desalinated or otherwise reclaimed water..

Culture:

Appendix F of Volume 2 "Cultural Impact Assessment" spends roughly one hundred pages discussing ancient Hawaiian culture and concludes that "no contemporary or continuing cultural practices currently occur within the proposed Project Area.

Appendix F does not mention local culture, local lifestyle, or pidgin. The west side of the island over the last near-century has been the local people's side of the island. There has been a local culture practiced here for decades. Newcomers and new ways are a great threat to that culture.

On page 18 of Appendix K, under "In-Migrant Population," it is stated that 660 FTE part-time/second home buyers or off-island retirees will reside in Ho'opili. That is roughly 5% of the 12,000 anticipated homes in Ho'opili. This does not begin to match the reality in other new developments on the island.

We request that this study come up with realistic numbers for newcomers. And we request that an assessment the impact of these in-migrants on local culture be conducted.

Tourism:

The EIS does not have a study of the effect of Ho'opili on tourism. Surely, toursists come to Hawaii to see a lush tropical paradise. They do not expect to see urban sprawl covering the island. The green space between Waipahu and Kapolei (the area that will be covered by Ho'opili) is a necessary break from urbanization and needs to be preserved. Without the break, tourists will find solid city from Hawaii Kai to Makaha.

The 'Ihilani, the Vacationclub timeshares, and the new Disney hotel at Ko 'Olina are basing publicity on "the other Hawaii." Tourists need the experience of seeing some country, some of the tropical green of paradise, as they drive to Ko 'Olina. Otherwise, it is no different from Waikiki, only further away.

We request that the final EIS have a study of the affect of the urbanization of this area on tourism, and that this study include interviews with prominent figures in tourism on Oahu.

Sincerely,

Dr. Kioni Dudley

SUBJECT: HO'OPILI DRAFT ENVIRONMENTAL IMPACT STATEMENT

Dear Dr. Dudley:

Thank you for your letter dated April 7, 2008. We have reviewed your letter and offer the following responses to your comments:

Traffic

Leeward – Central Community Roundtable Comment: Your report states on page 7 states that "traffic impact" will be indicated when an LOS deteriorates to B or worse. As the table shows, four of the five Honolulu-bound Morning segments and seven of the ten segments both ways in the Afternoon show such loss when comparing the existing conditions to 2030 conditions with Ho'opili. However, table 5.3 shows "traffic impact" for only two of the morning segments and five of the afternoon segments. You arrive at this favorable "no-impact" designation by comparing "2030 with Ho'opili" only with "2030 without Ho'opili." Ho'opili is likely to begin construction before a number of other projects in the area, yet your action treats all other projects as if they come first. We request that the final EIS compare "existing conditions" with "2030 with Ho'opili" in determining traffic impact. Traffic impact status for four morning segments and seven afternoon segments seems warranted.

Response: As requested, a new Table 4.13 (Comparison of Existing Traffic and Year 2030 Traffic With and Without the Project) will be added to the Final EIS.

Table 4.13. Comparison of Existing Traffic and Year 2030 Traffic With and Without the Project

MORNING PEAK				INCLUDES RAIL:	INCLUDES RAIL:
#	Freeway	Segment	Existing LOS	2030 without Ho'opili	2030 with Ho'opili

Source: Wilbur Smith Associates, Traffic Impact Analysis Report for Ho'opili (2007)

AR00027498

Leeward – Central Community Roundtable Comment: The "Chapter 7 Conclusion" on page.7-1 of your "Traffic Analysis Report" mentions intersections, concluding that with mitigation, only one intersection will have "traffic impact." The Conclusion however, is seriously flawed in that it does not mention freeway segments at all, and ignores the "traffic impact" in the four morning segments and seven afternoon segments.

Response: A paragraph that describes the effects on freeway segments will be added to the Executive Summary as well as Chapter 7 (Conclusion) of a revised TIAR, which will be updated as part of the permitting process.

Leeward – Central Community Roundtable Comment: The Conclusion is further flawed in that it also does not mention unacceptable conditions for Ramp-Freeway Junction Operation, even though page 3-22 states that three in the morning and three in the afternoon are unacceptable, and Table 3.4 shows six of twenty Ramp Junctions for 2030 at LOS E or F. Mitigation for only one ramp is discussed at Impact 6.1.2F. The Conclusion for the final EIS should show "traffic impact" for six of the twenty Ramp Junctions.

Response: As suggested, a paragraph will be added to include a discussion on ramp-freeway junction operations to the Executive Summary as well as Chapter 7 (Conclusion) of a revised TIAR, which will be updated as part of the permitting process.

Leeward – Central Community Roundtable Comment: The Conclusion seems further flawed in its assessment of impact on traffic intersections, both in that it presumes its lane-change mitigation measures will work, and in that it includes in mitigation efforts changes in habit by the population which have never been achieved before: such as car sharing, rent subsidies, and transit subsidies by employers. Given the concerted efforts of the DOT to ease traffic congestion through creative re-striping and other changes over the last several years, it is questionable why the solutions proposed have not been adopted by the DOT if they so assuredly will work. We request that all mitigation proposals be discussed with the DOT and DTS and that their answers be recorded in the conclusion. Please comment on the feasibility of the state or city acting on each, and the cost. We request that the Conclusion restate the number of intersections which will have traffic impact in light of those conversations.

Response: As we understand your comments, it consists of two parts – 1) addressing the traffic impacts through additional or revised lanes at problem intersections, and 2) the feasibility of contra-flow lanes and other Transportation Demand Management (TDM) measures.

The traffic consultant believes that the proposed changes to the lane configurations at these intersections would mitigate the traffic impacts from the Ho'opili development at these anticipated "bottleneck" locations in the area roadway network. The additional lanes would increase capacity for critical traffic movements at each intersection and thereby increase overall intersection capacity and reduce much or all of the forecast additional delays that could otherwise result from the Ho'opili traffic.

The consultant identified the cited potential additional TDM measures and use of contra-flow lanes as additional actions for consideration beyond those that have been proposed for implementation and included in the analyses. The additional TDM actions do include some that have not previously been tried on Oahu and thus were suggested "for consideration" without including any substantial change in the Ho'opili traffic forecasts. The Petitioner will continue to work with the State DOT and City and County of Honolulu Department of Transportation Services (DTS) regarding the feasibility of implementing the various lane changes and TDM actions. The mitigations proposed in the TIAR will be discussed with the DOT and DTS and their answers will be recorded as requested.

Leeward – Central Community Roundtable Comment: The Tables showing existing conditions, and Scenario A, year 2030 conditions without and with the project list volume, density and LOS, but the do not show time spent in traffic. What are the times spent in traffic for the various sites? Please show current and 2030 Scenario A figures without and with the project.

Response: The existing and future traffic conditions were analyzed using traffic models that assess conditions at individual key at-grade intersections and at freeway ramps in the Project vicinity. These particular models were used since the focus was to identify those locations that would be most affected by the increased traffic and to test potential roadway modifications to mitigate the significant adverse impacts of the Project. These models do provide an indication of the change in travel speeds/times through the individual analyzed intersections and freeway ramps, but do not provide an overall change in travel time through the corridor. The travel time information provided includes:

- Key Intersections – The Synchro model used in the study provides the estimated total vehicle delay on each roadway approach and for each traffic movement at the studied intersections. This vehicle delay represents the increased travel time in approaching and slowing for the intersection traffic control as well as the time spent in traffic queue waiting to pass through the intersection. The estimated delay by roadway approach can be found on the intersection worksheets for the existing, 2030 Baseline (without Project), and 2030 with Project scenarios in the Appendices of the Ho'opili TIAR prepared by Wilbur Smith Associates. Comparison of the delays at the intersection approaches along a roadway between the Without Project and With Project scenarios would provide a general approximation of the change in travel time along a route.

- Freeway Ramps – The Highway Capacity Software (HCS) used to analyze the ramp junctions with the Freeway mainline lanes provides the estimated change in traffic speeds for the through freeway traffic and for the ramp traffic along the merging or diverging areas for the key on- and off-ramps providing the Project traffic access to/from the H-Freeway. However, the analysis output does not provide information to directly estimate changes in travel time along a route between scenarios since these speeds apply only to freeway section in the vicinity of the ramp junction.

AR00027499

As the Ho'opili Project progresses through additional studies for the City and County of Honolulu zoning review process, consideration will be given to the use of additional or revised models that could provide travel time estimates.

Leeward – Central Community Roundtable Comment: The draft EIS only studies freeway segments as far east as the H-1/H-2 merge. Heavy traffic continues on into the city of Honolulu. This project will surely affect traffic all the way into town. We request that the final EIS contain studies of segments for the rest of the freeway.

Response: The Oahu Metropolitan Planning Organization (OMPO) regional model used to develop the traffic forecasts takes into account the H-1/H-2 merge. The TIAR is compatible with the regional land use assumptions as part of the master land use plan. These assumptions are reflected in the traffic forecasts developed for this study. We believe the methodology used to prepare the TIAR is consistent with sound traffic engineering practice.

Leeward – Central Community Roundtable Comment: The draft EIS discusses intersections and on/off ramps. In doing so, it combines all of the lanes of an intersection or ramp. While one lane may be an LOS F, it can be balanced off with a lane that is an A to make the intersection or ramp a C. Please make an additional, separate listing of all LOS B and F lanes so that they can easily be identified, and note the time backed up in each.

Response: This information is presented in worksheets in Appendix A. Signal timings for the intersections analyzed under Year 2030 conditions have been optimized based on the traffic volumes in the forecast. The Synchro output worksheets show the level of service (LOS) outputs for the entire intersection as well as for each lane group as requested.

Leeward – Central Community Roundtable Comment: Moving to points not mentioned in the draft EIS: Ho'opili will occupy what can be pictured as a triangle, bordered on two sides by the two busiest roadways in West O'ahu. The tip of the triangle, where the two roadways converge, will continue to be the choke point for two roads. Both sides of one roadway, H-1, are open space for miles before the merge. There is a small number of homes (a few hundred) in West Loch, on one side of the other road, Ft. Weaver Rd. The many thousands of cars that feed into the H-1/Ft. Weaver merge at the tip of the triangle now pass this open space. When the 12,000 homes of Ho'opili fill the triangle, all of the homes of Ho'opili will be closer to the merge than any of the homes from which the thousands of cars now traveling the roads come. The 7069 cars from Ho'opili will empty onto Ft. Weaver and H-1 in front of the thousands of current travelers during peak hours each morning. The 12,077 cars returning to Ho'opili in the afternoon will slow the cars returning to farther distances. What effort is being made or will be made to inform those thousands of drivers, already enduring great traffic problems, that traffic from 12,000 homes will feed into the merge ahead of them? What efforts are being made or will be made to collect their input?

Response: For the morning peak hour, this comment can be addressed by modifying the apportionment of green time at these critical intersections such that the flow of traffic from Ho'opili onto the H-1 freeway is metered. Modification of signal timings or lanes will depend

on the policies and operations that the City and County of Honolulu and the State DOT adopt for signals along Fort Weaver Road.

For the afternoon peak hour, it will be harder to ascertain whether the traffic composition is mostly people commuting to Ho'opili or not. Hence, any penalties directed towards people commuting to Ho'opili might adversely affect other commuters as well.

Leeward – Central Community Roundtable Comment: The draft EIS does not address the secondary and cumulative costs to drivers in physical health, mental health, loss of family time, and early death. What are these? What are the affects for latch-door kids? How much will the delay in traffic cause the people affected in child care? How much in gasoline? Please calculate these things for the entire trip to and from the city of Honolulu.

Response: As noted in the Draft EIS Volume 2, a discussion of the secondary and cumulative impacts of the project on residents can be found in *Chapter Four: Impacts and Mitigations* of the Social Impact Assessment prepared by Belt Collins Hawaii Ltd. (November 2007). This report was appended to the Draft EIS as Appendix I. A letter clarifying the existing text is included in Appendix I and is underlined below. Among the conclusions reached in this report are:

> *Ho'opili has been planned with the reduction of traffic impacts in mind. First, it includes transit-oriented development. Bus lines have been identified to encourage residents throughout the project to use rapid transit or to use buses or bicycles within the project area. Street sizes and connectivity will encourage pedestrian and bicycle movement. To the extent that automobile use declines (or Ho'opili attracts new residents who are less committed to automobile use than others), residents can expect to have more exercise, and be healthier than people in other subdivisions of Leeward Oahu...*
>
> *Ho'opili will contribute to the growth of the urban community life in Ewa by providing new job locations, recreational areas, and schools as well as housing. <u>It is designed as a community in which many residents will not need to drive to Honolulu often.</u> Its transportation planning will work to address the region's serious traffic congestion problems. It will help to link existing and new communities, serving its neighbors as well as its residents.*

The above paragraphs will be added to page xi in the Executive Summary of the Final EIS. In sum, your concern with the impacts of traffic congestion is understandable. We share it. Ho'opili has been planned to minimize or avoid adverse traffic impacts and consequent social impacts.

<u>Agriculture</u>

Leeward – Central Community Roundtable Comment: "Appendix A, Agricultural Impact Analysis" discusses loss of agricultural lands, but does not discuss the nature of those lands. It also does not discuss the climate of the area which is an important factor in what plants can be grown.

AR00027500

Response: The "nature of those lands" were described in *Hoopili: Impact on Agriculture* (Appendix A of the Draft EIS Volume 2) on pages 2 through 16, including: soil types; various Federal and State soil ratings; soil characteristics; summary of arable land; elevations; terrain; climatic conditions (solar radiation, rainfall, temperature, winds and storms); irrigation water; road access; potential crops; locational advantages and disadvantages for crop production; surrounding land uses; historic agricultural uses; and existing agricultural operations.

Leeward – Central Community Roundtable Comment: The book, Detailed Land Classification — island of Oahu Bulletin No. 11, December 1972 by the Land Study Bureau — University of Hawaii, classifies all lands on Oahu on a scale of A to E. Those classified as A and B are "prime agricultural lands." All of the flat land in the Ho'opili project is classified as "prime agricultural lands." Much of it is classified as A. These lands are extremely rich. Climate is another factor. There are other "prime agricultural lands" which have not been covered with housing, but few exist in such a sunny area, with mild winds. These lands were called the golden triangle in sugar plantation days. We request that the final EIS study what other places on the island could be found which mimic the desirable conditions of the Ho'opili lands. This would include a study of the best land and climate characteristics for growing the varions crops that are being grown and have been grown on the property since sugar times.

Response: If the question being posed is: "are there any lands which are exactly like the Petition Area?" then the answer would be that there are no other lands on Oahu with similar soils and climatic conditions other than the soils underlying the proposed UHWO and DHHL East Kapolei projects. As described in *Hoopili: Impact on Agriculture* (Appendix A of the Draft EIS Volume 2), the soils underlying the Petition Area are suited for low-elevation crops. While portions of the Petition Area may have been referred to as the "Golden Triangle" because of higher sugar yields than other lands cultivated for sugar cane, one cannot construe that all crops grown in the Golden Triangle would necessarily gross the highest yields.

Hoopili: Impact on Agriculture (Appendix A of the Draft EIS Volume 2) identifies a total of 10,900 acres of former plantation land remaining on Oahu which are available for other crops, including 3,150 acres of former pineapple land in Kunia and 7,750 acres on the North Shore. It is acknowledged that some of the higher elevation fields in Kunia and on the North Shore have less solar radiation than Ewa and lands in higher elevations incur higher pumping costs. Nevertheless, some limitations can be overcome with investment in improvements such as to existing water delivery systems.

Leeward – Central Community Roundtable Comment: Because of the high price of gasoline, two airlines that service Hawaii and one mainland airline declared bankruptcy and stopped flying this week. Experts tell us that the price of gasoline will never return to prices we have known in the past. Rather, with the emergence of automobiles in China and India, we can only expect higher and higher gasoline prices. Other airlines will eventually be forced into bankruptcy. And it may be necessary for Oahu to produce all the crops that feed our people. We request that the final EIS study this situation — specifically how much land at what land classifications (A to B) and under what climatic conditions (sun and wind) does Oahu need to sustain the anticipated 2030 number of people on the island. Further, please report in the EIS on the connection of

gasoline price to and cost of shipping, and at what price the cost of gasoline will make it unfeasible to bring in food by air.

Response: While we would concur that rising fuel and transportation costs are of concern, it is interesting to note that Mauna Kea Banana Company recently announced it was ending its banana production citing rising fertilizer and energy costs. So the opposite result from what you are anticipating may actually be occurring.

Water

Leeward - Central Community Roundtable Comment: The several appendices on Water discuss a number of aspects—available potable and non-potable water, and drainage. There is no discussion on the aquifer itself and the effect housing, as opposed to current farmland, will have on water draining down to replenish the waters below. Although water seeps down only to the caprock in this area, rather than seeping down to refill the aquifer, the fresh water above the caprock is necessary to keep the salt water from flowing into the aquifer. We request that the final EIS present a study of this replenishment of fresh water to hold back the saltwater.

Rising seas also will bring seawater towards the aquifer. Lower brackish water above the caprock will allow the flooding of the clear water in the aquifer. We ask that the study of the water needed to hold back the seawater and the ways the water above the caprock can be replenished if the housing is build be included in the EIS.

Finally, this island has already reached its carrying capacity in regard to water. Thus the fear about the loss of brackish water from seepage in the Ho'opili area. Charges for desalinated water will be higher than water from the aquifer. We request a study of water on O'ahu in general to establish that this project will not in any way move the island toward need for desalinated or otherwise reclaimed water.

Response: Per your comments, we have consulted with Tom Nance Water Resource Engineering and we will revise the first paragraph of Section 3.5 *Groundwater Resources/Hydrology, Existing Conditions* of the Final EIS as follows:

> *The 'Ewa region of O'ahu overlies the Southern O'ahu Basin Aquifer (SOBA), a designated Sole Source Aquifer. Drinking water supply is drawn from this aquifer in the volcanic formation at depth. According to Tom Nance Water Resource Engineering, the piezometric head of this aquifer, which is inland and directly beneath the Ho'opili site, is about 18 feet above sea level.*
>
> *The gently sloping topography of the 'Ewa Plain is comprised of terrestrial alluvium, which is made up of clay and mud eroded from volcanic rock. The terrestrial alluvium is inter-layered with coral limestone deposited during periods when the area was covered by the ocean. This geologic feature is commonly referred to as "caprock." The caprock overlies these volcanics to the near vicinity of Farrington Highway. In cross section, the caprock is wedge-shaped. It is about 1,000 feet thick at the shoreline and tapers to just a few tens of feet thick in the vicinity of Farrington Highway. It is comprised primarily of*

AR00027501

limestone and marl on its seaward half (makai of OR&L Railroad right-of-way) and primarily terrestrial alluvium inland of the OR&L Railroad right-of-way. ~~The caprock is located makai of the H-1 Freeway and is approximately 1,000 feet thick near the shoreline.~~

Brackish to saline basal groundwater exists in the upper limestone layer of the caprock. According to Tom Nance Water Resource Engineering, its water level is 1.0 to 1.5 feet above sea level. It is referred to as the caprock aquifer, but it is not present through the entire caprock formation. It is limited to the upper limestone layer. All water in the caprock formation below the thin lens in the upper limestone layer is saltwater. Water in the caprock is too saline to be used for safe drinking water.

Leakage upward from the higher head, volcanic aquifer into the caprock formation does occur, but according to Tom Nance Water Resource Engineering, it is limited to the inland margin of the caprock. This rate of upward leakage is a function of geology and the piezometric head in the volcanics. It is not influenced by the much lower water level in the upper limestone layer of the caprock.

The current irrigation allocation for the Petition Area is 8.0 million gallons per day (MGD). The average irrigation use is approximately 2.0 to 3.0 million gallons per day (MGD), depending on the time of the year.

We will also revise the first paragraph of Section 3.5 *Groundwater Resources/Hydrology, Anticipated Impacts and Mitigation Measures* of the Final EIS as follows:

The total average daily source requirement for ultimate build-out is estimated at 3.9 MGD. The present agricultural use of the Petition Area provides recharge to the alluvial portion of the caprock from excess applied irrigation water. This irrigation return eventually moves into the aquifer in the upper limestone layer of the caprock, becoming a portion of its recharge, albeit a relatively small portion. According to Tom Nance Water Resource Engineering, development of the Ho'opili project will diminish this small component of the recharge to some extent, but will have an immeasurable impact on water level in the upper limestone layer.

The project is not expected to impact groundwater resources, as the caprock acts as a barrier to the drinking water in the Petition Area. The caprock in 'Ewa, around Pearl Harbor, and in Honolulu, does function to retard seawater intrusion into the drinking water aquifer in the volcanics. According to Tom Nance Water Resource Engineering, it is an incredibly important contribution to the availability of drinking water which comes about due to the mostly impermeable contact surface between the volcanics and the overlying caprock. It is not due to the water level in the caprock.

Both the drinking water aquifer in the volcanics and the brackish to saline aquifer in the caprock's upper limestone layer are in hydraulic contact with seawater nearshore and offshore. Sea level changes, whether weeks or months long due to large scale whether phenomena in the Pacific or a longer term sea level rise, does cause both aquifers to rise

or fall accordingly. According to Tom Nance Water Resource Engineering, the Ho'opili project will have no impact on sea level changes.

Although the Petition Area is situated mauka of the UIC line, no injection wells or cesspools will be installed (since the project's wastewater collection system will eventually connect to the Honouliuli Wastewater Treatment Facility), and any runoff or wastewater disposal required for the project will be managed in full compliance with State Department of Health (DOH) regulations. Irrigation for landscaping will utilize brackish water from the 'Ewa caprock and/or treated effluent (R-1 quality) from the City and County of Honolulu's Honouliuli Wastewater Treatment Facility (if available) to facilitate the recharge of caprock water and to reduce the demand for safe drinking water from the BWS system.

Probably like any other region where a directed growth policy is in place. O'ahu has a finite supply of potable quality groundwater, meaning development using additional groundwater will eventually result in the need for desalination. The proposed project is not unique in this regard. BWS has long range plans to develop a desalination plant at the makai end of Campbell Industrial Park to ultimately meet the island's needs.

Culture

Leeward - Central Community Roundtable Comment: Appendix F of Volume 2 "Cultural Impact Assessment" spends roughly one hundred pages discussing ancient Hawaiian culture and concludes that "no contemporary or continuing cultural practices currently occur within the proposed Project Area.

Appendix F does not mention local culture, local lifestyle, or pidgin. The west side of the island over the last near-century has been the local people's side of the island. There has been a local culture practiced here for decades. Newcomers and new ways are a great threat to that culture.

Response: We acknowledge your concern that the Cultural Impact Assessment does not mention local culture, local lifestyle, or pidgin. However, the guidelines set forth in the Cultural Impact Assessment were designed to fulfill the mandate to the Land Use Commission from the Hawai'i State Supreme Court in its ruling, *Ka Pa'akai O Ka 'Aina v. Land Use Commission, State of Hawai'i*. 94 Haw. 31 (2000). The specific section of the ruling that served to guide the development of the report is as follows:

In order for the rights of native Hawaiians to be enforceable, an appropriate analytical framework for enforcement is needed. Such an analytical framework must endeavor to accommodate the competing interests of protecting native Hawaiian culture and rights on the one hand, and economic development and security, on the other.

As such, the Cultural Impact Assessment is founded on the native Hawaiian traditions, customs and practices, rather than the local culture, lifestyle and language in general.

AR00027502

Leeward - Central Community Roundtable Comment: On page 18 of Appendix K, under "In-Migrant Population," it is stated that 660 FTE part-time/second home buyers or off-island retirees will reside in Ho'opili. That is roughly 5% of the 12,000 anticipated homes in Ho'opili. This does not begin to match the reality in other new developments on the island.

We request that this study come up with realistic numbers for newcomers. And we request that an assessment the impact of these in-migrants on local culture be conducted.

Response: The 660 in-migrants reflect Mikiko Corporation's projection of part-time resident or retiree households that might settle in Ho'opili, who have previously lived off-Island. In addition, the Mikiko Corporation study estimates that approximately 2,170 persons could settle on O'ahu, at Ho'opili or elsewhere, due to employment opportunities generated by the development and operations of Ho'opili. Thus, the project's total population impact for O'ahu is estimated at 2,830 persons. This was addressed on pages 19 – 20 and 39 of the *Economic and Fiscal Impact Assessment for Ho'opili* (Appendix K of DEIS Volume II).

The City and County of Honolulu's affordable housing guidelines require that some 30% of the units at Ho'opili be occupied by primary residents. The projected 660 in-migrants to O'ahu is a full-time equivalent (FTE) population estimate based on 7% of the other 70% of units at the Project that would be sold as market-priced units. Thus, some 7% of sold market units at the Project are estimated to be used as part-time or retirement residences for persons who previously lived off-Island. The population projection also assumes an average 50% occupancy on such units (6 months of any given year), and an estimated 2.3 persons per occupied unit. These usage factors are considered potentially generous, given established patterns of part-time occupancy elsewhere in the State, and the location and nature of Ho'opili.

Ho'opili is not planned to offer the infrastructure that tends to attract part-time residents or retirees from off-Island. It will have no golf course and no resort amenities; neither does the site does offer ocean access or views. Rather, Ho'opili is planned as a primary residential mixed-use community that will offer significant jobs within and near to the Project itself.

<u>Tourism</u>

Leeward - Central Community Roundtable Comment: The EIS does not have a study of the effect of Ho'opili on tourism. Surely, tourists come to Hawaii to see a lush tropical paradise. They do not expect to see urban sprawl covering the island. The green space between Waipahu and Kapolei (the area that will be covered by Ho'opili) is a necessary break from urbanization and needs to be preserved. Without the break, tourists will find solid city from Hawaii Kai to Makaha.

The 'Ihilani, the Vacationclub timeshares, and the new Disney hotel at Ko 'Olina are basing publicity on "the other Hawaii." Tourists need the experience of seeing some country, some of the tropical green of paradise, as they drive to Ko 'Olina. Otherwise, it is no different from Waikiki, only further away.

We request that the final BIS [EIS] have a study of the affect of the urbanization of this area on tourism, and that this study include interviews with prominent figures in tourism on Oahu.

Response: You raise an interesting issue. Currently, views from Ko 'Olina towards Diamond Head yield views of Campbell Industrial Park; views towards Wai'anae, yield views of Kahe Power Plant; and views towards mauka, yield views of Honokai Hale. All of the surrounding urban developments were in place before Ko 'Olina was proposed. Development in East Kapolei (encompassing Ho'opili) and Ko 'Olina has long been a part of the "Campbell Estate Ewa Master Plan." We acknowledge your concern regarding the effect urbanization may have on tourism, however this area has been slated for future development and is within the Urban Growth Boundary in the Ewa Development Plan. As such, we believe that a study regarding the effect of Ho'opili on tourism is not warranted.

Thank you again for your participation in the Environmental Impact Statement process for this project. Your comment letter and this response will be included in the Final Environmental Impact Statement.

If you have any questions regarding this project, please do not hesitate to contact me at 521-5631.

Sincerely,

PBR HAWAII

Dear Applicant,

RE: HOOPILI MASTER PLANNED MIXED USE COMMUNITY

COMMENT ON DRAFT ENVIRONMENTAL IMPACT STATEMENT (DEIS)

THE EAST WEST CONNECTOR ROAD SHOULD BE MANDATED AS A REQUISITE TO BE COMPLETED AND OPEN FOR PUBLIC USE PRIOR TO PERMITTING THE ADDITION OF HOUSING DEVELOPMENT TO OCCUR ON THE PROJECT.

I AM FOR THE DEVELOPMENT OF THE PROPERTY AND SUPPORT THE RENDERINGS SO FAR PROVIDED BY THE APPLICANT TO ADORN THE LANDSCAPE.

HOWEVER, TO APPROVE OF THE DEVELOPMENT SCHEME WITHOUT A TIMELINE, WITHOUT A DEADLINE, WITHOUT A PLAN TO CONSTRUCT THE EAST WEST ROAD SOONER THAN LATER, WOULD BE AN ERRANT ACT.

FURTHERMORE, SINCE THE EAST WEST ROAD WILL BE COMPLETED BY THE YEAR 2015 IN ALL OTHER JURISDICTIONS WHERE THE ROAD PASSES THROUGH, SUCH THOROUGHFARE WILL NOT BE AVAILABLE TO SERVE THE EWA BEACH RESIDENTS UNLESS THE APPLICANT COMPLETES THEIR PORTION ASSIGNED TO THEM.

PLEASE PLACE CONDITIONS UPON THE APPLICANT TO BUILD THE EAST WEST CONNECTOR ROAD PRIOR TO AUTHORIZING OR ADVANCING ANY OTHER TYPE OF DEVELOPMENT THAT IS NOT RELATED TO THE ROAD'S CONSTRUCTION.

Respectfully,

Tom Berg

SUBJECT: HO'OPILI DRAFT ENVIRONMENTAL IMPACT STATEMENT

Dear Mr. Berg:

Thank you for your letter dated March 27, 2008. We have reviewed your letter and offer the following response to your comments.

There are several major transportation projects that have been long-planned for 'Ewa. The Ho'opili project has been planned assuming that certain planned transportation projects will be constructed including a portion of North-South Road between Farrington Highway and Kapolei Parkway; a portion of the North-South Road and a new H-1 Freeway interchange; a portion of the intersection of North-South Road and Farrington Highway; the long-planned widening of Farrington Highway fronting Ho'opili; the proposed East-West Connector Road (EWCR) through the Petition Area; and the first segment of the proposed Honolulu High-Capacity Transit Corridor project through the Petition Area.

We are appreciative of your support for the development of the subject property and acknowledge your concern regarding the timing of the construction of the proposed East-West Connector Road. Please note that: 1) Ho'opili has been designed to accommodate an alignment for the EWCR; and 2) DHHL and UHWO will be starting development well before Ho'opili. Please note that the Petitioner, along with DHHL and UHWO, has submitted a letter to the City and County of Honolulu, Department of Planning and Permitting requesting that the EWCR be included in an updated list of projects to be funded under the Ewa Highway Master Plan (Section 33A-1.6(h) of the Revised Ordinances of Honolulu)..

Thank you again for your participation in the Environmental Impact Statement process for this project. Your comment letter and this response will be included in the Final Environmental Impact Statement.

Attention: Vincent Shigekuni

Dear Mr. Shigekuni:

SUBJECT: Draft Environmental Impact Statement for the Ho'opili Project
Ewa, O'ahu, Hawaii

Thank you for the opportunity to review and provide comment. I wanted to compliment D.R. Horton's team for a comprehensive draft environmental impact statement. Their commitment of engaging the community in the planning process is highly regarded. Connectivity, infrastructure, transit-oriented-development, and job creation are all important issues to the Ewa region. The draft identifies and covers all these issues sufficiently. I believe the Ho'opili project encompasses all the elements necessary for a vibrant work, live, learn, and play community.

My concerns are not about the plan, but the execution of the plan. As the past developments have demonstrated along the Ewa plain, the developers have very little influence over the government agencies responsible for building the roads, schools, parks, infrastructure, etc. Gentry and Haseko have built beautiful communities and where they were responsible for the infrastructure and roads the projects are sufficient. But, the city and state road projects sat idle all the while the populations exploded and now the community faces 2 hour commute times to get into town and back. I believe our community has learned from the past and we are calling for the Ho'opili project to be a leader in development.

Ho'opili has an opportunity to incorporate all the learning and wisdom of past developments. Unconventionally, they can ensure that infrastructure, roads, and job creation centers be built before residential units. Focus on constructing connectivity projects, infrastructure, parks, and schools prior to homes. This type of construction execution will provide relief for existing communities. As a sample, Haseko and Gentry completed their portions of Kapolei Parkway which improved circulation within the communities. Though we are still waiting for city's portion of Kapolei Parkway and the state's North-South Road the completion of the developer's portions of Kapolei Parkway has relieved congestion on Ft. Weaver Road.

I realize the financial investment is costly, but our community has suffered long enough. We are counting on the State Land Use Commission to uphold this community expectation.

Sincerely,

SUBJECT: HO'OPILI DRAFT ENVIRONMENTAL IMPACT STATEMENT

Dear Ms. Malama:

Thank you for your letter regarding the Ho'opili Draft EIS. We greatly appreciate the comments on the comprehensiveness of the DEIS, the public engagement process and the project master plan. We have reviewed your letter and offer the following response to your comments.

We acknowledge your concerns regarding the execution of the plan regarding the construction of roads, schools, parks, infrastructure, etc. The Petitioner will continue to coordinate with State and City agencies to ensure that the necessary infrastructure is constructed in a timely manner.

Thank you again for your participation in the Environmental Impact Statement process for this project. Your comment letter and this response will be included in the Final Environmental Impact Statement.

If you have any questions regarding this project, please do not hesitate to contact me at 521-5631.

Vincent Shigekuni

Dear Mr. Shigekuni,

The purpose of this letter is to express my comments on the Ho'opili Draft Environmental Impact Statement that was published in February 2008. As an introduction, I am generally dismayed by the lack of thorough environmental review in this document and I feel that it is not consistent with the intent or spirit of Hawaii's environmental laws. The size of this project requires a full analysis that looks at real alternatives and a wide range of impacts. This document does neither.

My first issue relates to the expected period of development for the project. The estimated completion of 2030 would seem to be at odds with the Land Use Commission's rules related to incremental districting that require substantial completion of the full development of the project within ten years. I did not come across an incremental development plan for the project in the EIS as the rules seem to require. Given this inadequacy and the likely inability to build all of those homes within ten years, it seems at most only a portion of the project should be redistricted out of agriculture to urban at this time and that the most productive agricultural land should not become urban.

My second issue relates to the project's consistency with the rest of Oahu's regional planning. Section 5 of the EIS makes no mention of why such intense urban development is planned in the "urban fringe" areas of Ewa as described in the Oahu General Plan. In fact, this project is outside of the "Secondary Urban Center" as shown in the General Plan where intense urban growth should be directed to minimize sprawl. The Ewa Development Plan describes the project area as residential and within an urban growth boundary, however it makes no mention of the amount of commercial and industrial development described in the project's EIS. As such, General Plan and Ewa Development amendments should be sought for this project so that the island has the chance to debate the level of growth appropriate for these types of undeveloped lands. This is especially necessary since the City is pushing to designate transit stops within the project area which seems like an effort to undermine the authority of the Land Use Commission and permit the project prior to it going through the necessary reviews.

The EIS also uses a desired jobs to housing balance presumably to downplay the substantial traffic impacts of over 160,000 new vehicles on the road per day. Looking at traffic impacts with a "with transit" condition is misleading as it doesn't speak to the likely potential that the train from Waipahu to the project will be expanded during the time it takes to build the project's homes. Also, I just can't see how the creation of only 680 net new jobs in any way justifies the 11, 750 homes planned for the project.

AR00027506

In conclusion, I feel there is much more study needed for this EIS document to be deemed complete. Detailed soils and past agricultural production studies are needed to determine what land should be ruled out of this redistricting as I hope the project area will downsize. In addition, more detailed studies on traffic impacts along the H-1 Freeway are needed to understand whether the island has the capacity to absorb those 160,000 cars. Additional study is also needed to assess the regional capacities that will likely be strained by this project. I am particularly concerned about current water sources which will have long dried up by 2030.

The alternatives to the project discussed in Section 6 are woefully inadequate. How can alternatives honestly be evaluated with less than one page of available material each and without any comparable studies to back up the assertions made?

I hope there are many more government reviews to evaluate this project if it remains in its current form. In addition to the added City processed I mention in this letter, I feel an intervention with the Land Use Commission is necessary to downsize this project and to make sure that someone identifies that the County is currently setting the stage for development by identifying transit stops before the Commission has had a chance to deliberate.

Sincerely,

Agnes Patopan, Esq.

SUBJECT: HO'OPILI DRAFT ENVIRONMENTAL IMPACT STATEMENT

Dear Ms. Patopan:

Thank you for your letter. We have reviewed your letter and offer the following responses:

Ms. Patopan's Comment: The purpose of this letter is to express my comments on the Ho'opili Draft Environmental Impact Statement that was published in February 2008. As an introduction, I am generally dismayed by the lack of thorough environmental review in this document and I feel that it is *not* consistent with the intent or spirit of Hawaii's environmental laws. The size of this project requires a full analysis that looks at real alternatives and a wide range of impacts. This document does neither.

Response: We acknowledge your concerns about the document and will be revising the EIS, where necessary. We hope our responses and revisions will address the concerns you specify in the rest of your letter.

Ms. Patopan's Comment: My first issue relates to the expected period of development for the project. The estimated completion of 2030 would seem to be at odds with the Land Use Commission's rules related to incremental districting that require substantial completion of the fill development of the project within ten years. I did not come across an incremental development plan for the project in the EIS as the rules seem to require. Given this inadequacy and the likely inability to build all of those homes within ten years, it seems at most only a portion of the project should be redistricted out of agriculture to urban at this time and that the most productive agricultural land should not become urban.

Response: As requested, the preliminary phasing and timing of the proposed project will be provided in the Final EIS. Section 2.7 *Development Timetable and Preliminary Costs* of the Final EIS will be revised as follows:

AR00027507

The Petitioner estimates that the development of the Ho'opili project (major off-site and on-site infrastructure improvements including grading, drainage, sewer, safe-drinking water, non-potable water, roadways, landscaping and improvements to Farrington Highway and North-South Road for access) will cost approximately $4.6 billion (in Year 2007 dollars), spent over the project timeline of 2009 – 2030. During the public review period, both the Land Use Commission and the State Office of Planning made reference to subsection 15-15-50, Hawaii Administrative Rules (HAR). Subsection 15-15-50, HAR identifies the form and contents of a petition to the State Land Use Commission to amend the State Land Use District Boundaries, including representing "...that development of the subject property in accordance with the demonstrated need therefore will be accomplished before ten years after the date of commission approval. In the event full urban development cannot substantially be completed within such period, the petitioner shall also submit a schedule for development of the total of such project in increments together with a map identifying the location of each increment, each such increment to be completed within no more than a ten-year period." The construction of Ho'opili's development will be a challenging process that will require ongoing coordination between many fundamental parts. Infrastructure and road access, neighboring property development, demands of the commercial and housing markets, careful continued agriculture and general property management, and economic viability will all be considered throughout the construction planning process. Furthermore, the City & County of Honolulu's (City) transit project, the largest public works endeavor in Hawaii's history, will within Ho'opili have its longest traverse through privately owned property and further expand development challenges undoubtedly in unprecedented ways. Many of these parts may involve developing different areas of the project site within the same construction timetable as discussed further below.

Several major development priorities include in no particular order:

- ***Water Service from the North.*** *Both of Ho'opili's main potable water storage and transmission systems will reside mauka of H-1. Considerable investment will be required in the construction of tanks and transmission lines that will ultimately service two water zones within Ho'opili that roughly divide the site between northern and southern halves. (Necessary offsite utility easements have already been secured at a price.) Nonpotable water will be sourced from the reclamation operations at the Honouliuli Wastewater Treatment Plant (WWTP), meaning it will be delivered to Ho'opili from the opposite end from where its potable source will come. Preliminary budgetary construction cost estimates range from between $35 million to $40 million with another $20 million possible from BWS for service connections.*

- ***Sewer Service from the South.*** *Unlike Ho'opili's main water system, sewer service will come from the southern end of the property. The first of what is expected to be several Joint Development Agreements (JDA) to secure and construct wastewater transmission is in place with DHHL, UHWO, DLNR and the City and funded. Indeed, the DOT has already constructed this line as part of the North-South Road Phase 1A contract. Discussions are expected to commence later this year in earnest on separate JDAs for two additional segments. Nearly $2 million has already been invested to date,*

preliminary budgetary costs estimates for these two JDAs range from $10 million to $15 million to stub service at the property's southwestern border, $5 million to $10 million to route through to the mauka area and as much as another $60 million for the City's Department of Environmental Services uses connection charges.

- ***Balancing Spread out Access, Initial Infrastructure Needs and Cash Flows.*** *Today, Ho'opili's lands along the Farrington Highway corridor, its northernmost boundary, present Ho'opili's easiest access for construction purposes and future occupants. Once DHHL completes its section of the East-West Connector Road and the State DOT completes the North-South Road (both now under construction), Ho'opili will have construction and occupant access open at its southern and westernmost locations. This is significant because while available for development today, the Farrington Highway corridor is expected to present some of Ho'opili's greatest development challenges, predominantly the distance sewer lines will have to run through undeveloped land for service, as well as timing development to the City's planned improvements to Farrington Highway itself. Thus, the Petitioner will look to mobilize on these other areas as early as practicable. Nonetheless, there are several key commercial parcels in this Farrington Highway corridor that will need to be among the earliest to be marketed in order to generate cash flow to support needed upfront utility (such as water and sewer as detailed above) and road infrastructure throughout Ho'opili. As a result, development should be started in more than one area from the onset. Over the build-out of the project, it is expected that as much as $50 million to $60 million could be spent on drainage systems and hundreds of millions will be invested in roadway systems servicing the project.*

- ***Balancing Job Generation, Appropriate Initial Housing Deliveries and Transit.*** *The majority of the employment areas within Ho'opili are within the Farrington Highway corridor to the north of the property, while the residential development areas that could be most sensible to develop first – the single-family areas – are to the south. Starting housing construction there could generally preserve higher density development in the areas in and around the transit corridor to the north to be better staged with transit's completion and more appropriately address the various demands it will create.*

- ***Managing Agricultural Operations.*** *As lands are moved into development over time, consideration will have to be given to the significant challenges of maintaining a working agricultural water system and providing ongoing and unencumbered vehicular access to crop areas. The objective of the Petitioner is to keep active farms onsite as long as practicable.*

As previously stated the development is expected to occur over approximately 20 years. This area of 'Ewa has long been planned for development (Kapolei Area Long Range Master Plan and Ewa Development Plan).

There are several major transportation projects that have been planned for 'Ewa. The Ho'opili project has been planned assuming that certain planned transportation projects will be constructed including a portion of North-South Road between Farrington Highway and Kapolei Parkway; a portion of the North-South Road and a new H-1

AR00027508

Freeway interchange; a portion of the intersection of North-South Road and Farrington Highway; the long-planned widening of Farrington Highway fronting Ho'opili; the proposed East-West Connector Road through the Petition Area; and the first segment of the proposed Honolulu High-Capacity Transit Corridor project through the Petition Area. As major off-site infrastructure (water, sewer, drainage, electrical and communications) would likely occur in most of the above major road right-of-ways, and the exact timing of the completion of these transportation improvements undetermined, it is difficult for the Petitioner to provide a map identifying the phasing of the proposed action in 10 year increments with any degree of certainty. While the phasing of development may be more relevant where there is little or no development, Ewa has rapidly developed in recent years and proposed transportation improvements are indicative of State and County assumptions that this portion of 'Ewa would be eventually developed.

Ms. Patopan's Comment: My second issue relates to the project's consistency with the rest of Oahu's regional planning. Section 5 of the EIS makes no mention of why such intense urban development is planned in the "urban fringe" areas of Ewa as described in the Oahu General Plan. In fact, this project is outside of the "Secondary Urban Center" as shown in the General Plan where intense urban growth should be directed to minimize sprawl. The Ewa Development Plan describes the project area as residential and within an urban growth boundary, however it makes no mention of the amount of commercial and industrial development described in the project's EIS. As such, General Plan and Ewa Development amendments should be sought for this project so that the island has the chance to debate the level of growth appropriate for these types of undeveloped lands. This is especially necessary since the City is pushing to designate transit stops within the project area which seems like an effort to undermine the authority of the Land Use Commission and permit the project prior to it going through the necessary reviews.

Response: Objective D of the General Plan's Physical Development and Urban Design objectives and policies were discussed on page 173 of the DEIS. Currently the Ewa Development Plan allows for approximately 16,000+ units within the Petition Area, and the Petitioner is proposing significantly less units (11,750). The Petitioner has been coordinating with the Department of Planning and Permitting from even before the Ewa DP Update process was initiated, and we have been advised that this project would be included in the Ewa DP Update process. We will defer your comment on the authority of the Land Use Commission to others.

Ms. Patopan's Comment: The EIS also uses a desired jobs to housing balance presumably to downplay the substantial traffic impacts of over 160,000 new vehicles on the road per day. Looking at traffic impacts with a "with transit" condition is misleading as it doesn't speak to the likely potential that the train from Waipahu to the project will be expanded during the time it takes to build the project's homes. Also, I just can't see how the creation of only 680 net new jobs in any way justifies the 11,750 homes planned for the project.

Response: By "160,000" new vehicles you must be referring to the 158,669 new vehicle trips that are estimated under the "no transit" scenario. Vehicle trips include all estimated travel segments for each vehicle during the day, including such trips to/from: the babysitter, day care

and/or school; work; university; after-school activities; shopping/dining; etc. Please note the traffic impact analysis report addressed the impact of traffic at full development (year 2030). Construction of the Honolulu High-Capacity Transit Corridor project is expected to start in 2009 and the minimum operating segment (from East Kapolei to Ala Moana) will hopefully be completed well before 2030.

We made an error in the DEIS and incorrectly summarized the Economic and Fiscal Impact Assessment attached to the DEIS as Appendix K ("Economic and Fiscal Impact Assessment for Hoopili," Mikiko Corporation, August 2007. The last two paragraphs of Section 4.7.5 *Employment, Anticipated Impacts and Mitigation Measures* of the Final EIS will be revised to read as follows:

The project is expected to generate approximately 66,600 full-time equivalent (FTE) person-years of development related jobs during the construction phase of the project. The project will generate direct jobs via on-site retail and office facilities at Ho'opili's business park. Excluding those jobs that may relocate to Ho'opili from elsewhere in the State, approximately ~~680~~ 1,550 net new jobs are expected to be created (by 2030) through direct employment associated with the project. In addition, the project will generate indirect jobs via the supply of goods and services. Applying State employment multipliers to the project, approximately 870 jobs will be created through indirect employment associated with the project.

At full build out, employment associated with the Petition Area ~~employment~~ is expected to account for approximately 7,000 ~~1,550 net~~ new jobs. Consistent with the Ewa DP and the Kapolei Area Long Range Master Plan, the new jobs will generate employment in 'Ewa to reduce the need for residents traveling to downtown Honolulu for work-related purposes.

Ms. Patopan's Comment: In conclusion, I feel there is much more study needed for this EIS document to be deemed complete. Detailed soils and past agricultural production studies are needed to determine what land should be ruled out of this redistricting as I hope the project area will downsize. In addition, more detailed studies on traffic impacts along the H-1 Freeway are needed to understand whether the island has the capacity to absorb those 160,000 cars. Additional study is also needed to assess the regional capacities that will likely be strained by this project. I am particularly concerned about current water sources which will have long dried up by 2030.

Response: Decision Analysts, Inc. prepared an agricultural impact assessment report which was appended to the DEIS as Appendix A. The report addresses soils in details and past and current agricultural production in the area, on Oahu and statewide. In summary, the report found that there is more than adequate area statewide for diversified agriculture.

In regards to your comments about "160,000 cars" as we noted earlier, the impact of 158,669 new vehicle trips that are estimated under the "no transit" scenario was evaluated in the Traffic Impact Analysis Report and included in the DEIS in its entirety as Appendix L ("Traffic Impact Analysis Report (TIAR), Hoopili, Oahu, Hawaii, Wilbur Smith & Associates, February 2008).

AR00027509

Regarding your comments on water, please note that a Conceptual Water Master Plan addressing safe drinking and non-potable water facilities was prepared and reproduced in its entirety and attached to the Draft EIS as Appendix M for BWS review and approval.

Ms. Patopan's Comment: The alternatives to the project discussed in Section 6 are woefully inadequate. How can alternatives honestly be evaluated with less than one page of available material ach and without any comparable studies to back up the assertions made?

Response: Based on your comments, Section 6.0 *Alternatives To The Proposed Action* of the EIS will be revised as follows:

In compliance with the provisions of Title 11, Department of Health (DOH), Chapter 200, Environmental Impact Statement Rules, Section 11-200-10(6), the alternatives considered are limited to those that would satisfy the objectives of the proposed mixed-use development, while minimizing the potential for adverse environmental impacts. The feasible alternatives must realistically address the project's economic characteristics while also responding to the surrounding land uses that will be impacted by the project. In conformance with applicable regulations, other possible alternatives have been investigated to identify alternative sites, the appropriate uses for the property, and how they would best be accomplished.

6.1 "NO-ACTION" ALTERNATIVE

The "no-action" alternative would not be consistent with stated governmental policies, which direct future growth to the 'Ewa region. The City and County of Honolulu General Plan states:

> *Encourage development within the secondary urban center at Kapolei and the 'Ewa and Central Oahu urban-fringe areas to relieve developmental pressures in the remaining urban-fringe and rural areas and to meet housing needs not readily provided in the primary urban center.*

Under this alternative, the site would remain as agricultural land, underutilized in terms of meeting the demand for residential homes (including affordable homes) and accompanying land uses. The potential benefit of this alternative is that while remaining under cultivation, the site would provide open space. Implementation of this alternative will avoid: infrastructure impacts (solid waste, wastewater and additional stormwater runoff generated on site); visual impacts (appearance of the site changing from agricultural fields to a master-planned urban development); the loss of agricultural employment; traffic impacts; and construction-related impacts (such as construction noise, construction equipment exhaust emissions, temporary traffic disruption, fugitive dust and soil erosion). Occasionally, however, continued cultivation, harvesting and plowing of the site will expose soils to the erosional forces of wind and rainfall. The demand for housing could result in the following scenarios or combinations thereof: there would be more pressure to develop in the other districts, including the rural areas and other areas currently used for cultivation; there could be a demand for higher

density housing in undeveloped areas of 'Ewa at a density not experienced to date; there would be more "doubling up" (larger number of persons per household, with more than one family under roof); those that are not willing to put up with the previously described scenarios may decide to relocate to the U.S. mainland where housing prices have dropped.

The "no-action" alternative was rejected because it is not consistent with government plans to develop Kapolei as the Second City.

6.2 ALTERNATIVE SITES

There are very few large parcels left on O'ahu that are designated for residential development. The largest amount of developable land that is undeveloped lies in Central O'ahu and on the North Shore. As shown on the Ewa Development Plan, the Petition Area is designated mostly Low and Medium Density Residential. As such, the City and County of Honolulu has long recognized that the Petition Area is best used for residential and other development. Directing growth to 'Ewa and in the "urban-fringe" portions of Central O'ahu reduces the pressure to develop outside of the Urban Growth Boundary of Central O'ahu, and the North Shore, Ko'olau Loa, Ko'olau Poko and Wai'anae districts. This alternative has been rejected because it would be clearly contrary to General Plan policy. The potential benefit of this alternative is that for those that object to further development on the 'Ewa Plain, it might be preferable for development to occur elsewhere on O'ahu, such as in the Primary Urban Center, East Honolulu, Central O'ahu, North Shore, Ko'olau Loa, Ko'olau Poko and Wai'anae districts.

The potential benefit of this alternative is that while remaining under cultivation, the site would provide open space. Implementation of this alternative will avoid: infrastructure impacts (solid waste, wastewater and additional stormwater runoff generated on site); visual impacts (appearance of the site changing from agricultural fields to a master-planned urban development); the loss of agricultural employment; traffic impacts; and construction-related impacts (such as construction noise, construction equipment exhaust emissions, temporary traffic disruption, fugitive dust and soil erosion). Occasionally, however, continued cultivation, harvesting and plowing of the site will expose soils to the erosional forces of wind and rainfall.

6.3 ALTERNATIVES RELATED TO DIFFERENT DESIGNS OR DETAILS OF THE PROPOSED ACTIONS WHICH WOULD PRESENT DIFFERENT ENVIRONMENTAL IMPACTS

Different designs could be applied to the project, and depending on the density and design capacity, would result in different environmental impacts. For example, a higher density project that kept the same residential unit count as proposed (11,750) would reduce the buildable area (a positive benefit) and possibly reduce the quantity of surface runoff (a positive benefit). ~~This~~ Another potential benefit of this alternative is that it would likely be easier to serve by bus and correspondingly increase ridership. However,

AR00027510

the residential buildings would be larger and taller. This alternative would not allow as wide a range of residential products to market and was thus rejected. Implementation of this alternative will not avoid: infrastructure impacts (solid waste, wastewater and additional stormwater runoff generated on site); visual impacts (appearance of the site changing from agricultural fields to a master-planned urban development); the loss of agricultural employment; traffic impacts; and construction-related impacts (such as construction noise, construction equipment exhaust emissions, temporary traffic disruption, fugitive dust and soil erosion).

Another alternative would be to set aside less open space and to spread out the community over a larger land area. Such an alternative is best portrayed by the current Kapolei Long Range Master Plan and Ewa Development Plan Land Use Map designations for the Petition Area. This alternative would reduce the density (to some, a positive benefit) but consume more land, increasing the quantity of surface runoff, and requiring a much larger investment in grading and infrastructure. This alternative would make it difficult for residents to be served by bus, and even more difficult by high-capacity transit. Implementation of this alternative will not avoid: infrastructure impacts (solid waste, wastewater and additional stormwater runoff generated on site); visual impacts (appearance of the site changing from agricultural fields to a master-planned urban development); the loss of agricultural employment; traffic impacts; and construction-related impacts (such as construction noise, construction equipment exhaust emissions, temporary traffic disruption, fugitive dust and soil erosion). This alternative was also rejected.

The demand for safe drinking water and the quantities of wastewater, solid waste, and traffic generated would vary with different designs, depending on the number/quantity of residential units, schools, commercial square footage, and roads.

6.4 ACTIONS OF A SIGNIFICANTLY DIFFERENT NATURE WHICH WOULD PROVIDE SIMILAR BENEFITS WITH DIFFERENT ENVIRONMENTAL IMPACTS

One scenario that would be significantly different from the proposed action is that an elevated rail line and accompanying transit stops would not be built through Ho'opili. Implementation of this alternative will not avoid: infrastructure impacts (solid waste, wastewater and additional stormwater runoff generated on site); visual impacts (appearance of the site changing from agricultural fields to a master-planned urban development); the loss of agricultural employment; traffic impacts (assume greater traffic impacts than without the HHCTC project); and construction-related impacts (such as construction noise, construction equipment exhaust emissions, temporary traffic disruption, fugitive dust and soil erosion). The impacts of this scenario will be better described in the upcoming HHCTC DEIS.

For the 'Ewa district drivers enduring the longest morning commutes to the Central Business District or UH Mānoa, the modes of transportation will continue to be limited to: private motorized vehicle (including zipper lane), TheBus, TheBoat, Vanpool, et cetera. While this is a scenario that could inevitably result in lengthening commute

times, individual commuters will either: bear with the commute in return for the comfortable lifestyles offered by their homes in 'Ewa; move from their homes in 'Ewa and move closer to their workplaces or schools; or find schools and/or employment in the 'Ewa region. The opening of UHWO will reduce traffic from those undergraduate students in Leeward and Central O'ahu who commute to UH Mānoa, and indirectly reduce the demand for student housing on the UH Mānoa campus (reducing the demand for off-street parking demand on campus, reducing the demand for on-street parking in the surrounding neighborhoods, increasing the supply of student housing on campus, and reducing the demand for student housing off-campus). If the Petitioner is allowed to develop a mixed-use (residential/commercial/office/light industrial) project as proposed, then, more employment opportunities will be provided to existing residents of the region, reducing the need for some 'Ewa residents to commute outside of the District to work. To offset the non-implementation of the HHCTC project, the City and County of Honolulu may decide to increase The Bus and The Boat services. The positive benefits of this alternative is that the visual impact impacts of an elevated rail system would be avoided as well as long-term commitment of State and Federal funds for the HHCTC project. This alternative is not desirable, but feasible.

6.5 THE ALTERNATIVE OF POSTPONING ACTION PENDING FURTHER STUDY

Development of the 'Ewa region as O'ahu's Second City has been studied and planned for many years. Further study of any proposed development on the property would only be delaying what has long been proposed in the Ewa Development Plan. Therefore, this alternative was rejected, as it would not achieve the overall objectives for the project, which would create a mixed-use community that more employment opportunities will be provided to existing residents of the region, reducing the need for some 'Ewa residents to commute outside of the District to work. The potential benefit of this alternative is that while remaining under cultivation, the site would provide open space. Occasionally, however, continued cultivation of the site would generate dust when portions of the site are harvested and plowed. Implementation of this alternative will temporarily avoid: infrastructure impacts (solid waste, wastewater and additional stormwater runoff generated on site); visual impacts (appearance of the site changing from agricultural fields to a master-planned urban development); the loss of agricultural employment; traffic impacts; and construction-related impacts (such as construction noise, construction equipment exhaust emissions, temporary traffic disruption, fugitive dust and soil erosion). Occasionally, however, continued cultivation, harvesting and plowing of the site will expose soils to the erosional forces of wind and rainfall.

Ms. Patopan's Comment: I hope there are many more government reviews to evaluate this project if it remains in its current form. In addition to the added City processed I mention in this letter, I feel an intervention with the Land Use Commission is necessary to downsize this project and to make sure that someone identifies that the County is currently setting the stage for development by identifying transit stops before the Commission has had a chance to deliberate.

AR00027511

Response: We acknowledge your concerns. Please be assured that there will be many more governmental reviews including the State Land Use District Boundary Amendment process and rezoning. You will have many opportunities to voice your concerns before the Land Use Commission, Planning Commission and City Council.

Thank you again for your participation in the Environmental Impact Statement process for this project. Your comment letter and this response will be included in the Final Environmental Impact Statement. If you have any questions regarding this project, please do not hesitate to contact me at 521-5631.

Sincerely,

PBR HAWAII

Subject A06-771 - Ho'opili

Reference: A06-771, D. R. Horton - Schuler Homes, LLC, a Delaware limited liability company, d.b.a. D. R. Horton - Schuler Division.

I want to protest the granting of the Petition for Land Use District Boundary Amendment (from agricultural land use district to urban land use district) by Horton-Schuler Division.

The reason for this objection is that the transportation infrastructure is inadequate, and the additional traffic generated by the Ho'opili subdivision will clog up the current highway system (which already is operating at more than full capacity during the rush hours). The implementation of the *Honolulu High-Capacity Travel Corridor Project* is still in the developmental stage, with the City Council still generating a lot of waha nui about it. Even if the City Council should make a decision soon, the first segment, "the train to nowhere" (Kapolei to Pearl City), is not expected to be completed until 2012. Given the normal extended time for construction here, it would probably not take place until 2013 or 2014. The full project, to downtown Honolulu and the University of Hawai'i at Manoa (UHM), would, at the earliest, be completed in 2019, and more likely than not, be delayed at least a couple of years.

A developer normally develops all of the infrastructure (i.e., streets, sewage, utilities; land for schools and parks, and sometimes, even partial funding for them) within the subdivision, as demonstrated by the major developers (Gentry and Haseko) in the 'Ewa plain. However, the infrastructure outside the projects is the responsibility of the City & County and the State, and these governmental entities have not demonstrated their ability to provide them in a timely manner

.

A prime example of this is the North-South Road, from 'Ewa Beach to H-1. When we returned home in 1992 after an absence of a quarter century (we did come home every couple of years, however, since I taught at the UHM summer session), the State was still working on Kalaniana'ole Highway to East Honolulu (but that is an example on the other side of Honolulu proper). When we purchased our townhouse in 'Ewa by Gentry, there was a lot of wala'au about the North-South Road, and expectations

AR00027512

ORIGINAL

that it would be completed immediately. Eighteen years later, this is till a myth. I got somewhat involved in community activities, with a three year term on the Board of the 'Ewa by Gentry Community Association (Vice President, 1993-95; President, 1995-96), as well as on the Board of our condominium, and co-spokesperson on the first 'Ewa-Makakilo Vision Team. While the two developers completed their portions of the North-South Road, the State has still not fulfilled its bargain! It also took the S tate & City almost ten years to change the traffic light synchronization on Fort Weaver Road from stopping at each intersection, to being able to move without stopping at each light. Now there is so much traffic that the cars move at a snail pace and stop at every light anyhow.

Need I say more? Do you really want to clog up H-1? Should we be reactive or proactive?

I can speak now, detached, because we have moved from the 'Ewa plain to Kane'ohe, where there are three highways to the leeward side of the Ko'olau, and where the commuting time has been reduced by more than 50%.

We need agricultural land close to the market. The current area is very productive, and the availability of similar land is not available with the urbanization of the island of O' ahu. The argument that because the parcels are surrounded by Urban Districts, we should abandon agriculture and have more subdivisions? Especially with the slowdown of the real estate market, the petitioner's proposals do not make any sense. The designation of different use districts was designed to prevent problems from occurring. Changing them at this time would not be wise.

I would respectfully request the Land Use Commission to deny the proposed Ho'opili petition.

Aloha,
Al Keali'i Chock

SUBJECT: HO'OPILI DRAFT ENVIRONMENTAL IMPACT STATEMENT

Dear Mr. Chock:

We are in receipt of your email dated April 3, 2008 to Mr. Rodney Maile of the Land Use Commission. We have reviewed your email and provide the following responses:

Transportation

Mr. Chock's Comment: "I want to protest the granting of the Petition for Land Use District Boundary Amendment (from agricultural land use district to urban land use district) by Horton-Schuler Division. The reason for this objection is that the transportation infrastructure is inadequate, and the additional traffic generated by the Ho'opili subdivision will clog up the current highway system (which already is operating at more than full capacity during the rush hours). The implementation of the *Honolulu High-Capacity Travel Corridor Project* is still in the developmental stage, with the City Council still generating a lot of waha nui about it. Even if the City Council should make a decision soon, the first segment, "the train to nowhere" (Kapolei to Pearl City), is not expected to be completed until 2012. Given the normal extended time for construction here, it would probably not take place until 2013 or 2014. The full project, to downtown Honolulu and the University of Hawai'i at Manoa (UHM), would, at the earliest, be completed in 2019, and more likely than not, be delayed at least a couple of years."

Response: We acknowledge that the construction of the project will generate additional traffic in the 'Ewa region. However, full development of the project is expected to occur around 2030, which provides for an adequate amount of time for the Honolulu High-Capacity Transit Corridor to be constructed. The development of the HHCTC within the Ho'opili project site would reduce the number of vehicle-trips generated by the project. The project in itself is designed to offer daily live, work, play, learning and shopping opportunities, reducing the need for residents to use H-1 Freeway and Fort Weaver Road. Coupled with that, the Second City of Kapolei is rapidly maturing and providing its own work and shopping opportunities. With UHWO being developed next door, Ho'opili residents who would have normally commuted to UH Manoa for their undergraduate degree will no longer have to do so.

Infrastructure

Mr. Chock's Comment: "A developer normally develops all of the infrastructure (i.e., streets, sewage, utilities; land for schools and parks, and sometimes, even partial funding for them) within the subdivision, as demonstrated by the major developers (Gentry and Haseko) in the 'Ewa plain. However, the infrastructure outside the projects is the responsibility of the City & County and the State, and these governmental entities have not demonstrated their ability to provide them in a timely manner.

A prime example of this is the North-South Road, from 'Ewa Beach to H-1. When we returned home in 1992 after an absence of a quarter century (we did come home every couple of years, however, since I taught at the UHM summer session), the State was still working on Kalaniana'ole Highway to East Honolulu (but that is an example oh the other side of Honolulu proper). When we purchased our townhouse in 'Ewa by Gentry, there was a lot of wala'au about the North-South Road, and expectations that it would be completed immediately. Eighteen years later, this is till a myth. I got somewhat involved in community activities, with a three year term on the Board of the 'Ewa by Gentry Community Association (Vice President, 1993-95; President, 1995-96), as well as on the Board of our condominium, and co-spokesperson on the first 'Ewa-Makakilo Vision Team. While the two developers completed their portions of the North-South Road, the State has still not fulfilled its bargain! It also took the State & City almost ten years to change the traffic light synchronization on Fort Weaver Road from stopping at each intersection, to being able to move without stopping at each light. Now there is so much traffic that the cars move at a snail pace and stop at every light anyhow.

Need I say more? Do you really want to clog up H-1? Should we be reactive or proactive?

I can speak now, detached, because we have moved from the 'Ewa plain to Kane'ohe, where there are three highways to the leeward side of the Ko'olau, and where the commuting time has been reduced by more than 50%."

Response: We acknowledge your concern that the infrastructure outside of the Ho'opili project is the responsibility of the City & County of Honolulu and the State of Hawai'i, and your assessment that these governmental entities have not demonstrated their ability to provide them in a timely manner. Please note that the Petitioner is coordinating with various City and State agencies and surrounding developers (such as DHHL and UHWO) so that on-site and off-site infrastructure facility improvements can be better timed with Ho'opili's development. In addition, Ho'opili will contribute to the Ewa Highway Transportation Master Plan Impact Fee program, supporting development of local roadways and easing impacts on the existing arterials.

Agriculture

Mr. Chock's Comment: "We need agricultural land close to the market. The current area is very productive, and the availability of similar land is not available with the urbanization of the island of O'ahu. The argument that because the parcels are surrounded by Urban Districts, we should abandon agriculture and have more subdivisions? Especially with the slowdown of the

real estate market, the petitioner's proposals do not make any sense. The designation of different use districts was designed to prevent problems from occurring. Changing them at this time would not be wise."

Response: We acknowledge your comments regarding agricultural lands on the island of O'ahu. However, the reality is that of the 43,400 acres that are were rated A and B on the State Geographical Information System layer in 1995, 41,750 acres or 96% are still available for agricultural use. The project site has been long planned by the Ewa Development Plan and Kapolei Long Range Master Plan as an area for new development. In addition, the Hawaii Housing Finance Development Corporation, University of Hawai'i - West O'ahu (UHWO), the State Department of Transportation, and the Department of Hawaiian Home Lands have all developed former agricultural lands immediately adjacent to the proposed Ho'opili project into the Villages of Kapolei, UHWO Campus, the North-South Road and the Department of Hawaiian Home Lands East Kapolei developments. All of these developments fall within the urban growth boundary.

Over the years, a number of communities developed in the 'Ewa region, including the 'Ewa Plantation Villages, the 'Ewa Beach community, and Barbers Point Naval Air Station (now known as Kalaeloa). In the 1960's, Makakilo City and the James Campbell Industrial Park were started based on an overall master plan for the area prepared by the Estate of James Campbell in the mid-1950's.

'Ewa is a key component of the City and County of Honolulu's directed growth policies. In 1974, Donald Wolbrink of Harland Bartholomew developed a visionary plan for Kapolei. After much public discussion, the decision to direct urban growth to the 'Ewa area became the official policy of the City and County of Honolulu. In 1977, the Honolulu City Council approved a new General Plan that designated 'Ewa as the location for a Secondary Urban Center for O'ahu. The Secondary Urban Center was to be the focus of major economic activity, housing development, and a center for government services, while preserving areas such as Wai'anae and the North Shore for rural uses.

In August 1977, the State Land Use Commission (SLUC) approved the first State Land Use District Boundary Amendment (SLUDBA) in 'Ewa. This SLUDBA permitted the development of West Beach (now referred to as Ko 'Olina). Subsequent to the Ko 'Olina approval, both the State and the City and County of Honolulu filed at least four petitions with the SLUC to amend the State Land Use Districts in 'Ewa from Agricultural to Urban. In all of the petitions, the General Plan designation of 'Ewa as the Secondary Urban Center was cited as proof that "urbanization" of 'Ewa was consistent with the City and County of Honolulu's planning policy. Similarly, when the Honolulu City Council adopted the Ewa Development Plan (DP) in 1997, petitioners cited both the General Plan and the Ewa DP for their respective project's consistency with the City and County of Honolulu's directed growth policy.

In nearly all of the State and City and County of Honolulu SLUDBA's, soils were rated at or near the top of agricultural productivity rating systems: "A" or "B" by the Land Study Bureau (LSB), and "Prime" under the agricultural lands of importance to the State of Hawaii (ALISH) system. For example, the largest SLUDBA involved 1,300 acres of land adjoining Ho'opili in SLUC Docket No. A99-728, also referred to as the Housing and Community Development

AR00027514

Corporation of Hawaii (HCDCH) East Kapolei. Ninety-seven percent of the soils in HCDCH East Kapolei were rated "A" or "B" by the LSB, and nearly all of the 1,300 acres were rated "Prime" under ALISH. HCDCH East Kapolei is now under or proposed for development by the University of Hawai'i West O'ahu, the Department of Hawaiian Home Lands, the State Department of Transportation (North-South Road), the proposed Salvation Army Kroc Center, and the State Department of Land and Natural Resources.

Additionally, the State appears to maintain its commitment toward growing the Second City in Kapolei by its construction of State office building, and a planned new judiciary complex on former agricultural lands. Finally, during the public review period, the State Department of Land and Natural Resources (DLNR), Engineering Division wrote: "DLNR currently owns approximately 183 acres of land near and/or adjacent to the Ho'opili project...The DLNR parcels have excellent development potential based on the location of these lands adjacent to or near major arteries (H-1 Freeway, Farrington Highway, North-South Road) and the City's proposed transit line as well as the substantial increase development projects in the area." In summary, while we understand your concerns regarding agricultural lands, the project remains consistent with long-standing planning policies that have taken into consideration the potential loss of agricultural land to the state.

Thank you again for your participation in the Environmental Impact Statement process for this project. Your comment letter and this response will be included in the Final Environmental Impact Statement. If you have any questions regarding this project, please do not hesitate to contact me at 521-5631.

Sincerely,

PBR HAWAII

SUBJECT: HO'OPILI DRAFT ENVIRONMENTAL IMPACT STATEMENT

Dear Ms. Perry:

We are in receipt of your email dated April 5, 2008 to Mr. Rodney Maile of the Land Use Commission. We have reviewed your email and provide the following responses:

1. All tenants are aware of and have been kept informed about the urbanization plans for the property. At the time leases with the tenants were executed, these disclosures were made. In consideration for the tenants' eventual need to relocate, the Petitioner has made efforts to assist them in the short-term by keeping lease costs for the land and water at or below market rates. This consideration is also mentioned on Page 30 of the Draft EIS.

   The Petitioner remains committed to working on the relocation of its larger tenant, including Aloun Farm, Inc., consistent with its statement on Page 30 of the Draft EIS. However, to date, no site has been secured for that purpose.

2. While there are no plans to develop waste to energy technologies on the project site, recycling shall be encouraged within the project including the reuse and recycling of green waste generated during construction clearing and grubbing activities, the use of recycled construction and demolition wastes and the use of materials made from recycled products, the use of locally produced compost as available for landscaping, and the provision of space for recycling bins in the detailed design of the community. These mitigation measures were described on pages 92 and 93 of the Draft EIS. As noted on page 95 of the Draft EIS, the City and County of Honolulu has plans to expand the H-POWER refuse-to-energy plant by adding a third boiler at the facility.

3. The Petitioner lauds Habitat for Humanity – Leeward in its attempt to construct 3,600 self-help homes, however, there are no plans to incorporate these homes as part of the project. Please note that up to 30 percent of the total number of units for the Ho'opili project is expected to be developed as affordable housing units to comply with the City and County of Honolulu's affordable housing guidelines.

AR00027516

Thank you again for your participation in the Environmental Impact Statement process for this project. Your comment letter and this response will be included in the Final Environmental Impact Statement. If you have any questions regarding this project, please do not hesitate to contact me at 521-5631.

Importance: High

Dean,

In my review of the Ho'opili E.I.S., there is some conflicting information that I want to point out. Whether this will lead to a formal comment, I would like your response and discussion on would be appropriate.

The portion that reference to the economic impact of the farm business is incorrect (top of page #31). The numbers are significant far off that I believe it is appropriate to point out.

The figure of $6m is probably half as our entity exceed that and not to account for Fat Law/Jeff's winter tomato crop/and all the corn seed that contract grow on the plains. The job impact of 80 full time is also grossly under stated. While is would be alright to under gross the $$ generated, but the number of people under stated will surely come up as you take this through the Land Use Commission. AF alone, have always exceeded 130 full time. We have floated between 130 and 165 position. We've been on the low side in 2006 and '07 due to losing staff to housing/landscaping/and now Monsanto pull. We've made it up in lots of over time and part-timers. Outlook for 2008 is that we'll increase back up close to the optimal of 165 full time company. Again, there is still the corn seed/Sugarland/and Fat Law entity that employs.

I am on a short notice leave this week; here in Japan to introduce our Ewa Sweet Onion. I'll be checking emails and do have an emergency number, cel 81-80-67609027. Will be at this number the next 24 hrs.

Thanks.

SUBJECT: HO'OPILI DRAFT ENVIRONMENTAL IMPACT STATEMENT

Dear Mr. Sou:

Thank you for your email dated April 1, 2008. We have reviewed your email and offer the following response to your comments.

> *The portion that reference to the economic impact of the farm business is incorrect (top of page #31). The numbers are significnnt far off that I believe it is appropriate to point out.*
>
> *The figure of $6m is probably half as our entity exceed that and not to account for Fat Law/Jeff's winter tomato crop/and all the corn seed that contract grow on the plains. The job impact of 80 full time is also grossly under stated. While is would be alright to under gross the $$ generated, but the number of people under stated will surely come up as you take this through the Land Use Commission. AF alone, have always exceeded 130 full time. We have floated between 130 and 165 position. We've been on the low side in 2006 and '07 due to losing staff to housing/landscaping/and now Monsanto pull. We've made it up in lots of over time and part-timers. Outlook for 2008 is that we'll increase back up close to the optimal of 165 full time company. Again, there is still the corn seed/Sugarland/and Fat Law entity that employs.*

We greatly appreciate the information provided. According to our consultant, Bruce Plasch of Decision Analysts, Inc., his agricultural impact assessment is based in part, on interviews with existing tenants, many of who are farming in areas outside of the Petition Area as well. According to Mr. Plasch, he interviewed you on two separate occasions.

Regarding the specific number of jobs and revenue generated, Mr. Plasch's numbers were based only on the portion of Aloun Farms within the Petition Area. Please see Table 2, *Economic Activity Generated by Agricultural Operations in the Petition Area: 2007*, and Table 4, *Projected Economic Activity Generated by Agricultural Operations in the Petition Area: 2010*, as show in Appendix A, *Agricultural Impact Analysis*, of the Draft EIS.

Thank you again for your participation in the Environmental Impact Statement process for this project. Your comment letter and this response will be included in the Final Environmental Impact Statement. If you have any questions regarding this project, please do not hesitate to contact me at 521-5631.

Sincerely,

AR00027524

EXECUTIVE SUMMARY

1. PROPOSED DEVELOPMENT

D.R. Horton—Schuler Homes, LLC (dba D.R. Horton—Schuler Division) proposes to develop Ho'opili ("the Project"), a planned community to be located on 1,555.145 acres in the 'Ewa District, O'ahu. This area includes 1,553.844 acres that is referred to as the "Petition Area," plus another 1.301 acres in the State Urban District. Off-site drinking-water reservoirs and storm-water detention areas will add 45.120 acres, resulting in a total Project Area of 1,600.265 acres. The Project will include about 11,750 single- and multi-family homes; business and commercial space; light-industrial space; parks and open space; public facilities; and associated infrastructure.

The Petition Area—which is surrounded by a combination of existing and planned urban development on three sides and the H-1 Freeway on the fourth side—is designated for residential and related development in the County's 'Ewa Development Plan and is within the Urban Growth Boundary. The Project will require a State Land Use District Boundary Amendment to Urban, and a change in County zoning.

2. AGRICULTURAL CONDITIONS

Existing agricultural leases indicate that about 1,375 acres (88%) of the Petition Area are arable land. Soil ratings indicate that about 1,340 ± 65 acres of the Petition Area have favorable agronomic conditions for crop production. This area has high-quality soils, flat or gently sloping terrain, high solar radiation, low pumping costs for irrigation water, and good access. Because of the sunny conditions, the fields are well-suited for growing crops during the Winter months.

3. LOCATIONAL ADVANTAGES AND DISADVANTAGES FOR CROP PRODUCTION

The Petition Area is well-located for serving the Honolulu consumer market and export markets. This is due to the short trucking distance to the Honolulu markets, the Honolulu International Airport, and Honolulu Harbor.

4. LOCATION AND SURROUNDING LAND USES

The Project is *makai* of the H-1 Freeway, *mauka* of 'Ewa Villages, west of Fort Weaver Road and Old Fort Weaver Road, and east of other planned projects in East Kapolei (Figures 1 and 6). These planned projects include: the University of Hawai'i West O'ahu (UHWO) campus and related residential and commercial development, Department of Hawaiian Home Lands (DHHL) East Kapolei residential projects, DHHL commercial center, and the Kroc Community Center on DHHL land.

Urban development has occurred or will occur to the east, south and west of the Petition Area. To the north on the *mauka* side of the H-1 Freeway are agricultural fields in Kunia and grazing lands in the Kunia foothills.

5. EXISTING AGRICULTURAL OPERATIONS

Currently, four agricultural operations lease or sublease about 1,497 acres (96%) of the Petition Area:

- Aloun Farms, Inc.: about 1,100 acres, of which about 100 acres are subleased to Fat Law's Farm

  In total, Aloun Farms and its affiliate lease about 2,440 acres in 'Ewa, Kunia, and Central O'ahu. Three acres within the Petition Area are used for Aloun's primary operating facilities.

- Fat Law's Farm: about 100 acres subleased from Aloun Farms

  This is the entire acreage for this operation, but the company also markets produce grown elsewhere by other farmers.

- Sugarland Farms, Inc. ("Jefts Farm"): about 197 acres

  In total, the consultant estimates that Jefts Farms owns or leases over 5,000 acres in 'Ewa, Kunia, the North Shore of O'ahu, and Moloka'i.

- Syngenta Seeds, Inc.: about 200 acres

  In total, Syngenta leases and subleases about 740 acres in 'Ewa and Kunia, and about 3,000 acres on Kaua'i.

AR00027525

6. DIRECT ON-SITE AGRICULTURAL IMPACTS

Ho'opili will result in the gradual loss of about 1,497 acres currently being leased for various agricultural operations. In isolation, and allowing for the replacement of Syngenta by another agricultural operation (see Section 8), this gradual loss of agricultural land will result in a related gradual loss of the following: approximately $6 million per year in revenues, average employment of about 80 jobs, and about $1.7 million per year in payroll.

In practice, however, most or all of the agricultural operations on the Ho'opili land are expected to relocate to other lands. In view of these anticipated relocations, mitigating measures are discussed at the end of the Section 10 which addresses cumulative impacts.

7. CUMULATIVE LOSS OF LAND FOR THE AFFECTED AGRICULTURAL OPERATIONS

In addition to the leased and subleased lands that gradually will be lost as the Project is developed over a 20-year period, three of the four agricultural operations in the Petition Area will eventually lose agricultural lands to (1) other private and State urban projects in 'Ewa and Central O'ahu that are within the County's Urban Growth Boundary, and (2) other agricultural operations in Kunia. For the affected agricultural operations, the approximate cumulative reductions in agricultural land will total about 3,600 acres (see Table ES-1). Syngenta's and Jefts Farms' losses of acreage to Monsanto (another agricultural operation) may occur within a few years. The agricultural land lost to urban projects is likely to begin in a few years and continue until as late as 2030.

By 2030, the acreage losses shown in Table ES-1 will leave Aloun Farms with about 160 acres of their current leased land, Fat Law's Farm with none of their current subleased land, and Syngenta with none of their leased acreage on O'ahu although some of their subleased acreage will remain available. Although reduced in size, Jefts Farms will retain over 4,000 acres of their current agricultural land.

8. CHANGES TO AGRICULTURAL OPERATIONS BEFORE HO'OPILI IS DEVELOPED

Monsanto's 2007 land purchase in lower Kunia includes the core of Syngenta's operations on O'ahu. Because of this purchase, the consultant anticipates that Syngenta will relocate from Kunia to some other area within the next few years—with or without Ho'opili, and before Ho'opili construction even begins.

Table ES-1. Cumulative Loss of Land for the Affected Agricultural Operations
(approximate acreage estimates by DAHI)

	Aloun Farms	Fat Law's Farm	Jefts Farms	Syngenta	TOTAL
Urban Projects					
Ho'opili, 'Ewa	1,000	100	197	200	1,497
State Projects, 'Ewa[1]	850	-	95	-	945
Koa Ridge, Central O'ahu	430	-	-	-	430
Agricultural Uses					
State Ag Park, Kunia	-	-	150	-	150
Monsanto Co., Kunia	-	-	220	360	580
Total	2,280	100	662	560	3,602

1. UHWO, DHHL and other State projects.

Source: Decision Analysts Hawai'i, Inc.

Syngenta could relocate to Kaua'i where they already lease about 3,000 acres, although the North Shore of O'ahu is a possibility. If the company relocates to Kaua'i, the economic activity for Syngenta's O'ahu operation would be transferred to Kaua'i. This would include about a dozen full-time workers, 15 to 20 part-time workers, and about 60 to 90 temporary workers during the peak Winter season.

After Syngenta vacates the 200 acres it now leases in the Petition Area, it is expected that the land will be leased short-term to another agricultural operation until construction of this site is ready to begin.

9. AVAILABILITY OF REPLACEMENT LAND

The impact of the cumulative loss of land on the affected agricultural operations will depend on the amount and quality of available replacement land Statewide and on O'ahu.

AR00027526

a. Statewide

Statewide, a vast amount of land has been released from plantation agriculture: about 251,800 acres between 1968 and 2005, resulting in an average release of over 6,800 acres per year over a 37-year period (see Figure ES-1). The 2006 Del Monte closure in Kunia increased this figure by another 4,400 acres, resulting in a total release of at least 256,200 acres from plantation agriculture between 1968 and 2007. Over the 1968-to-2005 period, the demand for land for diversified crops increased by about 26,300 acres (about 10% of the land released from plantation agriculture).

The acreage released from plantation agriculture has far outpaced the demand for land for diversified crops. The net decrease in diversified crop land amounts to about 229,900 acres. While some of this land has been converted or is scheduled to be converted to urban uses and tree plantations, an estimated 160,000+ acres remain available for diversified crops.

If the Hawai'i Superferry is successful, cultivating crops on the Neighbor Islands for the Honolulu market, and vice versa, may become more economically feasible.

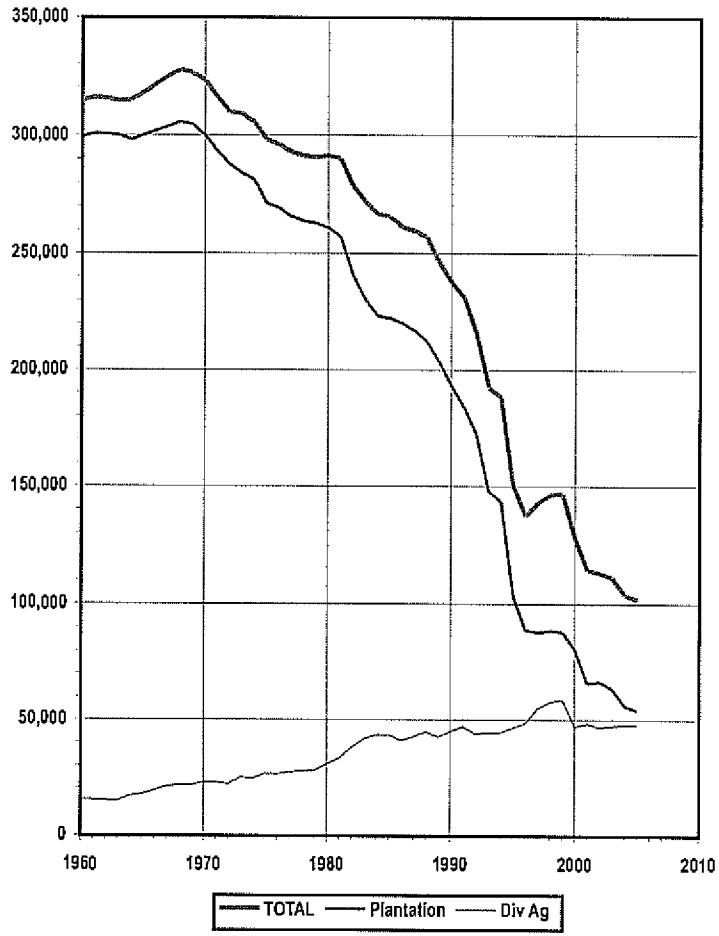
The above information indicates that considerable land is available in Hawai'i to accommodate the relocation of agricultural operations as well as the growth of diversified crop farming.

b. O'ahu

On O'ahu, a similar release of plantation land occurred. In total, about 10,900 acres of former plantation land remain available for other crops, including about 3,150 acres of former pineapple land in Kunia plus about 7,750 acres of former sugarcane and pineapple lands on the North Shore.

However, much of the available 10,900 acres have limitations for growing certain crops. Some limitations reflect permanent agronomic conditions. For example, the higher elevation fields in Kunia and on the North Shore have less solar radiation compared to 'Ewa. Nevertheless, some limitations can be overcome with investment in improvements. For example, on the North Shore, portions of the water delivery systems need major repairs, and the types of crops on fields irrigated with water from Wahiawa Reservoir (Lake Wilson) will be restricted as long as partially-treated wastewater continues to be discharged into the lake.

Figure ES-1 - Statewide Acreage in Crop: 1960 to 2005



AR00027527

10. CUMULATIVE AGRICULTURAL IMPACTS

a. Loss of Land for the Affected Agricultural Operations

As summarized in Table ES-1, the Project will result in a direct loss of about 1,497 acres currently being leased for various agricultural operations. In combination with land lost to other State and private urban projects and to other agricultural uses, the four agricultural operations in the Petition Area will incur a cumulative loss of about 3,600 acres of their leased land. As noted above, it is expected that Syngenta will relocate for reasons unrelated to and before the Ho'opili construction begins.

b. Required Replacement Land

If Syngenta remains on O'ahu, then about 3,600 acres of replacement land will be needed on O'ahu by the four the affected agricultural operations. But, if Syngenta relocates its O'ahu activities to Kaua'i where most of its operations are located, then the O'ahu demand will be reduced to less than 2,900 acres of replacement land.

As summarized in the previous section, sufficient land is available on O'ahu and the Neighbor Islands. Nevertheless, major water-related improvements are required before all available agricultural lands on the North Shore of O'ahu will be suitable for growing diversified crops. Also, the available lands possess different agronomic conditions than those found in 'Ewa and lower Kunia.

c. Anticipated Changes in Agricultural Operations

Until 2030, the agricultural operations located in the Petition Area are likely to adjust to gradual acreage losses by implementing a combination of (1) leasing replacement lands, (2) possibly cultivating remaining lands more intensively, and/or (3) reducing their operations. By 2030, however, Aloun Farms will lose nearly all and Fat Law's Farm will lose all their leased lands, thereby necessitating relocation to Kunia and/or the North Shore.

Assuming that the affected lessees secure replacement lands, and assuming the necessary water improvements are made, then the affected agricultural operations could maintain about the same level of production, sales revenues, employment and payroll. However, major adjustments in their operations will be required since the replacement lands will have different agronomic conditions. Also, the lessees will incur additional expenses to prepare the soils and irrigation systems for their particular crops, and to move their offices, and cooling and packing facilities.

If sufficient replacement land is not available on O'ahu (due to the unlikely possibility that it will be used to grow an energy crop), then one or more of the agricultural operations could turn to a Neighbor Island. Potential feasibility is illustrated by the fact that two of the lessees already have agricultural operations on Neighbor Islands, while many Neighbor Islands growers supply O'ahu markets. However, the affected companies which may move to the Neighbor Islands will incur higher transportation costs, and delivery times will be longer. The costs and delays will be similar to those that Neighbor Island farmers now incur to supply the Honolulu market. In the future, these costs and delays may be somewhat lower because of the Superferry and the planned improvements to interisland barge service. The disadvantages of a Neighbor Island location could be partially offset by lower rents. However, for some perishable crops, the ferry service may not be sufficiently frequent or travel may take too long.

d. Flexibility of Affected Agricultural Operations to Resize

Since the affected diversified crop operations can be flexible with regard to their sizes, it is anticipated that they will survive regardless of the amount of replacement land they lease in the future. More to the point, changes in available agricultural land due to the Project are not likely to threaten the survival of Aloun Farms, Fat Law's Farm, or Jefts Farms.

e. Statewide Impacts

From a Statewide perspective, the cumulative agricultural impact of the Project will be modest regardless of how the affected agricultural operations adjust to losing all, or portions of, their leased acreage. Their lost agricultural production from the Petition Area and from other areas they now lease will be offset largely by (1) maintaining their current levels of operation and production by leasing replacement lands in Kunia and/or the North Shore, and possibly cultivating their remaining lands more intensively; (2) one or more of them relocating all or portions of their operations to a Neighbor Island; (3) other farmers on O'ahu and the Neighbor Islands increasing their production; or (4) some combination of the three.

Thus, it is likely that there will be little or no loss in Statewide agricultural production, revenues, employment or payroll.

AR00027528

f. **Urbanization of Agricultural Lands**

Reconfigurations of farms such a those described above are common and appropriate when agricultural operations lease land in the path of planned urban expansion. For the affected operations, much of the land they lease is located in areas that the County and, for much of the 'Ewa Plain, the State have designated for eventual expansion of Kapolei. Also, all current tenants entered into lease agreements with this knowledge and, except for Fat Law's Farm, have benefited from rents that are now below market.

For diversified crop farmers who supply nearby markets, locations on the edge of town can be ideal for them because of the lower trucking costs. And until these lands are urbanized, the best "temporary" use of them may be agriculture—a use that may last decades. For example, the affected operations have cultivated their acreage on the 'Ewa Plain for 10 years or more, and some of this land will probably remain available to them for agriculture until as late as 2030.

But when urbanization does occur, the operations will incur the expense and disruption of relocating all their operations or major portions of them to other lands. Since lessees only have temporary rights to the land, the costs of relocating falls on the farmers and are not an obligation of the landowners. If the costs were an obligation of the landowners, they would avoid leasing their land to crop farmers and put their land in a lower value agricultural use such as cattle grazing which has similar land-management and property-tax benefits.

g. **Mitigating Measures**

The mitigation measures recommended below will contribute to the successful relocation of the four agricultural operations that will be displaced by Ho'opili in combination with other land-use changes in 'Ewa, lower Kunia and Central O'ahu. They are designed to (1) address water issues that limit crop production on the North Shore where most available farm lands on O'ahu are located, and (2) provide sufficient time to make the necessary improvements and arrangements for relocating. Some of the recommendations will also benefit other growers who may relocate to or expand on the North Shore.

The recommended mitigation measures are categorized by those which may be best implemented by government, and those which are within the purview of D.R. Horton:

— Government

- Upgrade the Wahiawa Wastewater Treatment Plant (WWTP) to treat wastewater to the State's R-1 standard, or eliminate discharging wastewater into the Wahiawa Reservoir.

This recommendation to the County is consistent with a 1998 Consent Decree with the U.S. Environmental Projection Agency (EPA). Its purpose is to allow farmers to use water from the Wahiawa Reservoir to irrigate any type of crop using any type of irrigation system.

Until the quality of the reservoir water is improved, most of the available agricultural land on the North Shore cannot be used to grow the types of vegetable crops the farmers grow in 'Ewa and lower Kunia. In turn, one or more agricultural operations that will be displaced by Ho'opili and by other projects may not be able to fully relocate to the North Shore until the improvements are made (assuming that relocating to the North Shore is their best option).

- Repair the Wahiawa Irrigation System (WIS)

Repairs to portions of the WIS are needed to address major and minor leaks and to prevent future leaks. Because of the leaks, a number of mid-level and high-level fields on the North Shore can no longer be irrigated in the summer months with water from Wahiawa Reservoir. Until these repairs are made and more fields can be irrigated reliably, one or more agricultural operations being displaced by Ho'opili and by other projects may not be able to fully relocate to the North Shore (assuming that relocating to the North Shore is their best option).

Because of the high cost of the repairs, State and Federal funds may be required.

— D.R. Horton

- To the extent possible, coordinate the development of Ho'opili with the affect agricultural operators and with developers of adjacent lands so as to maintain farming in 'Ewa for as long as possible.

The development of Ho'opili and of projects on adjacent State lands could continue until 2030. Until then, farming can continue in 'Ewa, provided that Ho'opili works with the agricultural operators and developers of adjacent land to: (1) maintain access to fields and irrigation water, and (2) phase development to minimize the potential for nuisance issues (discussed in the next section). This will allow more time for others to make the necessary improvements to the WWTP and the WIS.

AR00027529

• Continue to lease agricultural land at below-market rents.

The affected agricultural operators will have to make frequent adjustments to their operations as development proceeds. These adjustments may include contracting their 'Ewa operations, rearranging water systems, building berms to reduce nuisance problems, etc.

Continued below-market rents will allow the affected agricultural operators to retain more funds to help finance the required adjustments.

11. NUISANCE ISSUES

a. Potential for Nuisance Issues

Nuisances arising from agricultural operations can become an issue for both residents and farmers. Residents who live close to and downwind from agricultural operations may complain about occasional noise, dust, chemical spraying, etc. In turn, the farmers may have to change their operations in order to address these complaints.

Regarding the existing homes that are located downwind of the agricultural operations in the Petition Area, they are buffered from nuisance problems by (1) farming activities on State land, (2) fallow fields on State land, and (3) the Kapolei Golf Course.

However, nuisance issues could arise during the 20 or so years while agricultural operations continue in portions of the Petition Area and homes are built and occupied nearby as part of Ho'opili or other projects on adjacent State lands.

Once Ho'opili and adjacent lands are fully developed, nuisance issues arising from agricultural activities will not occur since the lands will no longer be cultivated.

b. Mitigating Measures

To mitigate potential nuisance issues related to agricultural activities near newly built homes, the following mitigation measures are recommended:

— To the extent possible—and subject to transit alignment, water and other infrastructure improvements—phase the development of homes and coordinate agricultural leases to provide wide separations between homes and upwind agricultural activities.

— For each phase of development of Ho'opili and nearby projects, require farmers to provide a buffer of fallow fields and berms upwind of the homes before the homes are occupied.

— As necessary, limit agricultural activities (restricted hours of operation, restricted plowing and use of chemicals on windy days, etc.) so as to avoid or minimize nuisance problems.

— As long as agricultural operations continue in the Petition Area and on adjacent lands, inform home buyers in the area that they will be living near agricultural activities.

12. GROWTH OF DIVERSIFIED CROPS

The Project will commit about 1,554 acres of agricultural land to a non-agricultural use, of which about 1,375 acres are arable. The impact of this commitment on the growth of diversified crops is addressed below.

a. Potential Acreage Requirements for Diversified Crops

Crops to Replace Imports of Fruits and Vegetables

For low-elevation fruits and vegetables that have a history of profitable production in Hawai'i, potential land requirements in 2010 for 100% import substitution for the Hawai'i and O'ahu markets are estimated at 12,700 acres and 8,600 acres, respectively, plus additional acreage for fallowing land between crop plantings. When allowing for competition from imports, these estimates drop to about half.

Since Hawai'i farmers already supply a portion of the Hawai'i market, land requirements for increased import substitution are a fraction of the above estimates.

Export Crops

The many entrepreneurial agricultural efforts being undertaken on former plantation lands may lead to one or more major new export crops over the next 20+ years. However, the history of agricultural efforts in Hawai'i reveals that developing major new export crops that are successful in overseas markets is difficult and infrequent. For example, over the past 50 years in Hawai'i, farmers have explored numerous possibilities for export crops, but they have developed overseas markets for just one diversified crop that requires more than 10,000 acres (macadamia nuts at 18,300 acres in 2005); one additional crop that requires more than 5,000 acres (coffee at 8,000 acres); and only five additional crops or crop categories that require more than 1,000 acres each.

AR00027530

At 4,220 acres in 2005 and growing at an average rate of 264 additional acres per year, the seed industry is expected to soon become only the third diversified crop that requires more than 5,000 acres. The fourth crop could be nursery and flower products: 3,895 acres and increasing at 235 acres per year.

Feed Crops

If feed crops could be grown in Hawai'i and priced competitively against mainland imports, they could replace some of the grains and hay that are now being imported to the State. Unfortunately, a number of commercial attempts in Hawai'i to grow grains and alfalfa have been unsuccessful.

Biofuel Crops

Crops can be grown to produce biomass to fuel a boiler, or as feedstock to produce fuels. In Hawai'i, the common practice has been to produce biomass as a by-product of some principal crop. However, a company plans to build an ethanol plant at Campbell Industrial Park using conventional technology but, at least initially, using imported molasses as the feedstock. For the longer term, this company is exploring the economics of growing sweet sorghum to supply feedstock to its ethanol plant. Acreage requirements for a new sorghum biofuel plantation on O'ahu would range from about 6,000 acres for viability to 15,000 acres if juice from sorghum were to replace all imported molasses. Also, two companies plan to build biodiesel refineries in Hawai'i: one on O'ahu and one on Maui. Both will use imported palm oil from Malaysia and other countries as their feed stock, but would refine locally produced vegetable oil if available.

However, a number of substantial difficulties must be overcome to develop one or more biofuel plantations. For example, it will be difficult to lease the large amount of land required for economic viability. Most major landowners will be reluctant to lease their land at comparatively low rents for the approximately 30-year period required to capitalize the investment. Also, per-acre returns from biofuel crops are comparatively low. In the long-term, emerging technology that is in the early stages of commercialization holds promise for a cheaper source of feedstock for ethanol. Instead of producing ethanol using sugars from conventional sources, the sugar would come from "cellulosic" sources. This would include green waste for which there would be no land rent and no growing costs, but there could be a disposal fee paid to the processor. In the long term, this less expensive source of feedstock could result in an unprofitable biofuel plantation.

These and other difficulties and risks suggest that the probability of successfully developing and sustaining a biofuel plantation in Hawai'i is low. The more likely scenario is that ethanol will be produced as a by-product of sugar and, over the long-term, it will be produced from green waste.

Recent Crop-Acreage Trends

For all diversified crops (i.e., all crops other than sugarcane and pineapple, including crops to replace imports and crops for export) Statewide land requirements grew as shown in Figure ES-1. As illustrated, growth in acreage has slowed over time, with an average growth of about 160 acres per year from 2000 to 2005. During this period, major export crops grew by an average of about 350 acres per year, while crops grown for the Hawai'i market declined by an average of about 190 acres per year.

b. Adjusted Supply of Land Available for the Growth of Diversified Crops

As discussed above, about 10,900 acres of farm land are available on O'ahu, and over 160,000 acres are available Statewide. Over time, a portion of this available land supply will be leased to the four agricultural operations that will have to relocated as a result of Ho'opili in combination with other land-use changes in 'Ewa, lower Kunia, and Central O'ahu. On O'ahu, this relocation will require about 2,900 to 3,600 acres, depending on whether Syngenta's O'ahu operation remains on O'ahu or relocates to Kaua'i. The adjusted supply of farm land that will remain available for diversified farming will total about 7,300 to 8,000 acres on O'ahu and over 156,000 acres Statewide.

This adjusted supply of available farm land far exceeds the amount of land that will be needed to accommodate the growth of diversified crops, whether demand is based on potential or recent trends. This indicates that the limiting factor to the growth of diversified crops will *not* be the *land supply*. Instead, growth will be limited by the *size of the market* for crops that can be grown *profitably* in Hawai'i.

c. Impact on the Growth of Diversified Crop Farming

The development of Ho'opili—in combination with other development projects in 'Ewa, Central O'ahu and elsewhere—involves the loss of too little good agricultural land to significantly affect the growth of diversified crop farming in Hawai'i. This conclusion is based on the above finding that ample land will remain available for diversified crops, with the available supply far exceeding the likely or potential demand.

AR00027531

However, as discussed previously, water-related improvements are needed to allow full use of some of the available farm lands on the North Shore. These improvements are the responsibility of the landowners and government agencies.

d. Mitigating Measures

In view of the negligible impact of the Project on the growth of diversified agriculture, mitigation measures for the loss of good agricultural land are not recommended beyond the measures addressed in Section 9.h above.

13. OFFSETTING BENEFITS

As previously mentioned, Ho'opili will commit about 1,554 acres of agricultural land to a non-agricultural use, of which about 1,375 acres are arable. In turn, Ho'opili—in combination with other private and State urban projects and changes in agriculture land use in Kunia—will require the the affected agricultural operations to relocate.

These adverse impacts to agriculture will be offset by the following benefits of the Project:

- About 11,750 homes for Hawai'i residents, along with business and commercial space, light-industrial space, parks and open space, and public facilities.
- For 'Ewa, relatively high housing densities which, in turn, will contribute to slower urbanization of agricultural land than would be the case with lower densities.
- Construction jobs provided by the development activity.
- At full development of the Project, on-site jobs provided by business, commercial, industrial, and home-service activities.
- Tax revenues (excise taxes, personal income taxes, corporate income taxes, property taxes, etc.) generated by the development activity.
- Tax revenues generated by the families and businesses that occupy the Project.
- Improved land and partial funding for schools, parks and other public facilities.

14. CONSISTENCY WITH STATE AND COUNTY POLICIES

a. Availability of Lands for Agriculture

The *Hawaii State Constitution*, the *Hawaii State Plan*, the *State Agriculture Functional Plan*, and the *General Plan of the City and County of Honolulu* call directly or implicitly for preserving the economic viability of plantation agriculture and promoting the growth of diversified crops. To accomplish this, an adequate supply of agriculturally suitable lands and water must be assured.

With regard to plantation agriculture, the Petition Area is no longer part of a sugar plantation since O'ahu Sugar Co. closed in 1995 for reasons unrelated to the Project.

With regard to diversified crops, development of the Petition Area will result in a loss of good farm land, and the farms on this land will have to relocate. However, this loss of agricultural land will not limit the growth of diversified crops since ample agricultural land is available on O'ahu and on other islands. This is due to the enormous supply of farm land that is now available following the contraction of plantation agriculture (Figure ES-1). However, improvements to the WWTP and the WIS will be needed to allow full use of the available farm lands on the North Shore.

b. Conservation of Agricultural Lands

In addition to the above, State policies call for conserving and protecting prime agricultural lands, including protecting agricultural lands from urban development.

However, these policies—which were written before the major contraction of plantation agriculture in the 1990s—assume implicitly that profitable agricultural activities eventually will be available to use all available agricultural lands. This has proven to be a questionable assumption in view of the enormity of the contraction of plantation agriculture, the abundant supply of land that came available for diversified agriculture, and the slow growth in the amount of land being used for diversified crops (see Figure ES-1).

Furthermore, discussions in the Agriculture portion of the *State Functional Plan* recognize that redesignation of lands from Agricultural to Urban should be allowed "... upon a demonstrated change in economic or social conditions, and where the requested redesignation will provide greater benefits to the general public than its retention in ...agriculture;" that is, when an "overriding public interest exists." In this regard, major changes in economic and social conditions have occurred as a result of:

AR00027532

— The on-going development of the City of Kapolei and the surrounding 'Ewa region as the second largest urban center in Hawai'i (see the policy discussion in the following subsection).

— Inadequate expansion in the supply of workforce housing which has contributed to high housing prices on O'ahu.

— The enormous contraction in plantation agriculture which has resulted in the supply of agricultural land far exceeding demand.

Moreover, development in the Petition Area will provide community benefits (about 11,750 homes and many on-site jobs) that far exceed those provided by agriculture (about 80 jobs after Syngenta is replaced by a new farm). In practice, however, development of the Petition Area is likely to have little or no impact on Statewide agricultural employment.

c. County 'Ewa Development Plan

The Petition Area is within the County's designated Urban Growth Boundary of the 'Ewa Development Plan in an area designated for residential development. Thus, the Project is consistent with the 'Ewa Development Plan in terms of future land use.

This Plan is part of a broader long-established County policy, with support from the State, to direct urban growth to 'Ewa, to portions of Central O'ahu, and to the primary urban center. In turn, the policy reduces development pressures on the outlying Districts of Ko'olau Loa, Ko'olau Poko, North Shore, and Wai'anae. The policy was designed to provide needed housing, jobs, and commercial and industrial space in compact areas; preserve agricultural lands and open space in Kunia, the North Shore, and outlying areas; preserve the "country" lifestyle of rural communities; and reduce the cost of providing government infrastructure and services.

Portions of the Project could be inconsistent with the phasing component of the currently approved 'Ewa Development Plan which indicates that urban expansion of the northern and eastern portions of the Petition Area is to occur after 2015. Such phasing in the current 'Ewa Development Plan would create nuisance issues by placing farm areas immediately upwind of the new Ho'opili homes. However, the 'Ewa Development Plan is in the process of being updated which, based on discussions with the County, is expected to reflect the removal of phasing from the Plan.

HO'OPILI:
IMPACT ON AGRICULTURE

1. INTRODUCTION[1,2]

D.R. Horton—Schuler Homes, LLC (dba D.R. Horton—Schuler Division) proposes to develop Ho'opili ("the Project"), a planned community to be located on 1,555.145 acres in the 'Ewa District, O'ahu. This area includes 1,553.844 acres that is referred to as the "Petition Area," plus another 1.301 acres in the State Urban District. Off-site drinking-water reservoirs and storm-water detention areas will add 45.120 acres, resulting in a total Project Area of 1,600.265 acres. The location of the Project, Tax Map Keys (TMKs), and the parcels and their acreages are shown in Figures 1, 2 and 3, respectively.

The Petition Area is designated for residential and related development in the City and County of Honolulu (County) 'Ewa Development Plan (see Figure 4), and is currently zoned "Agricultural." At the State level, the Petition Area is in the State Agricultural District (Figure 5). Thus, the Project will require a State Land Use District Boundary Amendment to Urban, and a change in County zoning. The conceptual land-use plan for the Project is shown in Figure 6.

This report addresses the impacts on agriculture of developing the Project. The material below gives the following information on the Project and its agricultural impacts: its location; a brief Project description; the agricultural conditions of the Petition Area, along with supporting Figures 7, 8 and 9; potential crops; locational advantages and disadvantages for crop production; surrounding land uses; historical agricultural uses; existing farm operations along with supporting Figure 10; for the affected farms, anticipated losses of farm land due to urban development and to other agricultural uses; anticipated changes in farming activity before the development of Ho'opili begins; availability of replacement farm land, along with supporting Figure 11; direct and cumulative impacts of the Project on affected farms; nuisance issues; the impact of the Project on the growth of diversified crop farming; benefits of the Project that will offset adverse agricultural impacts; and consistency of the Project with State and County agricultural policies.

Following the eleven figures at the end of the report, an Appendix provides a summary of State and County goals, objectives, policies and guidelines related to agricultural lands.

AR00027533

2. LOCATION OF THE PROJECT [2]

The Project is *makai* of the H-1 Freeway, *mauka* of 'Ewa Villages, west of Fort Weaver Road and Old Fort Weaver Road, and east of the planned University of Hawai'i West O'ahu (UHWO) campus and planned development by the Department of Hawaiian Home Lands (DHHL) (Figures 1 to 6). As shown in Figures 2 and 3, the Petition Area is identified by the following TMKs:

TMK	Parcel	Acres
9-1-18:04	A	52.289
9-1-18:01	B	447.592
9-1-17:04 (por), 59 & 72	C	1,053.963

3. PROJECT DESCRIPTION[2]

Ho'opili will include about 11,750 single- and multi-family homes; business and commercial space; light-industrial space; parks and open space; public facilities (e.g., schools); and associated infrastructure (e.g., roadways, an electrical system, a telephone system, a cable-TV system, Internet systems, a drinking water system, a non-drinking water system for irrigating landscaped areas, sewers, and drainage).

4. AGRICULTURAL CONDITIONS

a. Soil Types[3]

As shown in Figure 7, the Petition Area consists of 19 soil types plus former reservoir sites. The complete names of the soil types and their slopes are:

- — EaB Ewa silty clay loam, 3 to 6 percent slopes
- — FL Fill land, mixed
- — HLMG Helemano silty clay, 30 to 90 percent slopes
- — HxA Honouliuli clay, 0 to 2 percent slopes
- — HxB Honouliuli clay, 2 to 6 percent slopes
- — Kfb Kaloko clay, noncalcerous variant
- — KlaB Kawaihapai stony clay loam, 2 to 6 percent slopes
- — KlA Kawaihapai clay loam, 0 to 2 percent slopes
- — KlbC Kawaihapai very stony clay loam, 0 to 15 percent slopes

- — KmaB Keaau stony clay, 2 to 6 percent slopes
- — KyA Kunia silty clay, 0 to 3 percent slopes
- — KyB Kunia silty clay, 3 to 8 percent slopes
- — KyC Kunia silty clay, 8 to 15 percent slopes
- — MuB Molokai silty clay loam, 3 to 7 percent slopes
- — MuC Molokai silty clay loam, 7 to 15 percent slopes
- — WkA Waialua silty clay, 0 to 3 percent slopes
- — W Water (former reservoir)
- — WzA Waipahu silty clay, 0 to 2 percent slopes
- — WzB Waipahu silty clay, 2 to 6 percent slopes
- — WzC Waipahu silty clay, 6 to 12 percent slopes

Table 1 shows the estimated acreage of each soil type according to its quality as rated by the Natural Resources Conservation Service (NRCS), formerly known as the Soil Conservation Service.

As indicated, HxA, KyA and WzA are the predominant soil types, comprising about 63.5% of the Petition Area.

b. Soil Ratings

Three classification systems are commonly used to rate Hawai'i soils: (1) Land Capability Grouping, (2) Agricultural Lands of Importance to the State of Hawai'i, and (3) Overall Productivity Rating.

Land Capability Grouping (NRCS Rating)[3]

The 1972 Land Capability Grouping by the U.S. Department of Agriculture, NRCS rates soils according to eight levels, ranging from the highest classification level I to the lowest VIII.

Table 1 shows that about 1,045.6 acres (67.3%) of the Petition Area have soils that are rated I. Class I soils have few limitations that restrict their use.

About 226.9 acres (14.6%) have soils that are rated IIe. Class II soils have moderate limitations that reduce the choice of plants or require moderate conservation practices. The subclassification "e" indicates that the soils are subject to erosion.

AR00027534

Table 1. Ho'opili Petition Area: Soil Types and NRCS Ratings

Soil Types	Acres	%	NRCS Ratings[1]
Higher-quality			
HxA	243.9	15.7%	I
KlA	10.9	0.7%	I
KyA	411.6	26.5%	I
WkA	48.2	3.1%	I
WzA	331.0	21.3%	I
EaB	48.2	3.1%	IIe
HxB	14.0	0.9%	IIe
KlaB	4.7	0.3%	IIe
KyB	3.1	0.2%	IIe
MuB	76.1	4.9%	IIe
WzB	80.8	5.2%	IIe
Moderate-quality			
KyC	4.7	0.3%	IIIe
MuC	46.6	3.0%	IIIe
WzC	115.0	7.4%	IIIe
Kfb	15.5	1.0%	IIIw
KmaB	3.1	0.2%	IIIw
Lower-quality			
KfbC	4.7	0.3%	VIs
HLMG	68.4	4.4%	VIIe
FL	7.8	0.5%	n.r.
W (former reservoirs)	15.5	1.0%	n.r.
Total	1,553.8	100.0%	

1. Assuming all soils are irrigated.

Source: U.S. Department of Agriculture, Soil Conservation Service, *Soil Survey of Islands of Kauai, Oahu, Maui, Molokai, and Lanai, State of Hawaii*, August 1972.

About 166.3 acres (10.7%) have soils rated IIIe. Class III soils have severe limitations that reduce the choice of plants, require special conservation practices, or both.

About 18.6 acres (1.2%) have soils rated IIIw. The subclassification "w" indicates that the soils have excess water (i.e., they are poorly drained).

About 4.7 acres (0.3%) have soils rated VIs. Class VI soils have severe limitations that make them generally unsuitable for cultivation and restrict their use largely to pasture. The subclassification "s" indicates that the soils are rocky or stony.

About 68.4 acres (4.4%) have soils rated VIIe. Class VII soils have very severe limitations that make them unsuitable for cultivation and restrict their use largely to pasture.

About 23.3 acres (1.5%) have soils that are not rated because it is fill land or land associated with former reservoirs.

Agricultural Lands of Importance in the State of Hawai'i (ALISH)[4]

ALISH ratings were developed in 1977 by the NRCS, the UH College of Tropical Agriculture and Human Resources, and the State of Hawai'i, Department of Agriculture. This system classifies land into three broad categories: (a) Prime agricultural land which is land that is best suited for the production of crops because of its ability to sustain high yields with relatively little input and with the least damage to the environment; (b) Unique agricultural land which is non-Prime agricultural land used for the production of specific high-value crops; and (c) Other agricultural land which is non-Prime and non-Unique agricultural land that is important to the production of crops.

About 1,317.1 acres (84.8%) of the Petition Area have soils that are rated Prime; about 155.4 acres (10%) are rated Other; and about 80.8 acres (5.2%) are unclassified (Figure 8).

Overall Productivity Rating (LSB Rating)[5]

In 1972, the University of Hawai'i Land Study Bureau (LSB) developed the Overall Productivity Rating, which classifies soils according to five levels, with A representing the class of highest productivity and E the lowest.

About 517.4 acres (33.3%) of the Petition Area have soils rated A, about 890.3 acres (57.3%) are rated B, about 7.8 acres (0.5%) are rated C, about 17.1

AR00027535

acres (1.1%) are rated D, about 87.0 acres (5.6%) are rated E, and about 34.2 acres (2.2%) are unrated (Figure 9).

Summary Evaluation of Soil Quality

These soil-rating systems suggest that about 1,340 ± 65 acres (86 ± 4%) of the Petition Area are comprised of higher-quality soils (I and II for the NRCS ratings, Prime for ALISH, and A and B for the LSB).

c. **Soil Characteristics**[3,5]

The better soils in the Petition Area exhibit a number of favorable characteristics: the soils are deep (over 30 inches); they have good machine tillability; they are well-drained; the erosion hazard is none to slight; and the slopes are gentle (see below). However, some of the soils (e.g., HxA) are very sticky and very plastic clay, and others (e.g., KyA) are medium to extremely acidic.

d. **Arable Land**[1]

Consistent with the above ratings, existing agricultural leases indicate that about 1,375 acres (88%) of the Petition Area are arable land. This assessment is based on the fact that the land classified as arable was once cultivated in sugarcane.

e. **Elevations**[6]

Elevations range from about 50 feet near the southeast corner of the property to about 220 feet near the 228' Elevation Reservoir (Figure 1).

f. **Terrain**[2,3]

Most of the Petition Area has flat or gently sloping land, with slopes ranging from 0% to 6%. The exception is Honouliuli Gulch which runs through the northeast corner of the Petition Area and separates Syngenta Seeds from Aloun Farms (Figure10).

g. **Climatic Conditions**

Like other areas in Hawai'i, the 'Ewa Plain has a mild *semi*tropical climate which is due primarily to three factors: (1) Hawai'i's mid-Pacific location near

the Tropic of Cancer, (2) the surrounding warm ocean waters that vary little in temperature between the Winter and Summer seasons, and (3) the prevailing northeasterly tradewinds that bring air having temperatures that are close to those of the surrounding waters.

Solar Radiation[7]

The 'Ewa Plain is one of the sunniest areas on O'ahu. It is semi-arid, with a relatively warm and dry climate and an average daily insolation ranging from about 470 to 500 calories per square centimeter.

Rainfall[8]

Rainfall in the Petition Area is low: averaging about 25 inches per year. Most of this rain occurs during the Winter rainy season (October through February), while the Summer months (May through September) are hot and dry. Monthly average rainfall is lowest at about 0.5 inch in August and highest at about 3 inches in January.

Temperatures[8]

Average low temperatures range from about 60° Fahrenheit in the Winter to about 69° in the Summer. Average high temperatures range from about 78° in the Winter to 87° in the Summer.

Winds and Storms[8,9]

Wind speeds average about 9.4 miles per hour (mph) in the Winter and about 13.1 mph in the Summer. Tradewinds blow from a northeasterly direction, but they tend to break down during the Fall, giving way to lighter, more variable wind conditions through the Winter and into early Spring. Storms are infrequent, occurring mostly from the south in the Winter months.

h. **Irrigation Water**[1]

The fields are irrigated with groundwater pumped from wells in the area. The lift is short, so pumping costs are relatively low. None of the fields are irrigated with water from Waiahole Ditch.

AR00027536

i. Road Access[6]

Access to the fields is provided by plantation roads that connect to Farrington Highway, Fort Weaver Road, and Palehua Road.

Palehua Road provides a route for farmers to drive their trucks under the H-1 Freeway between the Petition Area and their operations in Kunia without having to use public roads. Portions of this road, including the segment between the H-1 Freeway and Farrington Highway, will become the North-South Road that will cross the 'Ewa Plain and provide additional access to the H-1 Freeway (Figure 6).

j. Summary

Of the approximately 1,553.8 acres in the Petition Area, soil ratings indicate that about 1,340 ± 65 acres have favorable agronomic conditions for crop production. This area has high-quality soils, flat or gently sloping terrain, high solar radiation, low pumping costs for irrigation water, and good access. Because of the sunny conditions, the fields are well-suited for growing crops during the Winter months. This is consistent with existing agricultural leases which indicate that about 1,375 acres (88%) are arable land.

5. POTENTIAL CROPS[10-14]

Based on the above agronomic conditions, most of the Petition Area is well-suited for low-elevation crops, including but not limited to the following crops which are commercially grown in 'Ewa: apple banana, basil, bell peppers, broccoli, cabbages, canteloupes, chives, choy sum, cucumbers, daikon, green beans, green onions, honeydew, kai choy, leaf lettuces, long beans, pak choy, romaine, seed corn, string beans, sweet corn, sweet potatoes, sweet onion, taro leaves, tomatoes, watermelons, and zucchini.

6. LOCATIONAL ADVANTAGES AND DISADVANTAGES FOR CROP PRODUCTION

The Petition Area is well-located for serving the Honolulu consumer market and export markets. This is due to the short trucking distance to the Honolulu markets, the Honolulu International Airport, and Honolulu Harbor.

In the U.S. mainland market, farmers in Hawai'i must compete against farmers on the mainland and in Mexico, Central and South America, the Caribbean, Australia, New Zealand, Southeast Asia, etc. Most of the competing farm areas have lower production and delivery costs than Hawai'i does. Competing against Mexico is particularly difficult given the North America Free Trade Agreement (NAFTA) and Mexico's proximity to major U.S. markets.

7. SURROUNDING LAND USES[2]

Existing and planned land uses surrounding the Petition Area are shown in Figure 6. By direction, these uses are as follows:

- To the north (*mauka*) are the H-1 Freeway, agricultural fields in Kunia and grazing lands in the Kunia foothills. All of these Kunia lands were once owned by James Campbell Company LLC (JCC). But over the past few years, JCC sold some of them and is in the process of selling the remainder. These lands are expected to remain in agriculture with the exception of land near Schofield Barracks which was purchased by the U.S. Army.
- To the east are Fort Weaver Road, Old Fort Weaver Road, the West Loch Golf Course, and the residential communities of Waipahu, Honouliuli, and West Loch Estates
- To the south (*makai*) are the 'Ewa Villages and other residential communities.
- To the west are agricultural fields on land owned by the State. These lands are in the Urban District and are scheduled to be developed as part of UHWO campus and related residential and commercial development, DHHL East Kapolei residential projects, DHHL commercial center, and the Kroc Community Center on DHHL land (Figure 6).

As indicated, urban development has occurred or will occur to the east, south and west of the Petition Area. Homes to the west will be downwind of the Project.

8. HISTORIC AGRICULTURAL USES[1,15-18]

Following the Mahele of 1848, the Petition Area was part of a 43,250-acre grant which, from 1871 to 1877, was leased for cattle grazing. In 1877, James Campbell purchased most of the property (including the Petition Area) for cattle ranching.

AR00027537

In 1889, Campbell leased most of the 'Ewa Plain to Benjamin Dillingham who, in turn, subleased the land to the 'Ewa Plantation Company to cultivate sugarcane. The 'Ewa Plantation Company grew quickly and continued operating until 1970 when the O'ahu Sugar Company, Ltd. (OSCo) took over operations. Sugarcane cultivation continued on about 1,375 acres of the Petition Area until 1995 when OSCo closed.

Since the mid-1990s, the Petition area has been leased for diversified crop farming (that is, crops other than sugarcane or pineapple).

9. EXISTING AGRICULTURAL OPERATIONS

a. Agricultural Leases[1]

Currently, about 1,497 acres (96%) of the Petition Area are leased to three companies to grow diversified crops. As shown in Figure 10, these companies are:

- Aloun Farms, Inc. (about 1,100 acres)
- Sugarland Farms, Inc. (about 197 acres)
- Syngenta Seeds, Inc. (about 200 acres)

In addition, Fat Law's Farm subleases about 100 acres from Aloun Farms. These four farms are described below.

b. Aloun Farms, Inc.[1,13]

Since 1997, Aloun Farms has leased about 1,097 acres of the Petition Area, of which about 1,003 acres are considered arable. The original lease was with The Estate of James Campbell, now James Campbell Company, LLC (Campbell). The lease expires in 2013, but is subject to withdrawal rights by the landowner. In April 2007, lease rents were about $194 per acre per year for arable land, which is below current market rents for good agricultural land on O'ahu.

Aloun Farms leases an additional 3 acres of arable land for its major facilities, discussed below. The lease expires in 2017 and the landowner does not have withdrawal rights. In April 2007, lease rents were $150 per acre per year.

In addition to the lands in the Petition Area, Aloun Farms and a company affiliated with it (A.M. Enterprises, LLC) lease about 1,440 acres in 'Ewa, Kunia and Central O'ahu. Thus, Aloun Farms (with its affiliate) leases a total of about 2,540 acres. However, about 100 acres of its Ho'opili lands are subleased, resulting in a net of about 2,440 acres available to Aloun Farms. Nearly all of this land is arable, and most of the fields are of high quality. Having fields in 'Ewa, Kunia and Central O'ahu allows Aloun Farms to maintain year-round production of certain crops by taking advantage of the climatic and seasonal differences between the planting areas.

Averaged over time, about 910 acres (37%) are in crop. They farm their 'Ewa fields less intensively than the average (about 33% of the land in crop), while the Kunia and Central O'ahu fields are farmed more intensively (about 50% of the land in crop).

The 3-acre parcel mentioned above has two buildings on it having a combined footprint of about 22,600 square feet. The buildings are used by Aloun Farms for its cooling plant, packing facilities, and some of its warehouse space. To the east side of this parcel and within the Petition Area, nine buildings having a combined footprint of about 26,900 square feet provide additional operating and storage space.

Aloun Farms with its affiliate is the second largest diversified fruit and vegetable operation in Hawai'i. It is managed by skilled entrepreneurs who have special expertise in Asian vegetables and melons and in Asian markets. In 2006, Aloun Farms provided about 140 full-time-equivalent (FTE) jobs, including about 20 jobs involved with managing the operations. Salaries average about $22,000 per year.

Crops grown by Aloun Farms for the Hawai'i and overseas markets include:[11]

- Vegetables: bean shoot, broccoli, camote leaf (potato leaf), choy sum, daikon (Chinese and Korean), green onion, Japanese cucumber, kabocha squash, kai choy, long beans, long eggplant, pak choy, paria leaf (bitter melon leaf, peppers, radish, romaine and leaf lettuces, saluyot, string beans, sweet corn, sweet onion, won bok (Chinese cabbage), and zucchini.
- Fruits and melons: apple banana, cantaloupe, honeydew, Korean melon, Thai watermelon (small variety seedless red, yellow, seedless yellow), and watermelon.
- Herbs and spices: basil, chives, lemongrass, mint, and parsley (American and Chinese).
- Seed crops: corn and potatoes.

About 30% of the crops are grown in specific locations that take advantage of the distinctive climatic and agronomic conditions found in 'Ewa, but could be grown in areas having similar conditions. For certain crops, a few seasons are

AR00027538

required to determine the best location for the crop, the best variety for the location, the best time to plant, etc.

Table 2 summarizes the consultant's estimates of the 2007 economic activity generated by agricultural operations in the Petition Area, along with the assumed multipliers used in the calculations. As shown for Aloun Farms, the estimates are approximately $3 million per year in revenues, an average employment of 45 jobs, and about $1 million per year in payroll.

c. **Fat Law's Farm, Inc.**[1,11,12]

Fat Law's Farm subleases about 100 acres from Aloun Farms. Their fields are located in the southeast corner of the Aloun lands (see Figure 10), extending south along the lower half of Old Fort Weaver Road and continuing along Fort Weaver Road. The operators began farming at this location on a little over 61 acres in 1996. The lease is month-to-month, and lease rents in April 2007 were about $630 per acre per year for arable land. At any given time, about 60 acres (60%), on average, are in crop and about 40 acres are between crops.

The company farms no other land in Hawai'i. However, they market produce that is farmed by relatives and friends on about 120 to 150 acres. Also, they have leased 150 acres in Hainan, China were they plan to grow tropical fruits (e.g., papaya) and vegetables to be marketed in Hong Kong, mainland China and Japan.

Fat Law's Farm has two on-site structures (about 12,800 square feet under roof) which house their offices, cooling plant, and warehouse space.

Fat Law's Farm is one of Hawai'i's main producers of fresh herbs and vegetables. Its primary crops are basil (Thai, hot and sweet), cucumbers, long beans, malongai leaves, and taro (leaves and stem). Other crops (which the Farm grows itself or markets for other farmers) include betai leaf, bitter melon, chives, curry leaf, la lop, long squash, ngo gai, peppermint, and Thai ginger.

Hawai'i customers include farmers' markets, supermarkets, produce stores, restaurants and wholesalers. The operation also exports Thai basil, sweet basil, taro leaves, chives, curry leaves, and malongai leaves to at least 14 major cities across the United States. They are nicknamed the "King of Basils," due to the fact that they provide more than 60% of the basil exports from Hawaii to the mainland.

In 2006, the U.S. Small Business Administration honored them as Exporter of the Year for Hawai'i and the Western United States. Also, Fat Law's Farm has received many awards for their outreach efforts to help immigrant small-scale farmers. They have provided encouragement, advice on farming practices, marketing help, and other assistance.

Table 2. Economic Activity Generated by Agricultural Operations in the Petition Area: 2007
(approximate estimates by DAHI)

	Aloun Farms	Fat Law's Farm	Jefts Farms	Syngenta	TOTAL
Agricultural acreage					
Total	1,000[1]	100	197	200	1,497
Arable land	903[2]	100	192	177	1,372
Average land in crop					
Percentage in crop	33.3%	60%	33.3%	25%	
Acres in crop	301	60	64	44	469
Adjustments	___	___	10[3]	8[4]	18
Adjusted acres in crop	301	60	74	52	487
Revenues (average annual)					
Revenue per acre in crop (thousands)	$10	$30	$10	$17	
Total revenues (millions)	$3.0	$1.8	$0.7	$0.9	$6.4
Employment (average)					
Jobs per 100 acres in crop	15	33	10	25	
Total Jobs	45	20	7	13	85
Payroll (average annual)					
Salary per job (thousands)	$22	$22	$25	$25	
Total payroll (millions)	$1.0	$0.4	$0.2	$0.3	$1.9

1. Excludes 100 acres leased to Fat Law's Farm.
2. Excludes 3 acres used for facilities.
3. 30 acres of Syngenta land used by Jefts Farms, with an average of 33% in crop, and assuming no reduction in acreage farmed by Jefts Farms.
4. 30 acres of Jefts Farms land used by Syngenta, with an average of 25% in crop, and assuming no reduction in acreage farmed by Syngenta.

Source: Decision Analysts Hawai'i, Inc.

AR00027539

Fat Law's Farm sells about $3 million of fresh herbs and vegetables annually. Approximately 60% of the sales are derived from its own production, while the remainder comes from selling produce from other farms.

Employment averages about 20 FTE jobs, including six management positions. Workers earn about $6.75 to $7.25 per hour.

For the immediate future, about 5 acres will be converted to organic crops, followed by additional conversions if production proves profitable and demand is sufficient. Growing organic crops will increase revenues since they command higher prices, while the cost of chemicals will be reduced. However, the crops will have to be grown in plastic greenhouses to protect them from insects and wind.

Table 2 summarizes the consultant's estimates of the 2007 economic activity for Fat Law's Farm that takes place in the Petition Area. As shown, the estimates are approximately $1.8 million per year in revenues, an average employment of 20 jobs, and about $400,000 per year in payroll.

d. Sugarland Farms, Inc. ("Jefts Farms")[1,13,14]

Since late 1994, Sugarland Farms has leased about 197 acres in the Petition Area, of which about 192 acres are arable (see Figure 10). The original lease was with Campbell. The lease is year-to-year, and lease rents in April 2007 were about $231 per acre per year for arable land, which is slightly below current market rents for good agricultural land on O'ahu. In addition, Sugarland Farms and Syngenta have an arrangement that allows them to exchange between the two of them 30 acres at no charge. This enables Sugarland Farms to cultivate 30 additional acres in the Petition Area (see Figure 10). Thus, Sugarland Farms cultivates a total of about 227 acres in the Petition Area. The advantage to Syngenta is that it can more easily isolate seed plantings away from its other varieties to avoid cross-pollination.

Sugarland Farms is part of a larger group of family agricultural operations that collectively is referred to in this report as the "Jefts Farms." They include, but are not limited to: Larry Jefts Farms, LLC; Sugarland Farms, Inc.; Sugarland Distribution, Inc.; Waikele Farms, Inc.; and Akea Farms, Inc.

Jefts Farms comprises the largest diversified fruit and vegetable agricultural operation in Hawai'i, with agricultural lands estimated by the consultant at over 5,000 acres. Their fields are located in, but are not limited to, the following areas:

- 'Ewa fields in the Petition Area as noted above.
- Other 'Ewa fields that are sandwiched between the H-1 Freeway and Farrington Highway, and between and to the west of the Sugarland fields shown in Figure 10. These lands are leased from the State.
- Other 'Ewa fields east of Fort Weaver Road and within the Navy's Blast Zone for the West Loch Naval Magazine. Jefts Farms leases these lands from the U.S. Navy.
- Fields in Kunia north of the H-1 Freeway and west of Kunia Road. Jefts Farms leases some of this land from the State and, until recently, the remainder was leased from Campbell. However, most of the Campbell land in lower Kunia was sold to Pioneer Hi-Bred International and the Monsanto Company (Monsanto) for expanded seed-corn operations.
- Fields in Kunia to the north of the H-1 Freeway and east of Kunia Road. Jefts Farms leases most of these lands from Robinson Estate and the remainder from the State.
- Lands at Mokule'ia, O'ahu that are leased from Dole Food Company Hawai'i.
- Lands on Moloka'i.

The heart of Jefts Farms is the Kunia land that it leases from Robinson Estate. Jefts Farms main offices, cooling plant, packing facilities, warehouses, etc., are located in Kunia near the Hawai'i Country Club. These Robinson lands are outside the County's Urban Growth Boundary and, as such, will remain in agriculture for the foreseeable future.

Most of the Jefts Farms fields in Kunia and Central 'Ewa are of high quality. Averaged over time, about one-third of these lands is in crop. By having fields in both Kunia and 'Ewa, Jefts Farms is able to take advantage of the climatic and seasonal differences between the two planting areas to maintain year-round production of certain crops. For example, tomatoes and peppers are planted in Kunia during the Summer months, and in 'Ewa during the Winter months.

Principal crops grown by Jefts Farms include: bell peppers, cabbages, canteloupes, cucumbers, green beans, onions, sweet potatoes, tomatoes, and watermelons. Most of the produce is grown for the Hawai'i market, but some is exported. In addition to its own crops, about 150 acres are subleased each season to Syngenta for its seed-corn operation (see below)—this is in addition to the 30 acres discussed above that Jefts Farms exchanges with Syngenta.

AR00027540

Employment by Jefts Farms is estimated by the consultant to exceed 150 farmhands. Annual salaries range from about $16,600 ($8 per hour) to over $60,000 for about a dozen key managers and technical experts.

Table 2 summarizes the consultant's estimates of the 2007 economic activity generated by farming activity in the Petition Area. As shown, the estimates for Jefts Farms are approximately $700,000 per year in revenues, an average employment of 7 jobs, and about $200,000 per year in payroll. This estimate takes into account the 30 acres of Syngenta land farmed by Jefts Farms.

e. Syngenta Seed, Inc.[II.34]

Syngenta is a global agribusiness headquartered in Switzerland with roots going back to 1758. In 2005, company sales amounted to about $8.1 billion which was derived from selling seeds (corn, soybean, other field crops, vegetables, and flowers) and crop-protection products (herbicides, fungicides and insecticides).

In Hawai'i, Syngenta is one of five major seed companies that use conventional breeding practices and genetic engineering to create improved or new parent seed corn—that is, corn seeds that will provide high yields of quality corn from plants that tolerate droughts and resist diseases. Most of the world's commercially grown corn can be traced back to Hawai'i. Syngenta and other companies also conduct research on soybeans, and other seed companies conduct research on sunflowers, soy, wheat and cotton. These seed companies are expanding steadily in Hawai'i: from the 2000/01 to the 2005/06 crop year, the amount of land in seed crops increased from 3,100 acres to 4,220 acres, and the value of the crop increased from about $37.5 million to about $70.4 million. The primary advantage of operating in Hawai'i is the year-round growing conditions which allow faster development of new hybrids and varieties: three crops per year are possible in Hawai'i versus one crop per year on the mainland. Hawai'i also provides a stable political and economic environment relative to other regions having similar agronomic conditions.

Since 1995, Syngenta has leased about 200 acres in the Petition Area, of which about 177 acres are arable (see Figure 10). The original lease was between Campbell and Garst Seed Company. Syngenta took over the lease when it purchased Garst in 2004. The lease expires in 2008, but is subject to withdrawal rights by the landowner. In April 2006, lease rents were about $215 per acre per year for arable land, which is slightly below current market rents for good agricultural land on O'ahu.

On average, about 45 acres of Syngenta's land in the Petition Area are used for parent seed operations (i.e., operations that increase the supply of selected seed varieties). The corn is normally planted in patches with considerable separation from other corn varieties in order to control pollination of the plants. In addition to its own plantings, Syngenta has an arrangement that allows Jefts Farms to use about 30 acres of Syngenta land in the Petition Area for vegetable crops. In exchange, Syngenta has use of a similar amount of land from Jefts Farms.

In total, Syngenta leases or subleases about 740 acres on O'ahu for its seed operations, including:

- The approximately 200 acres mentioned above.
- About 360 acres in Kunia that are under a long-term lease, subject to cancellation clauses. These lands front the west side of Kunia Road below Waiahole Ditch. The fields are used to research corn varieties and, to a lesser extent, soybeans. Also, Syngenta's processing facilities, warehouse, and offices are located there.
- About 30 acres that are made available as part of a land exchange with Jefts Farms. Plantings can occur in 'Ewa or Kunia.
- About 150 acres that are subleased seasonally from Jefts Farms. Plantings occur in 'Ewa and Kunia.

Most of Syngenta's fields in Kunia and 'Ewa are of high quality. In addition to its O'ahu operations, Syngenta has about 3,000 acres on Kaua'i for its seed operations.

On O'ahu, Syngenta provides employment for about a dozen full-time workers, 15 to 20 part-time workers, and about 60 to 90 temporary workers during the peak Winter season. Corresponding figures for the parent-seed portion of their operation—which includes farming the 'Ewa fields—are about two full-time workers, four part-time workers, and 10 to 15 workers in surges. Wages range from $8.75 to $17 per hour.

Table 2 summarizes the consultant's estimates of the 2007 economic activity generated by agricultural operations in the Petition Area. As shown, the estimates for Syngenta are approximately $900,000 per year in revenues, an average employment of 13 jobs, and about $300,000 per year in payroll. This estimate takes into account the 30 acres of Jefts Farms land that is farmed by Syngenta.

AR00027541

f. Summary of Economic Activity of Agricultural Operations in the Petition Area; 2007

For all four agricultural operations, the consultant's estimates of the 2007 economic activity they generate in the Petition Area totals approximately $6.4 million per year in revenues (about $4,665 per acre on average), an average employment of about 85 jobs (about 6.2 jobs per 100 acres), and about $1.9 million per year in payroll (see Table 2).

10. CUMULATIVE LOSS OF LAND FOR THE AFFECTED AGRICULTURAL OPERATIONS

In addition to the leased and subleased lands that gradually will be lost as the Project is developed over a 20-year period, three of the four agricultural operations in the Petition Area will eventually lose agricultural lands to (1) other private and State urban projects in 'Ewa and Central O'ahu that are within the County's Urban Growth Boundary, and (2) other agricultural operations in Kunia. The cumulative loss of land for the affected agricultural operations is addressed in this section. The related cumulative impact on them is addressed in Section 13.

a. Overview[1,18,19-23]

For the affected agricultural operations, the approximate cumulative reductions in acreages are summarized in Table 3, and include the following:

— Urban Projects within the County's Urban Growth Boundary

- Ho'opili, Ewa: about 1,497 acres of farm land currently leased or subleased to the four farms in the Petition Area. Some of the land will used by the State Department of Transportation for the North-South Road.
- State projects, 'Ewa: about 945 acres currently farmed by Aloun Farms and Jefts Farms. State projects include (1) the UH West O'ahu campus and related residential and commercial development, and (2) a DHHL residential and commercial development (see Figure 6).
- Koa Ridge, Central Oahu: about 430 acres currently farmed by Aloun Farms. This is a proposed residential community by Castle & Cooke Homes Hawai'i.

— Changes in Agricultural Uses

- State Ag Park, Kunia: about 150 acres currently farmed by Jefts Farms.

Table 3. Cumulative Loss of Land for the Affected Agricultural Operations
(approximate acreage estimates by DAI-II)

	Aloun Farms	Fat Law's Farm	Jefts Farms	Syngenta	TOTAL
Urban Projects					
Ho'opili, 'Ewa	1,000	100	197	200	1,497
State Projects, 'Ewa[1]	850	-	95	-	945
Koa Ridge, Central O'ahu	430	-	-	-	430
Agricultural Uses					
State Ag Park, Kunia	-	-	150	-	150
Monsanto Co., Kunia	-	-	220	360	580
Total	2,280	100	662	560	3,602

1. UHWO, DHHL and other State projects.

Source: Decision Analysts Hawai'i, Inc.

- Monsanto, Kunia: about 580 acres currently farmed by Jefts Farms and Syngenta. Monsanto is a major seed company that purchased land in 2007 in lower Kunia west of Kunia Road.

Altogether, the four agricultural operations in the Petition area are projected to lose about 3,600 acres of their leased land: about 2,870 acres to private and State urban projects located within the County's Urban Growth Boundary, and about 730 acres which will remain in agriculture but will be farmed by other operators. Syngenta's and Jefts Farms' losses of acreage to Monsanto (another agricultural operation) may occur within a few years. The agricultural land lost to urban projects is likely to begin in a few years and continue until as late as 2030.

b. Aloun Farms

Aloun Farms is expected to gradually lose about 2,380 acres to urban projects (see Table 3). This will leave Aloun Farms with just 160 acres of its current Kunia farm, assuming that the lease to this land is renewed. This is the only land leased by Aloun Farms that is outside the County's Urban Growth Boundary.

AR00027542

c. **Fat Law's Farm**

As shown in Table 3, Fat Law's Farm eventually will lose all of its 100-acre farm to Ho'opili.

d. **Jefts Farms**

Table 3 shows that Jefts Farms is projected to lose about 660 acres of good farm land: approximately 197 acres to Ho'opili, 95 acres to State urban projects, 150 acres for the State Ag Park in Kunia, and 220 acres to Monsanto's seed operation. Also, Jefts Farms will eventually lose access to Syngenta's 30 acres in 'Ewa since this is within the Petition Area. In addition, Jefts Farms lost about 230 acres of cultivated land in lower Kunia that Campbell sold to Pioneer Hi-Bred International (a seed company) in 2006.

Even with these acreage reductions, Jefts Farms will retain an estimated 4,000+ acres of farm land, and will remain the largest diversified fruit and vegetable farm operation in Hawai'i. On O'ahu, all of Jefts Farms remaining land is located outside the County's Urban Growth Boundary.

e. **Syngenta**

Syngenta is expected to lose about 560 of its 740 acres on O'ahu—this includes 360 acres purchased recently by Monsanto for its seed operations, and 200 acres in the Petition Area (see Table 3).

In addition to the direct acreage losses, Syngenta will no longer have use of the 30 acres on Jefts Farms leased land since Syngenta will no longer have land in 'Ewa to provide to Jefts Farms in exchange (see Section 9.d). Furthermore, inasmuch as Jefts Farm will have less land to sublease, Syngenta could lose access to some of the 150 acres that they sublease from Jefts Farms.

11. CHANGES TO AGRICULTURAL OPERATIONS BEFORE HO'OPILI IS DEVELOPED

a. **Relocation of Syngenta**

Monsanto's 2007 land purchase in lower Kunia includes all of the 360 acres in Kunia that comprise the core of Syngenta's operations on O'ahu. Because of this purchase, the consultant anticipates that Syngenta will relocate from Kunia to some other area. And because of termination clauses in the existing lease, it is likely that this relocation will occur within the next few years—with or without Ho'opili, and before Ho'opili construction even begins.

If Syngenta is to retain its same size after relocating, then they will require about 740 acres of replacement land—the approximate acreage that they now lease and sublease in Kunia and 'Ewa. Syngenta could relocate to Kaua'i where they already lease about 3,000 acres, although the North Shore of O'ahu is also a possibility.

If the company relocates to Kaua'i, then the demand for good farm land on O'ahu will decrease by about 740 acres while the demand on Kaua'i will increase by a similar amount (the acreage could be somewhat less than 740 acres if Syngenta farms their existing lands on Kaua'i more intensively). In this scenario, the economic activity for Syngenta's O'ahu operation would be transferred to Kaua'i. This would include about a dozen full-time workers, 15 to 20 part-time workers, and about 60 to 90 temporary workers during the peak Winter season.

b. **Interim Agriculture on Land Vacated by Syngenta**

After Syngenta vacates the 200 acres it now leases in the Petition Area, it is expected that the land will be leased to a farmer until construction on this site is ready to begin.

Future economic activity associated with diversified crop farming on the land to be vacated by Syngenta is estimated at about $600,000 per year in revenues (based on 177 arable acres with one-third in crop, and revenues of about $10,000 per acre per year); about six jobs (based on ten jobs per 100 acres in crop); and a payroll of about $150,000 per year (based on about $25,000 per job).

c. **Reduction in Jefts Farms Operations**

After Syngenta vacates its 'Ewa fields, Jefts Farms will lose the 30 acres it now farms there as part of its land exchange with Syngenta (unless Jefts Farms leases the entire 200 acres). Thus, the economic activity shown in Table 2 for Jefts Farms will decrease slightly: about $100,000 less in annual revenues, about one less job, and about $25,000 less in annual payroll.

d. **Summary of Economic Activity of Agricultural Operations in the Petition Area: 2010**

Table 4 shows the consultant's resulting estimate of the economic activity generated by farming in the Petition Area by about 2010 after Syngenta is replaced by some other farming operation but before the Ho'opili construction begins. As shown, projected economic activity includes approximately $6 million per year in revenues (about $4,373 per acre on average), an average employment of slightly less than 80 jobs (about 5.6 jobs per 100 acres), and about $1.7 million per year in payroll.

AR00027543

Table 4. Projected Economic Activity Generated by Agricultural Operations in the Petition Area: 2010
(approximate estimates by DAHI)

	Aloun Farms	Fat Law's Farm	Jefts Farms	Interim Farm	TOTAL
Farm acreage					
Total	1,000[1]	100	197	200	1,497
Arable land	903[2]	100	192	177	1,372
Average land in crop					
Percentage in crop	33.3%	60%	33.3%	33.3%	
Acres in crop	301	60	64	59	484
Revenues (average annual)					
Revenue per acre in crop (thousands)	$10	$30	$10	$10	
Total revenues (millions)	$3.0	$1.8	$0.6	$0.6	$6.0
Employment (average)					
Jobs per 100 acres in crop	15	33	10	10	
Total Jobs	45	20	6	6	77
Payroll (average annual)					
Salary per job (thousands)	$22	$22	$25	$25	
Total payroll (millions)	$1.0	$0.4	$0.15	$0.15	$1.7

1. Excludes 100 acres leased to Fat Law's Farm.
2. Excludes 3 acres used for facilities.

12. AVAILABILITY OF REPLACEMENT LAND

As discussed in Sections 10 and 11, the farms that operate within the Petition Area will lose land to Ho'opili and to other urban projects, and to changes in agricultural uses. The impact of this cumulative loss of land on the affected agricultural operations will depend on the amount and quality of replacement land that will be available to them in the future to offset their land losses. The availability of replacement land Statewide and on O'ahu is reviewed below.

a. Statewide

Statewide, a vast amount of land has been released from plantation agriculture: about 251,800 acres between 1968 and 2005, resulting in an average release of over 6,800 acres per year over a 37-year period (see Figure 11).[10,24] The 2006 Del Monte closure in Kunia increased this figure by another 4,400 acres, resulting in a total release of at least 256,200 acres from plantation agriculture between 1968 and 2007.[25,26] Over the 1968-to-2005 period, the demand for land for diversified crops increased by about 26,300 acres (about 10% of the land released from plantation agriculture).[10]

As the above figures indicate, the acreage released from plantation agriculture has far outpaced the demand for land for diversified crops. The net decrease in diversified crop land amounts to about 229,900 acres. While some of the released land has been converted or is scheduled to be converted to urban uses and tree plantations, an estimated 160,000+ acres remain available for diversified crops.[26] Because of the increased availability of agricultural land, a number of landowners report lower per-acre agricultural land rents on O'ahu and the Neighbor Islands compared to rents charged before the major contraction in plantation agriculture.[27]

If the Hawai'i Superferry is successful, cultivating crops on the Neighbor Islands for the Honolulu market, and vice versa, may become more economically feasible. For a full load carried in a large pick-up truck, the one-way fare will be about 2¢ per pound.[28] However, for some perishable crops, the ferry service may not be sufficiently frequent and/or delivery times may not be sufficiently rapid.

The above information indicates that considerable land is available in Hawai'i to accommodate the relocation of agricultural operations as well as the growth of diversified crop farming (see Sections 13 and 15).

AR00027544

b. O'ahu

On O'ahu, a similar release of plantation land occurred. Between 1968 and 2007, about 51,900 acres were released from plantation agriculture due to the contraction of five plantations and the closures of all but one of them.[10,26] About 32,700 acres were released after 1990. Much of this land remains available for agriculture, and most of it lies outside the County's Urban Growth Boundary.

The Kunia fields are considered to be among the best farm land in the State, based on the high solar radiation, high-quality soils, and the short trucking distance to the large Honolulu market, the airport, and Honolulu Harbor.[29] Except for lands recently released by Del Monte, all of the better Kunia fields have already been leased for diversified crop farming. However, on average, only about one-third of this land is in crop.[30] The large amount of fallowing reflects best management practices when farm land is abundant and land rents are relatively low. Fallowing increases soil fertility and helps control unwanted volunteer plants, weeds, insects and disease. When demand for farm land is strong and rents are high in response to a strong demand for agricultural products, then more intensive farming of the land may be warranted even if this increases farmers' costs for pest control and soil additives.

Of the estimated 4,400 acres of Kunia land recently farmed by Del Monte, about 3,200 acres remain available. The decrease was due to (1) Monsanto's land purchase in lower Kunia for seed crops, and (2) the U.S. Army's land purchase in upper Kunia for expanding Schofield Barracks. These two purchases involve considerable land, including about 640 acres and 580 acres, respectively, of former pineapple fields.[21,31]

Another possible land purchase could impact the future supply of farm land in Kunia. The Army Hawai'i Family Housing LLC (AHFH), a public/private partnership between the U.S. Army and Actus Lend Lease, plans to acquire about 2,520 acres in northern Kunia from Campbell, including about 1,570 acres of former pineapple land.[21,32] AHFH intends to "bank" the land for future needs, which will allow a portion it to be used for military housing if needed in the distant future. If and when AHFH proposes the land for development, the project will be subject to all State and County development approvals and permits, which could prove difficult since the development would be outside the County's existing Urban Growth Boundary. AHFH has indicated that if the land is purchased, it would remain in agriculture for the foreseeable future.

On the North Shore, various crops are being grown, but about 7,750 acres of the former sugarcane and pineapple lands remain fallow or are in a low-value use.[27,33]

In total, about 10,900 acres of former plantation land remain available on O'ahu for other crops, including about 3,150 acres of former pineapple land in Kunia plus the 7,750 acres on the North Shore. However, this excludes any adjustment for the farm land that is already leased for diversified crops but is not farmed intensively, some arable lands in the foothills that are used for grazing, and a portion of the 2,290 acres (about 1,600 acres arable) purchased by Monsanto that might remain available for crops other than seed crops.

Given the large release of land from plantation agriculture on O'ahu, the amount of available farm land that remains on O'ahu is lower than what might be expected. This is explained by: (1) farmers relocating to or expanding on these high-quality and favorably located lands, thereby reducing the amount of land farmed elsewhere on O'ahu and the Neighbor Islands; (2) extensive fallowing of fields that are under lease; (3) growth of seed operations on O'ahu; (4) transferring land in the foothills from farming to grazing because of the lower demand; (5) urbanization in 'Ewa and Central O'ahu; and (6) military use of some land.

Much of the available 10,900 acres have limitations for growing certain crops. Some limitations reflect permanent agronomic and other conditions. For example, the higher elevation fields in Kunia and on the North Shore have less solar radiation compared to 'Ewa: the average daily insolation is about 400 calories per square centimeter at higher elevations compared to as much as 500 calories in 'Ewa.[7] In addition, fields at higher elevations incur higher pumping costs, although rainfall reduces water requirements. Also, North Shore farmers encounter longer trucking distances to Honolulu markets, the airport, and the harbor.

Nevertheless, some limitations can be overcome with investment in improvements. For example, on the North Shore, portions of the water delivery systems need major repairs to address current leaks and to prevent future ones.[27,34] Because of the leaks, a number of mid-level and high-level fields on the North Shore can no longer be irrigated in the summer months. Also, the types of crops on fields irrigated with water from Wahiawa Reservoir (Lake Wilson) will be restricted as long as partially-treated wastewater continues to be discharged into the lake.[35] Water from the lake can be used to irrigate tree crops (e.g., papaya and coffee) and crops such as sugarcane that are processed sufficiently to kill pathogens. However, the water cannot be used to irrigate the wide variety of fresh vegetable crops that are now grown in 'Ewa and Kunia.

Regardless of the above difficulties, the available supply of farm land on O'ahu will be partially absorbed over time as island farmers expand production.

AR00027545

This expansion will reflect the advantages to them of farming fields near the large Honolulu markets, and near the State's primary transportation/distribution centers (i.e., Honolulu Harbor, Honolulu International Airport, and many companies involved in distributing goods inter-island and overseas).

13. Direct and Cumulative Impacts on the Affected Agricultural Operations

a. Loss of Land for the Affected Agricultural Operations

The Project will result in a direct loss of about 1,497 acres currently being leased for various agricultural operations. In combination with land lost to other State and private urban projects and to other agricultural uses, the four agricultural operations in the Petition Area will incur a cumulative loss of about 3,600 acres of their leased land (Section 10 and Table 3). The amount of arable land will be somewhat less. However, as noted above, it is expected that Syngenta will relocate for reasons unrelated to and before the Ho'opili construction begins.

b. Required Replacement Land

If Syngenta remains on O'ahu, then about 3,600 acres of replacement land will be needed on O'ahu by the four the affected agricultural operations. But, if Syngenta relocates its O'ahu activities to Kaua'i where most of its operations are located, then the O'ahu demand will be reduced by 740 acres (see Section 9.3), resulting in a need for less than 2,900 acres of replacement land.

Desired physical characteristics of replacement lands include: large gently-sloping fields, good soils, high solar radiation, and affordable irrigation water of sufficient quality to use on any type of crop.

As summarized in the previous section, sufficient land is available on O'ahu and the Neighbor Islands. Nevertheless, major water-related improvements are required before all available agricultural lands on the North Shore of O'ahu will be suitable for growing diversified crops. Also, the available lands possess different agronomic conditions than those found in 'Ewa and lower Kunia.

c. Direct On-site Agricultural Impacts

In isolation, Ho'opili will result in the gradual on-site loss of all agricultural activity in the Petition Area, along with the related gradual loss of approximately $6 million per year in revenues, an average employment of slightly under 80 jobs and about $1.7 million per year in payroll.

In practice, however, most or all of the agricultural operations on the Ho'opili land are expected to relocate to other lands (see the next subsection).

d. Anticipated Changes in Agricultural Operations

Until 2030, the agricultural operations located in the Petition Area are likely to adjust to gradual acreage losses by implementing a combination of the following:

— Leasing replacement lands

As discussed in the previous section, replacement lands are available in Kunia and on the North Shore, subject to (1) water-related improvements on the North Shore, and (2) adjustments that will have to be made by farmers to their crops and farming practices (see below).

— Cultivating remaining lands more intensively

Some farmers may be able to partially offset their acreage losses by fallowing less and keeping more of their land in crop. However, this may increase their costs for pest control and soil additives.

— Reducing operations

If the above two adjustments are not sufficient to offset future acreage losses, then farmers will have to reduce the sizes of their operations.

By 2030, however, Aloun Farms will lose nearly all and Fat Law's Farm will lose all their leased lands, thereby necessitating relocation to Kunia and/or the North Shore.

Assuming that the affected lessees secure replacement lands, and assuming the necessary water improvements are made, then the affected agricultural operations could maintain about the same level of production, sales revenues, employment and payroll. However, major adjustments in their operations will be required since the replacement lands will have different agronomic conditions (e.g., soils, temperature, solar radiation, and rainfall). Adjustments will include growing varieties that are more suitable to the replacement lands, modifying cultivation practices (which will take a few crop cycles to optimize), and changing the mix of crops if suitable varieties are not available. Also, the lessees will incur additional expenses to prepare the soils and irrigation systems for their particular crops, and to move their offices, and cooling and packing facilities.

AR00027546

If the agricultural operations lease replacement lands in Kunia, their trucking costs will be about the same. If they lease on the North Shore, then they will incur higher costs for hauling produce into Honolulu—costs that would be similar to what North Shore farmers pay, but lower than what Kahuku farmers pay. At the same time, the higher trucking costs could be partially offset by lower land rents on the North Shore as compared to those in Kunia.

If sufficient replacement land is not available on O'ahu due to the unlikely possibility that it will be used to grow an energy crop (explained in Section 15.a), then one or more of the farms could turn to a Neighbor Island. Potential feasibility is illustrated by the fact that two of the lessees already have agricultural operations on Neighbor Islands, while many Neighbor Islands growers supply O'ahu markets. However, the affected companies which may move to the Neighbor Islands will incur higher transportation costs, and delivery times will be longer. The costs and delays will be similar to those that Neighbor Island farmers now incur to supply the Honolulu market. In the future, these costs and delays may be somewhat lower because of the Superferry and the planned improvements to Interisland barge service. The disadvantages of a Neighbor Island location could be partially offset by lower rents. However, for some perishable crops, the ferry service may not be sufficiently frequent or travel may take too long.

e. Flexibility of Affected Agricultural Operations to Resize

Diversified crop farms such as those operating in the Petition Area generally can be flexible as to their size: profitability can be achieved with a farm that becomes smaller, stays about the same sizes, or becomes larger (provided the market can absorb additional product). This differs from the typical sugarcane plantation which relies on economies of scale to maintain economic viability.

Because the affected diversified crop operations can be flexible with regard to their sizes, it is anticipated that they will survive regardless of the amount of replacement land they lease in the future. More to the point, changes in available agricultural land due to the Project are not likely to threaten the survival of Aloun Farms, Fat Law's Farm, or Jefts Farms.

f. Statewide Impacts

From a Statewide perspective, the cumulative agricultural impact of the Project will be modest regardless of how the affected agricultural operations adjust to losing all, or portions of, their leased acreage. Their lost agricultural

production from the Petition Area and from other areas they now lease will be offset largely by (1) maintaining their current levels of operation and production by leasing replacement lands in Kunia and/or the North Shore, and possibly cultivating their remaining lands more intensively; (2) one or more of them relocating all or portions of their operations to a Neighbor Island; (3) other farmers on O'ahu and the Neighbor Islands increasing their production; or (4) some combination of the three.

Thus, it is likely that there will be little or no loss in Statewide agricultural production, revenues, employment or payroll.

g. Urbanization of Agricultural Lands

Reconfigurations of farms such a those described above are common and appropriate when agricultural operations lease land in the path of planned urban expansion. For the affected operations, much of the land they lease is located in areas that the County and, for much of the 'Ewa Plain, the State have designated for eventual expansion of Kapolei. Also, all current tenants entered into lease agreements with this knowledge and, except for Fat Law's Farm, have benefited from rents that are now below market.

For diversified crop farmers who supply nearby markets, locations on the edge of town can be ideal for them because of the lower trucking costs. And until these lands are urbanized, the best "temporary" use of them may be agriculture—a use that may last decades. For example, the affected operations have cultivated their acreage on the 'Ewa Plain for 10 years or more, and some of this land will probably remain available to them for agriculture until as late as 2030.

But when urbanization does occur, the operations will incur the expense and disruption of relocating all their operations or major portions of them to other lands. Since lessees only have temporary rights to the land, the costs of relocating falls on the farmers and are not an obligation of the landowners. If the costs were an obligation of the landowners, they would avoid leasing their land to crop farmers and put their land in a lower value agricultural use such as cattle grazing which has similar land-management and property-tax benefits.

h. Mitigating Measures

The mitigation measures recommended below will contribute to the successful relocation of the four agricultural operations that will be displaced by Ho'opili in combination with other land-use changes in 'Ewa, lower Kunia and Central O'ahu. They are designed to (1) address water issues that limit crop

AR00027547

production on the North Shore where most available farm lands on O'ahu are located, and (2) provide sufficient time to make the necessary improvements and arrangements for relocating.

The recommended mitigation measures are categorized by those which may be best implemented by government, and those which are within the purview of D.R. Horton:

— Government

- Upgrade the Wahiawa Wastewater Treatment Plant (WWTP) to treat wastewater to the State's R-1 standard, or eliminate discharging wastewater into the Wahiawa Reservoir.

  This recommendation to the County is consistent with a 1998 Consent Decree with the U.S. Environmental Projection Agency (EPA). Its purpose is to allow farmers to use water from the Wahiawa Reservoir to irrigate any type of crop using any type of irrigation system.

  Until the quality of the reservoir water is improved, most of the available agricultural land on the North Shore cannot be used to grow the types of vegetable crops the farmers grow in 'Ewa and lower Kunia. In turn, one or more agricultural operations that will be displaced by Ho'opili and by other projects may not be able to fully relocate to the North Shore until the improvements are made (assuming that relocating to the North Shore is their best option).

- Repair the Wahiawa Irrigation System (WIS)

  Repairs to portions of the WIS are needed to address major and minor leaks and to prevent future leaks. Because of the leaks, a number of mid-level and high-level fields on the North Shore can no longer be irrigated in the summer months with water from Wahiawa Reservoir. Until these repairs are made and more fields can be irrigated reliably, one or more agricultural operations being displaced by Ho'opili and by other projects may not be able to fully relocate to the North Shore (assuming that relocating to the North Shore is their best option).

  Because of the high cost of the repairs, State and Federal funds may be required.

— D.R. Horton

- To the extent possible, coordinate the development of Ho'opili with the affect agricultural operators and with developers of adjacent lands so as to maintain farming in 'Ewa for as long as possible.

  The development of Ho'opili and of projects on adjacent State lands could continue until 2030. Until then, farming can continue in 'Ewa, provided that Ho'opili works with the agricultural operators and developers of adjacent land to: (1) maintain access to fields and irrigation water, and (2) phase development to minimize the potential for nuisance issues (discussed in the next section). This will allow more time for others to make the necessary improvements to the WWTP and the WIS.

- Continue to lease agricultural land at below-market rents.

  The affected agricultural operators will have to make frequent adjustments to their operations as development proceeds. These adjustments may include contracting their 'Ewa operations, rearranging water systems, building berms to reduce nuisance problems, etc.

  Continued below-market rents will allow the affected agricultural operators to retain more funds to help finance the required adjustments.

14. NUISANCE ISSUES

a. Potential for Nuisance Issues

Nuisances arising from agricultural operations can become an issue for both residents and farmers. Residents who live close to and downwind from agricultural operations may complain about occasional noise, dust, chemical spraying, etc. In turn, the farmers may have to change their operations in order to address these complaints.

Regarding the existing homes that are located downwind of the agricultural operations in the Petition Area, they are buffered from nuisance problems by (1) farming activities on State land, (2) fallow fields on State land, and (3) the Kapolei Golf Course.

However, nuisance issues could arise during the 20 or so years while agricultural operations continue in portions of the Petition Area and homes are built

AR00027548

and occupied nearby as part of Ho'opili or other projects on adjacent State lands.

Once Ho'opili and adjacent lands are fully developed, nuisance issues arising from agricultural activities will not occur since the lands will no longer be cultivated.

b. Mitigating Measures

To mitigate potential nuisance issues related to agricultural activities near newly built homes, the following mitigation measures are recommended:

- To the extent possible—and subject to transit alignment, water and other infrastructure improvements—phase the development of homes and coordinate agricultural leases to provide wide separations between homes and upwind agricultural activities.
- For each phase of development of Ho'opili and nearby projects, require farmers to provide a buffer of fallow fields and berms upwind of the homes before the homes are occupied.
- As necessary, limit agricultural activities (restricted hours of operation, restricted plowing and use of chemicals on windy days, etc.) so as to avoid or minimize nuisance problems.
- As long as agricultural operations continue in the Petition Area and on adjacent lands, inform home buyers in the area that they will be living near agricultural activities.

15. GROWTH OF DIVERSIFIED CROPS

The Project will commit about 1,554 acres of agricultural land to a non-agricultural use, of which about 1,375 acres are arable. The impact of this commitment on the growth of diversified crops is addressed below. The material covers the (1) amount of land required for the growth of diversified crops, (2) the adjusted supply of land available for the growth of diversified crops, (3) impact of the Project on the growth of diversified crop farming, and (4) mitigating measures.

a. Potential Acreage Requirements for Diversified Crops

Crops to Replace Imports of Fruits and Vegetables[36]

For low-elevation fruits and vegetables that have a history of profitable production in Hawai'i, potential land requirements in 2010 for 100% import substitution for the Hawai'i and O'ahu markets are estimated at 12,700 acres and 8,600 acres, respectively, plus additional acreage for fallowing land between crop plantings. When allowing for competition from imports, these estimates drop to about half. These estimates take into account estimated consumption, production trends, seasonal and annual market shares, yields, and the number of crops per year. Also, these figures are for acreage in crop—not harvested acreage as is typically reported in government publications.

For many crops grown in Hawai'i, market shares for Hawai'i growers are limited by the following factors: (1) local varieties are not perfect substitutes for all imports (e.g., premium-priced sweet Maui onions versus inexpensive storage onions); (2) some crops cannot be produced profitably in the Summer due to competition from low-cost imports of fruits and vegetables from California, other states, and Mexico; and (3) over-production must be avoided in order to maintain profitable price levels.

Since Hawai'i farmers already supply a portion of the Hawai'i market, land requirements for increased import substitution are a fraction of the above estimates.

Export Crops[10,37,38]

The potential market for export crops is far larger than the Hawai'i market. In 2005, the U.S. population was 296.41 million, compared to Hawai'i's resident-plus-visitor population of 1.45 million. To take advantage of this large potential, Hawai'i farmers are exploring various export crops on lands released from plantation agriculture. Over the next 20+ years, one or more of these crops may prove to be successful and may grow into a major export crop.

However, the history of agricultural efforts in Hawai'i reveals that the successful development of major new export crops requiring large amounts of land is difficult and infrequent. For example, over the past 50 years in Hawai'i, farmers have explored numerous possibilities for export crops, but they have developed overseas markets for just one diversified crop that requires more than 10,000 acres (macadamia nuts at 18,300 acres in 2005); one additional crop that requires more than 5,000 acres (coffee at 8,000 acres); and only five additional crops or crop categories that require more than 1,000 acres each (papaya at 2,395 acres, bananas at 1,145 acres, tropical specialty fruits at 1,230 acres, flowers/nursery products at 3,895 acres, and seed crops at 4,220 acres). Tropical specialty fruits include longan, lychee, mango, rambutan, star-fruit, etc.

At 4,220 acres in 2005 and growing at an average rate of 264 additional acres per year, the seed industry is expected to soon become only the third diversified crop that requires more than 5,000 acres. The fourth crop could be nursery and flower products: 3,895 acres and increasing at 235 acres per year.

AR00027549

Feed Crops[29]

If feed crops could be grown in Hawai'i and priced competitively against mainland imports, they could replace some of the grains and hay that are now being imported to the State. Unfortunately, a number of commercial attempts in Hawai'i to grow grains and alfalfa have been unsuccessful. The major problems have been (1) pests, particularly birds that eat the grains before they are harvested; (2) humidity that is too high for drying alfalfa properly; and (3) high production costs compared to those of mainland farms.

Biofuel Crops

Crops can be grown to produce biomass to fuel a boiler, or as feedstock to produce fuels. Examples of the latter include sugarcane, corn, or sorghum used to produce ethanol. In turn, the ethanol is used to produce E-10 gasohol (90% gasoline and 10% ethanol). Also, palm oil, soybean, sunflower, kukui nut, avocado, coconut, neem and other crops can be grown to produce biodiesel.[39]

In Hawai'i, the common practice has been to produce biomass as a by-product of some principal crop. For example, at HC&S on Maui and at Gay & Robinson on Kaua'i, the sugarcane by-product bagasse is burned to help fuel their respective power plants. In addition, the biofuel company Maui Ethanol plans to use the sugarcane by-product, molasses, from the two sugarcane plantations as feedstock to produce ethanol.[40,41] Using conventional technology, the sugar in the molasses will be fermented to produce ethanol, followed by distillation to extract the alcohol.

However, O'ahu Ethanol Corporation plans to build an ethanol plant at Campbell Industrial Park using conventional technology but, at least initially, using imported molasses as the feedstock.[40,42] The rated capacity will be 15 million gallons of ethanol per year. For the longer term, this company is exploring the economics of growing sweet sorghum to supply feedstock to its ethanol plant. The sorghum would have to be grown on O'ahu because it would be too expensive to ship the sorghum juice from a Neighbor Island to O'ahu. Sorghum juice is mostly water having a low concentration of sugar compared to molasses. Acreage requirements for a new sorghum biofuel plantation on O'ahu would range from about 6,000 acres for viability to 15,000 acres if juice from sorghum were to replace all imported molasses.[32] This acreage comprises a substantial share, if not all, of the estimated 10,900 acres of crop land that is available on O'ahu as of mid-2007. But it is a small share of the 160,000+ acres of crop land available Statewide (see Section 11.b).

Also, Imperium Renewables Hawai'i LLC is proposing to build by 2009 a biodiesel refinery on State land at Kalaeloa Harbor; it would produce about 100 million gallons of biodiesel annually.[43,44] Similarly, BlueEarth Maui Biodiesel LLC plans to build a similar refinery on Maui that would produce about 120 million gallons annually by 2011. Both will use imported palm oil from Malaysia and other countries as their feed stock, but would refine locally produced vegetable oil if available.

A number of substantial difficulties must be overcome in order to develop one or more biofuel plantations to supply feedstock for ethanol or biodiesel production, including:

— Long-term Leases

In many areas of the State, it will be difficult to lease the large amount of land required for a biofuel plantation at low lease rents for the 30 or so years required to capitalize the investment in a new plantation. Over time, other farmers and other users of land are likely to make higher offers to landowners of lease rents or land purchases. In view of this potential for landowners, the current market value of available farm lands is likely to be higher if landowners do not commit long-term to rents that are low enough to be affordable to a biofuel plantation.

— Capital

Substantial investment capital will be required to cover the cost of improvements and equipment such as: a mill to extract the juice from a biofuel crop; a generating plant to provide power; improvements and upgrades to irrigation systems that are in disrepair; trucks and equipment to harvest and haul harvested plants to the mill, and haul the extracted juice to an ethanol plan or the vegetable oil to a refinery, etc.

— Short-term Profitability

Annual revenues from selling the ethanol plus direct subsidies are estimated by the consultant at about $2,430 per acre (based on an estimated 900 gallons per acre per year of ethanol at about $2.70 per gallon). Even with subsidies, this is low compared to revenues from other crops in Hawai'i. Per-acre returns from biodiesel crops are even less.

Furthermore, the cost of importing molasses or palm oil for feedstock, or importing ethanol may prove to be less expensive

AR00027550

than growing a biofuel crop in Hawai'i. For similar crops (such as feed crops), importing has proven to be less expensive than growing and processing crops locally. Also, the U.S. Department of Agriculture has found sorghum to be an expensive feedstock for producing ethanol—about 3.7 times more expensive than corn and 63% more expensive than molasses.[15]

As ethanol production increases on the mainland and in Hawai'i, there is a risk that the combined Federal and State subsidies for ethanol (over $2 per gallon) could be reduced, thereby compromising the profitability of a biofuel crop.

— Long-term Profitability

Over the long-term, emerging technology holds promise for a cheaper source of feedstock for ethanol than does growing a biofuel crop on a plantation.[16] Instead of producing ethanol using sugars from conventional sources (e.g., molasses, sugarcane, grains, fruits, etc.), the sugar would come from "cellulosic" sources. Using new technology that is in the early stages of commercialization, sugar that is locked in complex carbohydrates of plants is separated into fermentable sugars. Feedstock would include agricultural wastes, yard clippings, discarded paper, wood waste, etc.—i.e., the green waste that is now used for composting. This new technology promises (1) much higher ethanol yields per ton of biomass because the entire plant can be used as feedstock, and (2) lower costs—particularly if there are no growing costs when waste product is used, and if the operator is paid a fee to dispose of municipal and agricultural waste. Eventually, this less expensive source of feedstock could result in unprofitable biofuel plantations. In Hawai'i, this new technology is being explored by ClearFuels Technology Inc.

O'ahu's municipal waste could produce an estimated 160 million gallons of ethanol compared to the current annual consumption of about 400 million gallons of gasoline.

The above difficulties and risks suggest that the probability of successfully developing and sustaining a biofuel plantation in Hawai'i is low. The more likely scenario is that ethanol will be produced as a by-product of sugar and, over the long-term, it will be produced from green waste.

Recent Crop-acreage Trends[19]

For all diversified crops (i.e., all crops other than sugarcane and pineapple, including crops to replace imports and crops for export) Statewide land requirements grew as shown in Figure 11, with the annual growth by selected periods summarized as follows:[1,2]

— 1963 to 1979: about 839 acres per year.

— 1979 to 1983: about 3,450 acres per year.[1]

— 1983 to 2000: about 310 acres per year.[2]

— 2000 to 2005: about 160 acres per year.

As the above illustrates, growth in acreage of diversified crops has slowed over time.

Regarding major export crops and crop categories, acreage increased for four of them from 2000 to 2005: coffee up an average of 20 acres per year; tropical specialty fruits up 54 acres per year, flowers/nursery products up 235 acres per year, and seed crops up 264 acres per year. During this same period, acreage declined for three of the major export crops: macadamia nuts down an average of 20 acres year, papaya down 90 acres per year, and bananas down 113 acres per year. The net change was an average increase of 350 acres per year.

Regarding crops grown for the Hawai'i market, acreage declined by an average of 190 acres per year from 2000 to 2005.

In summary, the major growth in acreage for diversified crops from 2000 to 2005 came from just two crop categories: seed crops and flowers/nursery products.

These trends are consistent with advances in economic development, transportation and overseas trade. In essence, communities increase their standard of living by increasing their economic specialization and their trade with other communities.

1. In Figure 11, the rapid growth in diversified-crop acreage that occurred during the 1979-to-1983 period largely reflects (1) growth in macadamia-nut acreage which continued until about 1986 when tax-shelter advantages were terminated, and (2) a temporary increase in feed-crop acreage that declined after 1983 and offset the acreage gains in macadamia nuts. The growth in feed-crop acreage may reflect the situation addressed in Footnote 2.

2. In Figure 11, the temporary bump in diversified-crop acreage that occurred in the late 1990s reflects the fact that some former sugarcane fields were newly planted with grasses for future cattle grazing. After cattle grazing began in 2000, much of this acreage was recategorized by NASDA from crop land to grazing land.

AR00027551

Factors Limiting the Growth of Diversified Crops[35]

A great many crops can be grown in Hawai'i's year-round subtropical climate, and a number of them can be grown profitably in volumes that require a few hundred acres. However, the modest growth in land requirements for diversified crops reflects the fact that few crops can be grown profitably on a large scale. The primary factors that have limited the growth of diversified agriculture in Hawai'i are given below:

- Hawai'i's subtropical climate is not well-suited to the commercial production of major crops that grow better in the temperate mainland climates.
- For certain crops, special hybrids adapted to Hawai'i's subtropical climate are yet to be developed.
- Crop pests are more prevalent and more expensive to control in Hawai'i than they are on the mainland where the cold winters kill many pests.
- Fruit-fly infestations prevent exports of many crops, or require expensive treatment.
- Most soils in Hawai'i have low nutrient levels and therefore require high expenditures for fertilizer.
- Hawai'i suffers from high farm-labor costs, largely because the agriculture industry must compete against the visitor industry and related industries for its labor.
- Compared to many other farm areas that supply U.S. markets, the cost of shipping agricultural supplies and equipment to Hawai'i is high, as is the cost of exporting produce from Hawai'i to mainland markets. High shipping costs are a result of Hawai'i's remote location and to Federal regulations that require use of American-built ships and U.S. crews between U.S. ports.
- For a number of crops, consumption volumes in Hawai'i are too small to support large, efficient farms (i.e., the volumes are too small to realize economies of scale).
- On-going trends towards food suppliers purchasing produce that is certified as safe and towards buying from a single supplier of many food items favor large farms.
- Hawai'i farmers must compete against highly efficient mainland and foreign farms which, in a number of cases, can deliver produce to Hawai'i more cheaply than it can be produced locally. This is due to economies of scale and, in comparison to Hawai'i, low costs for land, labor, supplies, fertilizer, pest control, equipment, etc.

b. Adjusted Supply of Land Available for the Growth of Diversified Crops

As discussed Section 12, about 10,900 acres of farm land are available on O'ahu, and over 160,000 acres are available Statewide. Over time, a portion of this available land supply will be leased to the four agricultural operations that will have to relocated as a result of Ho'opili in combination with other land-use changes in 'Ewa, lower Kunia, and Central O'ahu. As discussed in Section 13, the relocation will require about 2,900 to 3,600 acres, depending on whether Syngenta's O'ahu operation remains on O'ahu or relocates to Kaua'i. The adjusted supply of farm land that will remain available for diversified farming will total about 7,300 to 8,000 acres on O'ahu and over 156,000 acres Statewide.

This adjusted supply of available farm land far exceeds the amount of land that will be needed to accommodate the growth of diversified crops, whether demand is based on potential or recent trends. This indicates that the limiting factor to the growth of diversified crops will *not* be the *land supply*. Instead, growth will be limited by the *size of the market* for crops that can be grown *profitably* in Hawai'i.

c. Impact on the Growth of Diversified Crop Farming

The development of Ho'opili—in combination with other development projects in 'Ewa, Central O'ahu and elsewhere—involves the loss of too little good agricultural land to significantly affect the growth of diversified crop farming in Hawai'i. This conclusion is based on the above finding that ample land will remain available for diversified crops, with the available supply far exceeding the likely or potential demand.

However, as discussed in Subsections 12.b and 13.h, water-related improvements are needed to allow full use of some of the available farm lands on the North Shore. These improvements are the responsibility of the landowners and government agencies.

d. Mitigating Measures

In view of the negligible impact of the Project on the growth of diversified agriculture, mitigation measures for the loss of good agricultural land are not recommended beyond the measures in Section 13.h.

AR00027552

16. OFFSETTING BENEFITS

As previously mentioned, Ho'opili will commit about 1,554 acres of agricultural land to a non-agricultural use, of which about 1,375 acres are arable. In turn, Ho'opili—in combination with other private and State urban projects and changes in agriculture land use in Kunia—will require the the affected agricultural operations to relocate.

These adverse impacts to agriculture will be offset by the following benefits of the Project:

- About 11,750 homes for Hawai'i residents, along with business and commercial space, light-industrial space, parks and open space, and public facilities.
- For 'Ewa, relatively high housing densities which, in turn, will contribute to slower urbanization of agricultural land than would be the case with lower densities.
- Construction jobs provided by the development activity.
- At full development of the Project, on-site jobs provided by business, commercial, industrial, and home-service activities.
- Tax revenues (excise taxes, personal income taxes, corporate income taxes, property taxes, etc.) generated by the development activity.
- Tax revenues generated by the families and businesses that occupy the Project.
- Improved land and partial funding for schools, parks and other public facilities.

17. CONSISTENCY WITH STATE AND COUNTY POLICIES[47]

a. Availability of Lands for Agriculture

The *Hawaii State Constitution*, the *Hawaii State Plan*, the *State Agriculture Functional Plan*, and the *General Plan of the City and County of Honolulu* call directly or implicitly for preserving the economic viability of plantation agriculture and promoting the growth of diversified crops. To accomplish this, an adequate supply of agriculturally suitable lands and water must be assured.

With regard to plantation agriculture, the Petition Area is no longer part of a sugar plantation since O'ahu Sugar Co. closed in 1995 for reasons unrelated to the Project.

With regard to diversified crops, development of the Petition Area will result in a loss of good farm land, and the farms on this land will have to relocate. However, this loss of agricultural land will not limit the growth of diversified crops since ample agricultural land is available on O'ahu and on other islands. This is due to the enormous supply of farm land that is now available following the contraction of plantation agriculture (see Section 15 and Figure 11). However, improvements to the WWTP and the WIS will be needed to allow full use of the available farm lands on the North Shore.

b. Conservation of Agricultural Lands

In addition to the above, State policies call for conserving and protecting prime agricultural lands, including protecting agricultural lands from urban development.

However, these policies—which were written before the major contraction of plantation agriculture in the 1990s—assume implicitly that profitable agricultural activities eventually will be available to use all available agricultural lands. This has proven to be a questionable assumption in view of the enormity of the contraction of plantation agriculture, the abundant supply of land that came available for diversified agriculture, and the slow growth in the amount of land being used for diversified crops (see Section 15 and Figure 11).

Furthermore, discussions in the Agriculture portion of the *State Functional Plan* recognize that redesignation of lands from Agricultural to Urban should be allowed "... upon a demonstrated change in economic or social conditions, and where the requested redesignation will provide greater benefits to the general public than its retention in ...agriculture;" that is, when an "overriding public interest exists." In this regard, major changes in economic and social conditions have occurred as a result of:

- The on-going development of the City of Kapolei and the surrounding 'Ewa region as the second largest urban center in Hawai'i (see the policy discussion in the following subsection).
- Inadequate expansion in the supply of workforce housing which has contributed to high housing prices on O'ahu.
- The enormous contraction in plantation agriculture which has resulted in the supply of agricultural land far exceeding demand.

Moreover, development in the Petition Area will provide community benefits (about 11,750 homes and many on-site jobs) that far exceed those provided by agriculture (about 80 jobs after Syngenta is replaced by a new farm). In prac-

AR00027553

tice, however, development of the Petition Area is likely to have little or no impact on Statewide agricultural employment.

c. County 'Ewa Development Plan

As shown in Figure 4, the Petition Area is within the County's designated Urban Growth Boundary of the 'Ewa Development Plan in an area designated for residential development. Thus, the Project is consistent with the 'Ewa Development Plan in terms of future land use.

This Plan is part of a broader long-established County policy, with support from the State, to direct urban growth to 'Ewa, to portions of Central O'ahu, and to the primary urban center. In turn, the policy reduces development pressures on the outlying Districts of Ko'olau Loa, Ko'olau Poko, North Shore, and Wai'anae. The policy was designed to provide needed housing, jobs, and commercial and industrial space in compact areas; preserve agricultural lands and open space in Kunia, the North Shore, and outlying areas; preserve the "country" lifestyle of rural communities; and reduce the cost of providing government infrastructure and services.

Portions of the Project could be inconsistent with the phasing component of the currently approved 'Ewa Development Plan which indicates that urban expansion of the northern and eastern portions of the Petition Area is to occur after 2015. This area includes all the fields farmed by Aloun Farms that are between Farrington Highway and the H-1 Freeway, the eastern portion of Aloun lands that are subleased to Fat Law's Farm, and all the lands farmed by Syngenta (see Figure 10). Such phasing in the current 'Ewa Development Plan would create nuisance issues by placing farm areas immediately upwind of the new Ho'opili homes (see Section 14). However, the 'Ewa Development Plan is in the process of being updated which, based on discussions with the County, is expected to reflect the removal of phasing from the Plan.

APPENDIX:
SELECTED STATE AND COUNTY GOALS, OBJECTIVES, POLICIES AND GUIDELINES RELATED TO AGRICULTURAL LANDS

1. HAWAI'I STATE CONSTITUTION (Article XI, Section 3):

   ...to conserve and protect agricultural lands, promote diversified agriculture, increase agricultural self-sufficiency and assure the availability of agriculturally suitable lands...

2. HAWAI'I STATE PLAN (Chapter 226, Hawaii Revised Statutes, as amended):[1,2]

   Section 226-7 Objectives and policies for the economy--agriculture.

   (a) Planning for the State's economy with regard to agriculture shall be directed towards achievement of the following objectives:

      (1) Viability in Hawaii's sugar and pineapple industries.

      (2) Growth and development of diversified agriculture throughout the State.

      (3) An agriculture industry that continues to constitute a dynamic and essential component of Hawaii's strategic, economic, and social well-being.

   (b) To achieve the agricultural objectives, it shall be the policy of the State to:

      (2) Encourage agriculture by making best use of natural resources.

      (10) Assure the availability of agriculturally suitable lands with adequate water to accommodate present and future needs.

      (16) Facilitate the transition of agricultural lands in economically nonfeasible agricultural production to economically viable agricultural uses.

   Section 226-103 Economic priority guidelines.

   (c) Priority guidelines to promote the continued viability of the sugar and pineapple industries:

      (1) Provide adequate agricultural lands to support the economic viability of the sugar and pineapple industries.

   (d) Priority guidelines to promote the growth and development of diversified agriculture and aquaculture:

      (1) Identify, conserve, and protect agricultural and aquacultural lands of importance and initiate affirmative and comprehensive programs to promote economically productive agricultural and aquacultural uses of such lands.

      (10) Support the continuation of land currently in use for diversified agriculture.

   Section 226-104 Population growth and land resources priority guidelines.

   (b) Priority guidelines for regional growth distribution and land resource utilization:

      (2) Make available marginal or non-essential agricultural lands for appropriate urban uses while maintaining agricultural lands of importance in the agricultural district.

   Section 226-106 Affordable Housing

   Priority guidelines for the provision of affordable housing:

      (1) Seek to use marginal or nonessential agricultural land and public land to meet housing needs of low- and moderate-income and gap-group households.

3. AGRICULTURAL STATE FUNCTIONAL PLAN (1991)[3]
   (Functional plans are guidelines for implementing the State Plan. They are approved by the Governor, but not adopted by the State Legislature.)

   Objective H: Achievement of Productive Agricultural Use of Lands Most Suitable and Needed for Agriculture.

   Policy H(2): Conserve and protect important agricultural lands in accordance with the Hawaii State Constitution.

      Action H(2)(a): Propose enactment of standards and criteria to identify, conserve, and protect important agricultural lands and lands in agricultural use.

      Action H(2)(c): Administer land use district boundary amendments, permitted land uses, infrastructure standards, and other planning and regulatory functions on important agricultural lands and lands in agricultural use, so as to ensure the availability of agriculturally suitable lands and promote diversified agriculture.

AR00027562

4. CITY AND COUNTY OF HONOLULU GENERAL PLAN, Objectives and Policies (Resolution No. 87-211)[4]

Economic Activity

Objective C. To maintain the viability of agriculture on Oahu.

Policy 1. Assist the agricultural industry to ensure the continuation of agriculture as an important source of income and employment.

Policy 2. Support agricultural diversification in all agricultural areas on Oahu.

Policy 3. Support the development of markets for local products, particularly those with the potential for economic growth.

Policy 4. Provide sufficient agricultural land in Ewa, Central Oahu, and the North Shore to encourage the continuation of sugar and pineapple as viable industries.

Policy 5. Maintain agricultural land along the Windward, North Shore, and Waianae coasts for truck farming, flower growing, aquaculture, livestock production, and other types of diversified agriculture.

Policy 6. Encourage the more intensive use of productive agricultural land.

Policy 7. Encourage the use of more efficient production practices by agriculture, including the efficient use of water.

Policy 8. Encourage the more efficient use of nonpotable water for agricultural use.

5. CITY AND COUNTY OF HONOLULU 'EWA DEVELOPMENT PLAN[5]

3.1. Open Space Preservation and Development

3.1.1 General Policies

Open space will be used to:

- Provide long range protection for diversified agriculture on lands outside the Urban Growth Boundary.

INTRODUCTION

This report includes the findings of a botanical study conducted within the Honouliuli Region on the island of Oahu, Hawaii. LeGrande Biological Surveys Inc. carried out a botanical field survey of the above location on January18, 19, 23, 24, 30, and 31, and May 6 and 7, 2006, for a total of 8 field days. The primary objectives of the field studies were to:

1) provide a general description of the vegetation on the project site;
2) inventory the flora; and
3) search for threatened and endangered species as well as species of concern.

Federal and State of Hawaii listed species status follows U.S. Fish and Wildlife (USFWS) (1999a and 1999b, 2004) and Federal Register (2002).

GENERAL SITE DESCRIPTION

The area proposed for the Ho'opili Project in Ewa includes three main parcels (covered in this report) and two smaller "Off-Site" areas (separate reports). The main parcels covered in this report include: [A] a rectangular section to the west of Palehua Road, between H-1 Freeway and Farrington Highway (TMK 9-1-18:04);[B] a strip running east-west between H-1 Freeway (to the north) and Farrington Highway (to the south) (TMK 9-1-18:01); and [C] the largest parcel bordered by Farrington Highway to the north, Old Fort Weaver Road to the east, Mango Tree Road to the south, and Palehua Road and the new North-South Road to the west (TMK 9-1-17:04 (por.), 9-1-17:59, and 9-1-17:72). The entire area surveyed (and described in this report) encompasses approximately 1,555 acres

The majority of the surveyed area is either in active cultivation or cleared to bare dirt substrate. The edges of the agricultural fields along with a few small gulches harbor most of the plant diversity. Weedy plant species dominate all areas. The subject property ranges in elevation from near sea level to 250 ft. The Ho'opili parcels have been utilized for agriculture for some time, being planted in sugar cane in the past and now in diversified agriculture. Alteration of native plant habitat has been in place for some time and few of the natural plant elements remain.

SURVEY METHODS

Prior to undertaking the field studies, a search was made of the pertinent literature to familiarize the principal investigator with other botanical studies conducted in the general area. The 2004 Habitat Conservation Plan for *Abutilon menziesii* at Kapolei was reviewed for possible endangered plant locations within the survey area. Information from the Hawaii Biodiverstiy & Mapping Program database was reviewed. Topographic maps were examined to determine terrain characteristics, access, boundaries, and reference points.

AR00027565

A walk-through survey method was used. The boundaries of all five parcels were surveyed by foot. Roads through the subject property were driven and most were walked as well to survey for roadside plants. Transects on an average of 80 ft apart were surveyed on foot by 2 botanists for the parcel interiors, except in areas where active cultivation was in progress (i.e. cornfields were surveyed from the outer margins.). Special attention was paid to gulch areas and areas that contained scrub vegetation with native plant elements. Notes were made on plant associations and distribution, disturbances, topography, substrate types, exposure, drainage, etc. Plant identifications were made in the field. Plants that were not positively identified were collected for later determination, and for comparison with the recent taxonomic literature.

DESCRIPTION OF THE VEGETATION

The entire survey area is dominated by non-native plant species and agricultural crops. A total of 137 plant species were observed within the survey area. 133 are alien (introduced) and four are indigenous (native to the Hawaiian Islands and elsewhere). Therefore, 97% of the plant species observed were alien and only 3% native.

An inventory of all the plants observed within the five survey areas is presented in the species list at the end of the report.

TMK 9-1-18:04 [A]

This parcel is located between H-1 and Farrington Highway west of Palehua Road with Hunehune Gulch bordering the parcel to the west. The majority of the parcel is either cleared land or planted in corn. The edges of the parcel, including Palehua Road are dominated by weedy species such as, castor bean (*Ricinus* communis), lion's ear (*Leonotis nepetifolia*), partridge pea (*Chamaecrista nictitans*), and kikania (*Xanthium strumarium* var. *canadense*). A few kiawe (*Prosopis pallida*) and opiuma (*Pithecellobium dulce*) trees are scattered along the top of the gulch. Grass species throughout the parcel include natal redtop, sourgrass (*Digitaria insularis*), and swollen fingergrass (*Digitaria insularis*).

TMK 9-1-18:01 [B]

This parcel is a strip running east-west between H-1 Freeway (to the north) and Farrington Highway (to the south) with Fort Weaver Road bordering to the east. Aloun Farms baseyard is located within this section. The majority of this section consists of gently sloping agricultural fields planted with corn. Edges of fields and along roadsides were generally low-growing weedy shrubs dominated by koa haole, Christmas berry (*Schinus terebinthifolius*), sourbush (*Pluchea carolinensis*), castor bean, and guinea grass.

Honouliuli Gulch runs north-south through this section. The gulch is characterized by koa haole scrub at the northern (upper) sections. Along with koa haole and guinea grass as the dominant species several tall tree species reside in the gulch including kukui (*Aleurites moluccana*), kiawe, pride of India (*Melia azerdarach*), and autograph tree (*Clusia rosea*). Lower down the bottom of the gulch has been cleared for a banana (*Musa sp.*) patch that is currently in cultivation. At the lowest point of the gulch where it crosses Farrington Highway several morning-glory species were observed, koali ai (*Ipomoea cairica*), little bell (*I. Triloba*), and *I. obscura*. Primrose willow (*Ludwigia octovalvis*), love-in-a-mist (*Passiflora foetida*), and comb hyptis (*Hyptis pectinata*) were observed in the drainage.

The Aloun baseyard is planted with various cultivars including citrus (*Citrus sp.*), noni (*Morinda citrifolia*), kalo (*Colocasia esculenta*), yellow Poinciana (*Peltophorum pterocarpum*), sugarcane (*Saccharum officinarum*), and lemon grass (*Cymbopogon citratus*). The electric power substation has a hedge of tropical coral tree (*Erythrina variegata*) planted along the fenceline. Along Farrington Highway the vegetation is dominated by non-native grass species with kiawe, monkeypod (*Samanea saman*) trees and bougainvillea (*Bougainvillea sp.*) scattered along the length of the parcel.

TMK 9-1-17:04, 9-1-17:59, & 9-1-17:72 [C]

This is the largest section of the subject property, bordered by Farrington Highway to the north, Old Fort Weaver Road to the east, Mango Tree Road to the south, and Palehua Road and the new North-South Road to the west. The majority of this portion of the surveyed area is under cultivation or cleared to bare soil. Crops observed grown in this area include corn, melons (*Cucumis sp.*), basil (*Ocimum sp.*) and bananas. At the edges of planted areas and in fallow fields weedy species such as kili oopu (*cyperus rotundus*), wild spider flower (*Cleome gynandra*), and cheeseweed (*Malva parviflora*) were observed. There are several flumes running east-west through the property, they have a greater number of plant species due to the availability of water. The flumes are dominated by koa haole and guinea grass with other non-native plant species scattered within the site including, boerhavia (*Boerhavia coccinea*), Australian saltbush (*Atriplex semibaccata*), heliotrope (*Heliotropium procumbens*), coat buttons (*Tridax procumbens*), and slender mimosa (*Desmanthus pernambucans*). Along the flumes there are some larger woody species such as Christmas berry (*Schinus terebinthifolius*), fleabane (*Pluchea* x *fosbergii*), Chinese banyan (*Ficus microcarpa*), and a few mango (*Mangifera indica*) trees. The only indigenous plant species observed within the site are uncommon and include: ilima (*Sida fallax*) and scattered individuals of popolo (*Solanum americanum*) and uhaloa (*Waltheria indica*).

Between the fairly level agricultural fields and Old Fort Weaver Road, the property changes elevation quite drastically, there is a cliff approximately 20 to 30 feet high running the length of the eastern boundary. The majority of the cliff area is dominated by kiawe forest with an understory of guinea grass. Along the top of the cliff where the cultivated fields do not extend to the edge of the cliff, there are pockets of shrub vegetation that contain a few native plant species such as, ilima, uhaloa, and popolo. At the bottom of the cliff faces there are areas of flat land that extend to Old Fort Weaver Road. These areas are being utilized for various purposes including automobile parking, water pumping stations, baseyards, or farming. The area across from Kahi Mohala

AR00027566

appears to be used for storing and parking large buses and shuttles. Several large trees were observed in this area including earpod tree (*Enterolobium cyclocarpum*), kiawe, African tulip, monkey pod, and Chinese banyan (*Ficus microcarpa*).

The southern section of the parcel between Old Fort Weaver Road and the cliff contain flat areas where there is active farming and equipment buildings. The farm is growing basil, cucumber (*Cucumis sativus*), and horseradish tree (*Moringa oleifera*). Coconut trees (*Cocos nucifera*), papaya (*Carica papaya*), and bamboo (*Bambusa sp.*) are some of the plants observed growing around the farm buildings.

DISCUSSION AND RECOMMENDATIONS

None of the plants which occur on the project site is a threatened or endangered species or a species of concern (U.S. Fish and Wildlife Service, 1999a, 1999b, 2004; Wagner et. al., 1999). HBMP (Hawaii Biodiversity & Mapping Program) supplied historical and present locations of known Threatened and Endangered plant species within the project area for review. The only rare plant mapped near the project area was the kooloaula (*Abutilon menziesii*) population at the southern end of North-South Road. There were no threatened or endangered plants mapped within the Ho'opili project area itself. *A. menziesii* is protected by both the federal Endangered Species Act of 1973, as amended, and Chapter 195D, HRS, as amended. *A. menziesii* is a shrub of the mallow family, growing six to eight feet tall, with coarsely toothed, silvery, heart-shaped leaves that are about one to three inches long. Flowers are medium red to dark red and less than an inch in diameter. It has been sold as an ornamental plant at local nurseries in the past under the name "Red 'ilima." Other extant populations of Kooloaula currently exist on Lāna'i and Maui.

As part of the environmental planning for North-South Road and a portion of Kapolei Parkway, a "Habitat Conservation Plan for *Abutilon menziesii* at Kapolei" was finalized in March 2004. Mitigation measures have already been specified for these populations of *A. menziesii* related to construction of North-South Road. A concerted effort was made in surveying for *Abutilon menziesii* within the survey area. No plants of *A. menziesii* were observed during the survey.

No wetlands were encountered during either the January or May surveys. None of the three essential criteria for defining a federally recognized wetland were present within the study site. Those being hydrophytic vegetation, hydric soils, and wetland hydrology.

A follow up survey for wet season ephemeral plants was conducted in May following the heavy winter and spring rains. All parcels were resurveyed for additional plant species that may have been overlooked or died back during the January survey. No additional species were noted during this follow-up survey.

The proposed development of the surveyed area is not expected to have significant negative impacts on the botanical resources of the site or the general region.

PLANTS SPECIES LIST – Ho`opili, Oahu, Hawaii
MAIN PARCELS

The following checklist is an inventory of all the plant species observed within the three parcels of the survey site for the proposed Ho`opili project. The plant names are arranged alphabetically by family and then by species into two groups: Monocots and Dicots. The taxonomy and nomenclature of the flowering plants (Monocots and Dicots) are in accordance with Wagner *et al.* (1990), Wagner and Herbst (1999) and Staples and Herbst (2005). Recent name changes are those recorded in the Hawaii Biological Survey series (Evehuis and Eldredge, eds, 1999-2002).

For each species, the following name is provided:

1. Scientific name with author citation.
2. Common English and/or Hawaiian name(s), when known.
3. Biogeographic status. The following symbols are used:

I= indigenous= native to the Hawaiian Islands and elsewhere.

X=introduced or alien = all those plants brought to the Hawaiian Islands by humans, intentionally or accidentally, after Western contact, that is Cook's arrival in the islands in 1778.

Introduction

D. R. Horton – Schuler Division is proposing to develop a residential community on approximately 1,555-acres of land in the 'Ewa District, O'ahu (Figure 1). This report summarizes the findings of the avian and mammalian surveys that were conducted on the subject property to determine the potential effects of the proposed development on biological resources present on the site and within the general project area.

A primary goal of the surveys was to determine if there were any avian or mammalian species currently listed as endangered, threatened, or proposed for listing under either Federal or State of Hawaii endangered species statutes. Listed species status follows species identified in the following referenced documents (Division of Land and Natural Resources (DLNR) 1998, Federal Register 2005, U. S. Fish & Wildlife Service (USFWS) 2005, 2006). Fieldwork was conducted on July 20, and 21, 2006.

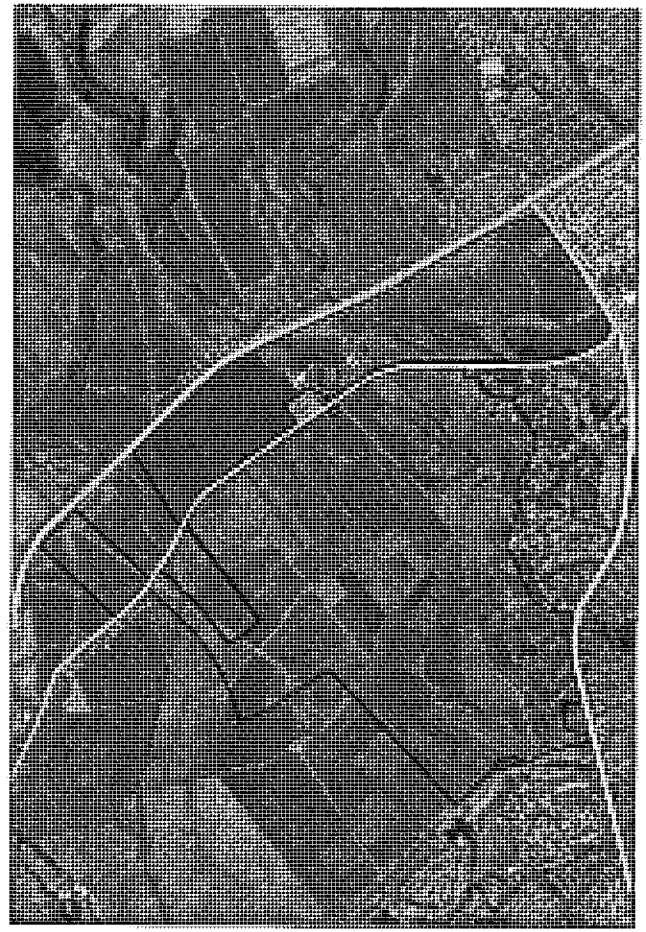
The avian phylogenetic order and nomenclature used in this report follows *The American Ornithologists' Union Checklist of North American Birds 7th Edition* (American Ornithologists' Union 1998), and the 42nd through the 47th supplements to *Check-list of North American Birds* (American Ornithologists' Union 2000; Banks et al. 2002, 2003, 2004, 2005, 2006). Mammal scientific names follow *Mammals in Hawaii* (Tomich 1986). Plant names follow *Manual of the Flowering Plants of Hawai'i* (Wagner et al. and Wagner and Herbst, 1990, 1999). Place names follow *Place Names of Hawaii* (Pukui et al. 1974).

Hawaiian and scientific names are italicized in the text. A glossary of technical terms and acronyms used in the document, which may be unfamiliar to the reader, are included at the end of the narrative text on Page 11.

General Site Description

The proposed Ho'opili Development includes five main parcels which are identified as (TMK: 9-1-17:04 (por.), 9-1-17:59 and 9-1-17:72, 9-1-18:01 and 9-1-18:04, and two smaller "off-site" parcels, which are covered in two separate reports (David 2008a, 2008b). This reports covers the approximately 1555-acres, which make up the main development area (Figure 1).

The project site is made up primarily of former sugar cane fields, most fallow now, though some are being farmed for various diversified agricultural crops. The site is bound to the north by the H-1 Freeway, to the east by Fort Weaver Road and to the west by additional former sugar cane lands. Farrington Highway transects the side from east to west (Figure 1). The terrain slopes gently from the north-to-south, from an elevation of approximately 200-feet above mean sea level (MSL) at the north corner of the site, adjacent to Fort Weaver Road and H-1 Freeway off ramp, down to approximately 60-feet MSL at the southwestern corner of the site located along Mango Tree Road (Figure 1).



AR00027574

Much of the site is made up of former sugar cane land, some of which is bare, (Figure 2), and some of which is under active cultivation of various diversified crops, such as corn, and bananas (Figure 3). Areas along roads and between fields are vegetated with a mix of predominantly alien ruderal species typical of disturbed former sugar fields on O'ahu (Figure 2). The vegetation present on the project site is almost completely dominated by alien species. The botanical surveys conducted on the site identified 137-plant species, four of which are considered indigenous, the remainder alien to the Hawaiian Islands (LeGrande 2006).

Mammalian Survey Methods

All observations of mammalian species were of an incidental nature. With the exception of the endangered Hawaiian hoary bat (*Lasiurus cinereus semotus*), or *'ōpe'ape'a* as it is known locally, all terrestrial mammals currently found on the Island of O'ahu are alien species, and most are ubiquitous. Two hours were spent within the project area on the evenings of August 30 and 31, 2006 and again in the early morning hours of August 31, and September 1, 2006, in an attempt to detect Hawaiian hoary bats. The survey of mammals was limited to visual and auditory detection, coupled with visual observation of scat, tracks, and other animal signs. A running tally was kept of all vertebrate species observed and heard within the study area.

Mammalian Survey Results

Five mammalian species were detected within the project site. Numerous European house mice (*Mus musculus domesticus*) were seen at several locations during the course of this survey. A total of five domestic dogs (*Canis f. familiaris*) were seen within, or adjacent to the study area. Nine small Indian mongooses (*Herpestes a. auropunctatus*) were seen at various locations within the site, as were three cats (*Felis catus*). Many more dogs and cats were seen and or heard within existing developments located to the northeast and southeast of the proposed project site. Additionally, tracks, scat and sign of dog, mongoose, cat, and horse (*Equus c. caballus*) were observed in numerous locations within the project site.

The endangered Hawaiian hoary bat was not recorded during the course of this survey. This finding is not surprising given that this species has rarely been documented from the Island of O'ahu (Tomich 1986, USFWS 1998).

Avian Survey Methods

Twenty-seven avian count stations were sited along linear transects within the subject property. Six-minute point counts were made at each of the 27-count stations. Field observations were made using Leitz 10 X 42 binoculars and by listening for avian vocalizations. Counts took place between 06:30 a.m. and 11:00 a.m., the peak of daily bird activity. An additional two hours was spent within the project area on the evenings of August 30 and 31, 2006 and again in the early morning hours of August 31, and September 1, 2006 in an attempt to detect crepuscular and/or nocturnally flying seabirds and owls. Time not spent conducting station counts was used to search the subject property for species and habitats not detected during count sessions.

Figure 3 – Cornfields typical of diversified crops to the south of Farrington Hwy.

AR00027575

Avian Survey Results

A total of 831 individual birds, of 24 different avian species, representing 15 separate families were recorded during station counts. These results are summarized in Table 1. Two of the species recorded, Pacific Golden-Plover (*Pluvialis fulva*) and Ruddy Turnstone (*Arenaria interpres*), are indigenous migratory shorebird species. Both species breed in the high Arctic, and spend their winters in Hawai'i and the tropical Pacific. The remaining 22 species detected are considered to be alien to the Hawaiian Islands (Table 1).

Avian diversity and densities were relatively low, not surprising given the depauperate state of the habitat found on most of the site. Four species, Common Waxbill (*Estrilda astrild*), Red-vented Bulbul (*Pycnonotus cafer*), Common Myna (*Acridotheres tristis*), and Spotted Dove (*Streptopelia chinensis*) accounted for slightly less than 43% of the total number of individual birds recorded. Common Waxbills were the most frequently recorded species, accounting for more than 13% of the total number of individual birds recorded during station counts. We recorded an average of 23 birds per station count.

AR00027576

Discussion

Mammalian Resources

The findings of the mammalian survey are consistent with the findings of at least one other recent survey conducted on lands immediately adjacent to the subject property (David 2005a), as well as with several others faunal surveys conducted in the general vicinity of the subject property in the recent past (David 2000, 2001, 2005b, 2008a, 2008b, David and Guinther 2000, 2005, 2006, 2007).

As previously mentioned we did encounter several European house mice within the project site. It is also likely that the other three established *muridae* in Hawaii, roof rats (*Rattus r.rattus*), Norway rats (*Rattus norvegicus*), and possibly Polynesian rats (*Rattus exulans hawaiiensis*), use resources present within the project site. These commensal species are all but ubiquitous on the island of O'ahu. All of these introduced rodents are deleterious to remaining native ecosystems and the native floral and faunal species that are dependant on them for their survival.

Avian Resources

The findings of the avian survey are consistent with the findings of at least one other recent avian survey conducted on lands immediately adjacent to the subject property (David 2005a), as well as with several others avian surveys conducted in the general vicinity of the subject property in the recent past (David 2000, 2001, 2005b, 2008a, 2008b, David and Guinther 2000, 2005, 2006, 2007).

Only two of the 24-avian species recorded during the course of this survey are native species. The two species in question, Pacific Golden-Plover, and Ruddy Turnstone are indigenous migratory shorebird species that breed in the high Arctic and spend the winter months in Hawai'i and the tropical Pacific. Both species are readily seen throughout the Hawaiian Islands between late July and the end of April each year. The remaining 22-species detected are considered to be alien to the Hawaiian Islands (Table 1).

Although not detected during this survey, it is likely that the Hawaiian endemic sub-species of the Short-eared Owl *Asio flammeus sandwichensis*), or *pueo* use resources within the general project area. This species is regularly seen along the Wai'anae coast from the Lualualei Naval Reservation to Waimānalo Gulch (David 2005c). The O'ahu population of the short-eared Owl is listed as an endangered species under the State of Hawai'i's endangered species program, though; it is not protected under the federal endangered species statutes (DLNR 1998).

From an avian and native mammalian perspective there is nothing unique about the subject property, and none of the study area is important habitat for any listed avian or mammalian species currently known from the Island of O'ahu.

Conclusions

It is not expected that the modification of the project area or the development of the site will have a negative impact on any avian or mammalian species currently listed as endangered, threatened, or any that are currently proposed for listing under either Federal or State of Hawai'i endangered species statutes.

AR00027577

Glossary

Alien - Introduced to Hawai'i by humans
Commensal - Animals that share human food such as rats and mice
Crepuscular – Twilight hours
Depauperate – Lacking in numbers or variety of species
Endangered – Listed and protected under the ESA as an endangered species
Endemic – Native and unique to the Hawaiian Islands
Indigenous - Native to the Hawaiian Islands, but also found elsewhere naturally
Muridae - Rodents, including rats, mice and voles, one of the most diverse families of mammals.
Nocturnal – Night-time, after dark
'ope'ape'a – Hawaiian hoary bat (*Lasiurus cinereus semotus*)
pueo – Hawaiian endemic sub-species of the Short-eared Owl (*Asio flammeus sandwichensis*)
Ruderal – Disturbed, rocky, rubbishy areas, such as old agricultural fields and rock piles
Threatened - Listed and protected under the ESA as a threatened species

Introduction

D. R. Horton – Schuler Division is proposing to use a triangular parcel of land located to the east of Fort Weaver Road as a storm water retention basin for their proposed Ho'opili Development in East Kapolei, 'Ewa District, O'ahu (Figure 1). A portion of the site is currently being used as such by developments to the north and west of the site. This report summarizes the findings of the avian and mammalian surveys that were conducted within this site to determine the potential effects of the proposed development on biological resources present on the site and within the general project area (Figure 1).

A primary goal of the surveys was to determine if there were any avian or mammalian species currently listed as endangered, threatened, or proposed for listing under either Federal or State of Hawaii endangered species statutes present on, or close to the proposed project areas. Listed species status follows species identified in the following referenced documents (Division of Land and Natural Resources (DLNR) 1998, Federal Register 2005, U. S. Fish & Wildlife Service (USFWS) 2005, 2006). Fieldwork was conducted on August 15, 2006.

The avian phylogenetic order and nomenclature used in this report follows *The American Ornithologists' Union Checklist of North American Birds 7th Edition* (American Ornithologists' Union 1998), and the 42nd through the 47th supplements to *Check-list of North American Birds* (American Ornithologists' Union 2000; Banks et al. 2002, 2003, 2004, 2005, 2006). Mammal scientific names follow *Mammals in Hawaii* (Tomich 1986). Plant names follow *Manual of the Flowering Plants of Hawai'i* (Wagner et al. and Wagner and Herbst, 1990, 1999). Place names follow *Place Names of Hawaii* (Pukui et al. 1974).

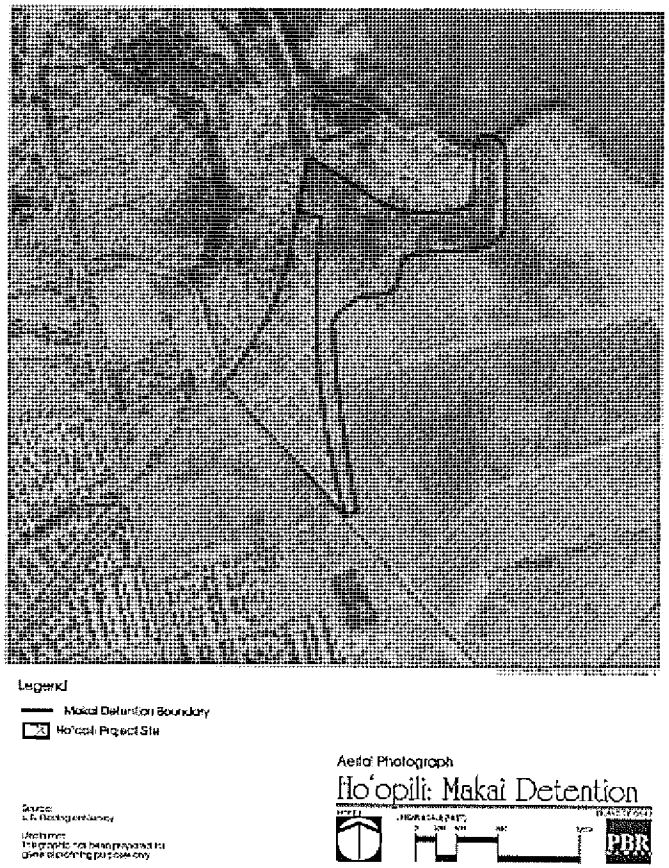
Hawaiian and scientific names are italicized in the text. A glossary of technical terms and acronyms used in the document, which may be unfamiliar to the reader, are included at the end of the narrative text on Page 9.

General Site Description

The proposed Ho'opili Development includes five main parcels, which are covered in a separate report, and two smaller "off-site" parcels, which are covered in two separate reports (David 2008a, 2008b). This report covers a proposed storm water detention basin which is to be located to the east of Fort Weaver Road, and south of the Honouliuli Unit of the Pearl Harbor National Wildlife Refuge (Figure 1). The site is transected by the former OR&L railway line. A corridor running from the original detention site to Pearl Harbor was not surveyed, as we were unable to secure access to the area, which is controlled by the U. S. Navy.

The project site is made up of an approximately 2-acre detention basin on the northern third of the site. The southern third of the site is in active cultivation of corn (*Zea mays*) and tomatoes (*Solanum lycopersicum*). The vegetation present on the project site is almost completely dominated by alien species. The botanical surveys conducted on the site identified 73-plant species, three of which are considered indigenous, the remainder being alien to the Hawaiian Islands (LeGrande 2006).

Figure 1 – Ho'opili Makai Detention Site



AR00027581

Mammalian Survey Methods

All observations of mammalian species were of an incidental nature. With the exception of the endangered Hawaiian hoary bat (*Lasiurus cinereus semotus*), or *'ōpe'ape'a* as it is known locally, all terrestrial mammals currently found on the Island of O'ahu are alien species, and most are ubiquitous. The survey of mammals was limited to visual and auditory detection, coupled with visual observation of scat, tracks, and other animal sign. A running tally was kept of all vertebrate species observed and heard within the study area.

Mammalian Survey Results

Three mammalian species were detected within the project site. Three small Indian mongooses (*Herpestes a. auropunctatus*) were seen at various locations within the site. Several dogs (*Canis f. familiaris*) were heard barking from within existing developments located to the northwest of the site. Tracks, scat and sign of mongoose cat (*Felis catus*) and dog were encountered in several locations within the site. The endangered Hawaiian hoary bat was not recorded during the course of this survey. This finding is not surprising given that this species has rarely been documented from the Island of O'ahu (Tomich 1986, USFWS 1998).

Avian Survey Methods

Five avian count stations were sited along two linear transects running the length of the site. Stations were sighted approximately 300-meters apart. Six-minute point counts were made at each of the nine-count stations. Field observations were made using Leitz 10 X 42 binoculars and by listening for avian vocalizations. Counts took place between 06:30 a.m. and 11:00 a.m., the peak of daily bird activity. Time not spent conducting station counts was used to search the subject property for species and habitats not detected during count sessions.

Avian Survey Results

A total of 170 individual birds, of 20-different avian species, representing 13-separate families were recorded during station counts. These results are summarized in Table 1. One of the species recorded, Black-crowned Night-Heron (*Nycticorax nycticorax hoactli*), is a resident indigenous breeding species. Two others, Pacific Golden-Plover (*Pluvialis fulva*) and Ruddy Turnstone (*Arenaria interpres*), are indigenous migratory shorebird species. Both of which breed in the high Arctic, and spend their winters in Hawai'i and the tropical Pacific. The remaining 17-species detected are considered to be alien to the Hawaiian Islands (Table 1).

The survey results were in keeping with the habitat present on the site, and it's location on the Island of O'ahu. Three species, Common Waxbill (*Estrilda astrild*), Zebra Dove (*Geopelia striata*), and Spotted Dove (*Streptopelia chinensis*), accounted for more than 45% of the total number of individual birds recorded. Common Waxbills were the most frequently recorded species, accounting for more slightly less that 19% of the total number of individual birds recorded during station counts. We recorded an average of 20 birds per station count.

KEY TO TABLE 1

ST Status

D Domesticated Species – Not currently considered to be established on the Island of O'ahu

A Alien – introduced to the Hawaiian Islands by humans

IM Indigenous Migrant – a native migratory species that winters in Hawai'i but breeds elsewhere

RA Relative Abundance – number of birds detected divided by the number of count stations (5)

Discussion

Mammalian Resources

The findings of the mammalian survey are consistent with the findings of several others faunal surveys conducted in the general vicinity of the subject property in the recent past (David 2000, 2001, 2005a, 2005b, 2007, 2008a, 2008b, David and Guinther 2000, 2005, 2006, 2007).

Although none of the four established *muridae* were detected during the course of this survey, it is likely that, European house mice (*Mus musculus domesticus*), Hawai'i, roof rats (*Rattus r. rattus*), Norway rats (*Rattus norvegicus*), and possibly Polynesian rats (*Rattus exulans hawaiiensis*), use resources present within the project site. These commensal species are all but ubiquitous on the island of O'ahu. All of these introduced rodents are deleterious to remaining native ecosystems and the native floral and faunal species that are dependant on them for their survival.

Avian Resources

The findings of the avian survey are consistent with the findings of several others avian surveys conducted in the general vicinity of the subject property in the recent past (David 2000, 2001, 2005a, 2005b, 2007, 2008a, 2008b, David and Guinther 2000, 2005, 2006, 2007).

Three of the 20-avian species recorded during the course of this survey are native species. Black-crowned Night-Herons are an indigenous resident breeding species. They are regularly seen in

and around just about any kind of standing or running water present on O'ahu. The other two native species recorded, Pacific Golden-Plover and Ruddy Turnstone, are indigenous migratory shorebird species that breed in the high Arctic and spend the winter months in Hawai'i and the tropical Pacific. Both species are readily seen throughout the Hawaiian Islands between late July and the end of April each year. The remaining 17-species detected are considered to be alien to the Hawaiian Islands (Table 1).

Four waterbird species that are currently listed as endangered under both the Federal and State of Hawai'i's endangered species statutes, Hawaiian Duck x Mallard hybrids (*Anas wyvilliana x platyrhynchos*), Common Moorhen (*Gallinula chloropus sandvicensis*), Hawaiian Coot (*Fulica alai*), and Black-necked Stilt (*Himantopus mexicanus knudsen*), are present within the general project area, although there currently is no suitable habitat within the project site for them. All four species breed within the Honouliuli unit of the Pearl Harbor National Wildlife Refuge, which is located some 250-meters north of the proposed site. They are also regularly encountered on the golf course located to the northwest of the project site. At such time as the detention basin is enlarged, and when water ponds within it, it is likely that one or more of these species may start to use resources present within the expanded detention basin. According to the projects' civil engineer, Bills Engineering Inc. this is likely to happen very infrequently.

Although not detected during this survey, it is likely that the Hawaiian endemic sub-species of the Short-eared Owl (*Asio flammeus sandwichensis*), or *pueo* use resources within the general project area occasionally. This species is regularly seen along the Wai'anae coast from the Lualualei Naval Reservation to Waimānalo Gulch (David 2005c). I have also seen them within the Honouliuli unit of the Pearl Harbor National Wildlife Refuge upon occasion (David 2007e). The O'ahu population of the short-eared Owl is listed as an endangered species under the State of Hawai'i's endangered species program, though; it is not protected under the federal endangered species statutes (DLNR 1998).

From an avian and native mammalian perspective there is nothing unique about the habitat present within the *makai* detention site. None of the habitat present on the project site is important habitat for any listed avian or mammalian species currently known from the Island of O'ahu.

Conclusions

It is not expected that the modification of the habitat currently found within the proposed makai detention site will result in any deleterious impacts to any avian or mammalian species currently listed as endangered, threatened, or any that are currently proposed for listing under either Federal or State of Hawai'i endangered species statutes.

AR00027583

Glossary

Alien - Introduced to Hawai'i by humans
Commensal - Animals that share human food such as rats and mice
Crepuscular – Twilight hours
Endangered – Listed and protected under the ESA as an endangered species
Endemic – Native and unique to the Hawaiian Islands
Indigenous - Native to the Hawaiian Islands, but also found elsewhere naturally
makai – Down-slope, towards the ocean
mauka – Upslope, towards the mountains
Muridae - Rodents, including rats, mice and voles, one of the most divers families of mammals.
Nocturnal – Night-time, after dark
'ōpe'ape'a – Hawaiian hoary bat (*Lasiurus cinereus semotus*)
pueo – Hawaiian endemic sub-species of the Short-eared Owl (*Asio flammeus sandwichensis*)
Ruderal – Disturbed, rocky, rubbishy areas, such as old agricultural fields and rock piles
Threatened - Listed and protected under the ESA as a threatened species

Introduction

D. R. Horton – Schuler Division is proposing to develop two new potable water tanks (440 and 228) as well as approximately 5600-feet of waterline to service their proposed Ho'opili Development which is to be located *makai* of the water infrastructure in the 'Ewa District, O'ahu (Figure 1). This report summarizes the findings of the avian and mammalian surveys that were conducted along the proposed waterline routes and on the proposed water tank sites, to determine the potential effects of the proposed development on biological resources present on the site and within the general project area (Figure 1).

A primary goal of the surveys was to determine if there were any avian or mammalian species currently listed as endangered, threatened, or proposed for listing under either Federal or State of Hawaii endangered species statutes present on, or close to the proposed project areas. Listed species status follows species identified in the following referenced documents (Division of Land and Natural Resources (DLNR) 1998, Federal Register 2005, U. S. Fish & Wildlife Service (USFWS) 2005, 2006). Fieldwork was conducted on July 20, and 21, 2006.

The avian phylogenetic order and nomenclature used in this report follows *The American Ornithologists' Union Checklist of North American Birds 7th Edition* (American Ornithologists' Union 1998), and the 42nd through the 47th supplements to *Check-list of North American Birds* (American Ornithologists' Union 2000; Banks et al. 2002, 2003, 2004, 2005, 2006). Mammal scientific names follow *Mammals in Hawaii* (Tomich 1986). Plant names follow *Manual of the Flowering Plants of Hawai'i* (Wagner et al. and Wagner and Herbst, 1990, 1999). Place names follow *Place Names of Hawaii* (Pukui et al. 1974).

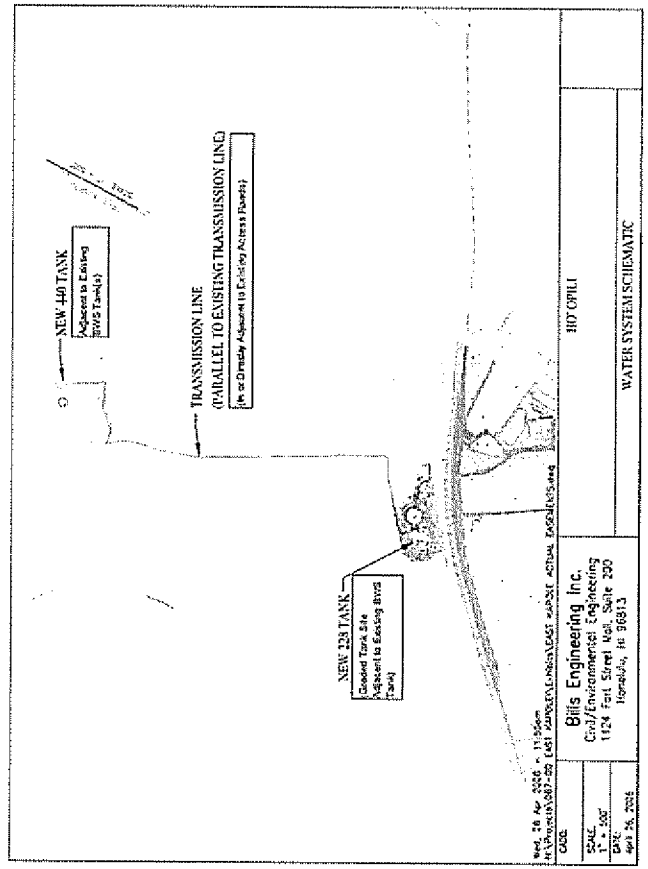
Hawaiian and scientific names are italicized in the text. A glossary of technical terms and acronyms used in the document, which may be unfamiliar to the reader, are included at the end of the narrative text on Page 10.

General Site Description

The proposed Ho'opili Development includes five main parcels, which are covered in a separate report, and two smaller "off-site" parcels, which are covered in two separate reports (David 2008a, 20008b). This reports covers two proposed above ground reservoir sites and associated water transmission line routes, all of which are located *mauka*, or north of the H-1 Freeway (Figure 1 and 2).

The project site is made up primarily of a dirt road, which extends some 4000-feet *mauka* from the H-1 Freeway. The proposed 228 water tank site is located on a previously graded pad, immediately adjacent to an existing Board of Water Supply (BWS) water tank just *mauka* of the H-1 Freeway. The proposed 440 water tank is located adjacent to yet another BWS water tank in a former pineapple field, which was fallow at the time of this survey. The proposed water transmission line will be located parallel to the existing BWS transmission line which currently runs along the dirt road between the two existing tanks (Figure 1).

Figure 1 – New 440 Tank, Transmission Line and New 228 Tank Schematic



AR00027587

Figure 2
Aerial Photograph Showing Transmission Line and Tank Sites

The termin on the project site slopes from north-to-south, from an elevation of approximately 440-feet above mean sea level (MSL) at the northern terminus of the site, down to approximately 200-feet MSL along the H-1 Freeway (Figure 1).

As can clearly be seen in Figure 2 the habitat present within the general project site is made up of former sugar cane lands, some of which have in recent years been used to grow various diversified agricultural crops. The new 440 tank site is located on a relatively flat parcel of land formerly used to grow pineapple. The entire project site has been heavily disturbed by agricultural activities and the existing water supply infrastructure. The vegetation present on the project site is almost completely dominated by alien species. The botanical surveys conducted on the site identified 56-plant species, two of which are considered indigenous, the remainder alien to the Hawaiian Islands (LeGrande 2006).

Mammalian Survey Methods

All observations of mammalian species were of an incidental nature. With the exception of the endangered Hawaiian hoary bat (*Lasiurus cinereus semotus*), or *'ōpe'ape'a* as it is known locally, all terrestrial mammals currently found on the Island of O'ahu are alien species, and most are ubiquitous. Two hours were spent within the project area on the evening of July 20, 2006 and again in the early morning hours of July 21, 2006, in an attempt to detect Hawaiian hoary bats. The survey of mammals was limited to visual and auditory detection, coupled with visual observation of scat, tracks, and other animal sign. A running tally was kept of all vertebrate species observed and heard within the study area.

Mammalian Survey Results

Three mammalian species were detected within the project site. Several small Indian mongooses (*Herpestes a. auropunctatus*) were seen at various locations along the dirt road and close to the Hawaiian Electric Companies switching station located at the *mauka* end of the site. We also encountered tracks, scat and sign of dog (*Canis f. familiaris*), cat (*Felis catus*), and mongoose at several locations along the dirt road.

The endangered Hawaiian hoary bat was not recorded during the course of this survey. This finding is not surprising given that this species has rarely been documented from the Island of O'ahu (Tomich 1986, USFWS 1998).

Avian Survey Methods

Seven avian count stations were sited along a linear transect running the length of the dirt road and extending east from the *mauka* water tank site. Stations were sighted approximately 900-feet apart. Six-minute point counts were made at each of the seven-count stations. Field observations were made using Leitz 10 X 42 binoculars and by listening for avian vocalizations. Counts took place between 06:30 a.m. and 11:00 a.m., the peak of daily bird activity. An additional two hours was spent within the project area on the evening of July 20, 2006 and again in the early morning hours of July 21, 2006, in an attempt to detect crepuscular and/or nocturnally flying seabirds and

AR00027588

owls. Time not spent conducting station counts was used to search the subject property for species and habitats not detected during count sessions.

Avian Survey Results

A total of 152 individual birds, of 13 different avian species, representing 11-separate families were recorded during station counts. These results are summarized in Table 1. One of the species recorded, Pacific Golden-Plover (*Pluvialis fulva*), is an indigenous migratory shorebird species. Pacific Golden-Plover breed in the high Arctic, and spend their winters in Hawai'i and the tropical Pacific. The remaining 12 species detected during the course of this survey are considered to be alien to the Hawaiian Islands (Table 1).

Avian diversity and densities were relatively low, not surprising given the depauperate state of the habitat found on most of the site. Three species, Common Waxbill (*Estrilda astrild*), Zebra Dove (*Geopelia striata*), and Japanese White-eye (*Zasteropus japonicus*) accounted for slightly less than 41% of the total number of individual birds recorded. Common Waxbills were the most frequently recorded species, accounting for more than 15% of the total number of individual birds recorded during station counts. We recorded an average of 22 birds per station count.

Discussion

Mammalian Resources

The findings of the mammalian survey are consistent with the findings of at least two other recent surveys conducted on lands immediately adjacent to the subject property (David 2005a, 2007a), as well as with several others faunal surveys conducted in the general vicinity of the subject property in the recent past (David 2000, 2001, 2005b, 2008a, 2008b, David and Guinther 2000, 2005, 2006, 2007).

Although we did not record any of the four muridae species currently considered to be established on O'ahu, it is likely that, European house mouse (*Mus musculus domesticus*) Hawai'i, roof rat (*Rattus r. rattus*), Norway rat (*Rattus norvegicus*), and possibly Polynesian rats (*Rottus exulans hawaiiensis*) use resources present within the project site. These commensal species are all but ubiquitous on the island of O'ahu. All of these introduced rodents are deleterious to remaining native ecosystems and the native floral and faunal species that are dependant on them for their survival.

Avian Resources

The findings of the avian survey are consistent with the findings of at least two other recent avian surveys conducted on lands immediately adjacent to the subject property (David 2005a, 2007a), as well as with several others avian surveys conducted in the general vicinity of the subject property in the recent past (David 2000, 2001, 2005b, 2008a, 2008b, David and Guinther 2000, 2005, 2006, 2007).

AR00027589

KEY TO TABLE 1

ST Status
A Alien – introduced to the Hawaiian Islands by humans
IM Indigenous Migrant – a native migratory species that winters in Hawai'i but breeds elsewhere
RA Relative Abundance – number of birds detected divided by the number of count stations (7)

Only one of the 13-avian species recorded during the course of this survey, Pacific Golden-Plover, is a native species. Pacific Golden-Plover are an indigenous migratory shorebird species that breed in the high Arctic and spends the winter months in Hawai'i and the tropical Pacific. This species is readily seen throughout the Hawaiian Islands between late July and the end of April each year. The remaining 12-species detected during the course of this survey are considered to be alien to the Hawaiian Islands (Table 1).

Although not detected during this survey, it is likely that the Hawaiian endemic sub-species of the Short-eared Owl (*Asio flammeus sandwichensis*), or *pueo* use resources within the general project area occasionally. This species is regularly seen along the Wai'anae coast from the Lualualei Naval Reservation to Waimānalo Gulch (David 2005c). The O'ahu population of the short-eared Owl is listed as an endangered species under the State of Hawai'i's endangered species program, although it is not protected under the federal endangered species statutes (DLNR 1998).

From an avian and native mammalian perspective there is nothing unique about the project area or within the reservoir site, and none of the habitat present within the study area is important habitat for any listed avian or mammalian species currently known from the Island of O'ahu.

Conclusions

It is not expected that the modification of the project area will have a deleterious impact on any avian or mammalian species currently listed as endangered, threatened, or any that are currently proposed for listing under either Federal or State of Hawai'i endangered species statutes.

Glossary

Alien - Introduced to Hawai'i by humans
BWS – Board of Water Supply
Commensal - Animals that share human's food such as rats and mice
Crepuscular – Twilight hours
Endangered – Listed and protected under the ESA as an endangered species
Endemic – Native and unique to the Hawaiian Islands
Indigenous - Native to the Hawaiian Islands, but also found elsewhere naturally
makai – Down-slope, towards the ocean
mauka – Upslope, towards the mountains
Muridae - Rodents, including rats, mice and voles, one of the most diverse families of mammals.
Nocturnal – Night-time, after dark
'ōpe'ape'a – Hawaiian hoary bat (*Lasiurus cinereus semotus*)
pueo – Hawaiian endemic sub-species of the Short-eared Owl (*Asio flammeus sandwichensis*)
Ruderal – Disturbed, rocky, rubbishy areas, such as old agricultural fields and rock piles
Threatened - Listed and protected under the ESA as a threatened species

BWS – Honolulu Board of Water Supply
ESA – Endangered Species Act of 1973, as amended
DLNR – Hawaii State Department of Land & Natural resources
TMK – Tax Map Key
USFWS – U.S. Fish & Wildlife Service

Management Summary

Reference	An Archaeological Inventory Survey For the East Kapolei Project, Honouliuli Ahupua'a, 'Ewa District, Island of O'ahu, TMK: (1) 9-1-010:001, 9-1-017:004, 059, 072; 9-1-018:001, 004, 9-2-001:001, by Constance R. O'Hare, David W. Shideler, and Dr. Hallett H. Hammatt
Date	February 2006
Project Number (s)	CSH Job Code: HONO 75
Investigation Permit Number	CSH completed the inventory survey fieldwork under state archaeological permit No. 0508 issued by the State Historic Preservation Division, per Hawai'i Administrative Rules (HAR) Chapter 13-13-282.
Project Location	The main project area comprises TMK:(1) 9-1-017:004, 059, 072; 9-1-018:001, 004. The main project area is generally bound on the north by the H-1 Interstate (I H-1), on the south by Mango Tree Road (a dirt road along the Ewa Villages Golf Course), Pelehua Drive on the west, and Old Fort Weaver Road on the east. There are two non-contiguous parcels, one on the east side of new Fort Weaver Road (TMK 9-1-010:002, and one north of the H-1 Interstate around a reservoir (TMK 9-2-001:001).
Land Jurisdiction	The James Campbell Estate, owner
Agencies	State Historic Preservation Division / Department of Land and Natural Resources (SHPD/DLNR)
Project Description	The landowner plans to develop the area into a mixed residential, commercial, and recreational property.
Project Acreage	2625 acres
Area of Potential Effect (APE)	For the purposes of this study the area of potential effect (APE) and the project area are considered one and the same.
Historic Preservation Regulatory Context	The client, D.R. Horton-Schuler Division proposed development of James Campbell Estate East Kapolei lands constitutes a project requiring compliance with and review under State of Hawai'i historic preservation review legislation (Hawai'i Revised Statutes (HRS) Chapter 6E-42 and Hawai'i Administrative Rules (HAR) 13-284). At the request of D.R. Horton-Schuler Division, CSH completed an archaeological inventory survey investigation, per the requirements of HAR Chapter 13-13-276, of the subject 2625-acre parcel. This archaeological inventory survey report was prepared to support the proposed property's historic preservation review and any other project-related historic preservation consultation
Fieldwork Effort	Constance R. O'Hare, B.A., Owen O'Leary, M.A., Guadalupe Ochoa, B.A., Brad Garrett, M.A., and Jen Tulchin, B.A., under the general direction of Hallett H. Hammatt, Ph.D. conducted surface survey and subsurface testing in the project area. Field work was conducted on November 21, 22, 28, on December 8 and 9, 2005, and January 13, 2006..
Number of Historic Properties Identified	Five sites had been previously identified in a 1990 CSH survey (Hammatt and Shideler 1990). One of these sites (50-80-12-4344) was used to denote Ewa Sugar Plantation scattered infrastructure features. Three features (Features A-C) were recorded for this site during the 1990 survey. During the recent 2005 surface survey, four additional sugar plantation features were recorded. These will be considered additional features (Features D-F) of Site -4344.

AR00027594

Historic Properties Recommended Eligible to the Hawai'i Register of Historic Places (Hawai'i Register)	Sites 50-80-12-4344 (plantation infrastructure), -4345 (railroad berm), -4346 (northern pumping station), -4347 (central pumping station), and -4348 (southern pumping station) have been previously determined during a 1990 survey to be significant under Criteria C and D. Sites -4345 through- 4348 were also recommended for preservation. No further work or preservation was recommended for -4344. All five sites were revisited during the recent 2005 survey; four additional features were added to Site –4344, however, the original three features (Features A-C) have been destroyed since 1990. The significance and recommendations of these five sites remains the same.
Historic Properties Recommended Ineligible to the Hawai'i Register	Four areas of historic habitation (Honouliuli Taro Lands, Kapalani Catholic Church, PipeLine Village, and Drivers/Stable Village) were identified during the 1990 survey of a portion of the project area. No site designations were given, since there were no surface remains found during the survey. During the recent 2005 backhoe testing for the current project, no subsurface remains for these four habitation loci were found in the project area. No site designations are needed.
Mitigation Recommendation	Although no subsurface remains for four habitation loci were found during the recent backhoe testing of the four areas, it is recommended that a program of on-site/on-call monitoring be conducted during any future development of these four specific areas.

Section 1 Introduction

1.1 Project Background

At the request of D.R. Horton-Schuler Division (828 Fort Street Mall, 4th Floor, Honolulu, HI 96813), Cultural Surveys Hawai'i, Inc. (CSH) has completed this Inventory Survey Report for the East Kapolei Project, Honouliuli Ahupua'a, 'Ewa District, O'ahu Island ([1] 9-1-010:002; 9-1-017:004, 059, 072; 9-1-018:001, 004; 9-2-001:001) (Figures 1 and 2). The main project area is generally bound on the north by the H-1 Interstate (I H-1), on the south by Mango Tree Road (a dirt road along the Ewa Villages Golf Course), Pelehua Drive on the west, and Old Fort Weaver Road on the east. There are two non-contiguous sections, a parcel on the east side of West Loch Estates and a parcel north of the H-1 Interstate, surrounding a reservoir. In all, the project area is approximately 2625 acres. The landowner, the James Campbell estate, plan to develop this area into a mixed residential, commercial, and recreational property (Figure 3).

CSH previously worked on the eastern 546-acres of these lands back in 1990 in association with what was then known as the West Loch Bluffs project (Hammatt and Shideler 1990). In the course of this study, we were able to determine that the eastern lands of the present project area contain more historic resources than one might guess, including such features as:

- A northern pumping station;
- a central pumping station complex;
- a southern pumping station;
- the former site of PipeLine Village;
- the former site of Drivers and Stable Villages;
- the former site of Hawaiian Land Commission Awards and former Hawaiian Homesteads;
- the former site of the Honouliuli "Kapalani" Roman Catholic Church;
- a well preserved portion of the Ewa Plantation Company railroad berm; and,
- the site of the first artesian well in Hawai'i.

Based on the presence of these sites and presumably others, CSH recommended an inventory survey that includes both surface and subsurface investigation. Based on the known data, subsurface testing with a backhoe is needed during the inventory survey. Backhoe testing will focus on locating and evaluating subsurface deposits, such as buried cultural layers, artifacts, and possibly burials that could not be located by surface pedestrian inspection. Backhoe testing will be conducted in four areas, at the site of the nineteenth century Kapalani Church, the area of Hawaiian Land Commission Awards, the location of Drivers/Stable Village, and the location of PipeLine Village, with its associated church.

The archaeological inventory survey and its accompanying report will document all historic properties within the subject parcel. The prepared inventory survey will be in compliance with state standards and will be submitted for review and approval to the State Historic Preservation Division/Department of Land and Natural Resources (SHPD/DLNR).

AR00027599

1.2 Scope of Work

The following archaeological inventory survey scope of work will satisfy the State and County requirements:

1. State rules have recently been established which require consultation with community members as part of the inventory survey process. This consultation requires contacting knowledgeable members of the community and requesting information on historic and cultural issues related to the property.
2. A complete ground survey of the entire project area for the purpose of site inventory. All sites would be located, described, and mapped with evaluation of function, interrelationships, and significance. Documentation will include photographs and scale drawings of selected sites and complexes. All sites will be assigned State site numbers.
3. Subsurface testing to determine if subsurface deposits are located in the project area, and, if so, evaluate their significance. If appropriate samples from these excavations are found, they will be analyzed for chronological and paleoenvironmental information.
4. Research on historic and archaeological background, including search of historic maps, written records, and Land Commission Award documents. This research will focus on the specific area with general background on the *ahupua'a* and district and will emphasize settlement patterns.
5. Preparation of a survey report which will include the following:
    a. A topographic map of the survey area showing all archaeological sites and site areas;
    b. Results of consultation with knowledgeable community members about the property and its historical and cultural issues.
    c. Description of all archaeological sites with selected photographs, scale drawings, and discussions of function;
    d. Historical and archaeological background sections summarizing prehistoric and historic land use as they relate to the archaeological features;
    e. A summary of site categories and their significance in an archaeological and historic context;
    f. Recommendations based on all information generated that will specify what steps should be taken to mitigate impact of development on archaeological resources - such as data recovery (excavation) and preservation of specific areas. These recommendations will be developed in consultation with the client and the State agencies.

This scope of work also includes full coordination with the State Historic Preservation Division (SHPD), and County relating to archaeological matters. This coordination takes place after consent of the owner or representatives.

Part of the SHPD mandated scope of work for an archaeological inventory survey includes specific documentation of located historic properties. If cultural deposits are located, it is required that appropriate data are collected from them. This includes recording their geographic location on project area maps, general written descriptions, sampling, and section drawings, plan views, and photographs as appropriate. For traditional Hawaiian deposits, this can include analysis of recovered artifacts and midden. It often also includes radiocarbon dating of samples from cultural contexts. If historic-era deposits are located then analysis of associated historic artifacts is sometimes required.

1.3 Environmental Setting

1.3.1 Natural Environment

Honouliuli Ahupua'a is the largest traditional land unit on O'ahu, extending from the West Loch of Pearl Harbor in the east, to the border of Nānākuli Ahupua'a at Pili o Kahe in the west. Honouliuli Ahupua'a includes approximately 19 km (kilometers), or 12 mi (miles) of open coastline from One'ula westward to Pili o Kahe. The *ahupua'a* extends *mauka* (inland) from West Loch nearly to Schofield Barracks in Wahiawā; the western boundary is the Wai'anae Mountain crest running north as far as Pu'u Hāpapa (or to the top of Ka'ala Mountain, according to some).

Topographically, the southern (south of Farrington Highway) project area is most notable for a scarp feature, typically 50 ft (15 m) high, which runs roughly north/south through the southeastern portion of the project area. This scarp is a Pleistocene fossil sea bluff. In the northern section, the land is generally flat, except along Honouliuli Gulch, which runs through the center of this project area section.

Lying in the lee of the Wai'anae mountain range, the project area is one of the driest areas of O'ahu with most of the area averaging about 18 inches of rainfall annually (Juvik and Juvik 1998:56). Temperatures range between 60° to 90° through the year; the highest temperatures are in August and September (Armstrong 1973). Elevation in the project area ranges from 40 ft (feet) AMSL (above mean sea level) to 240 ft, or 12 to 73 m (meters). The project area is located on the 'Ewa Plain, which is a Pleistocene (>38,000 years old) reef platform overlain by alluvium from the southern end of the Wai'anae Mountain Range. This alluvium supported commercial sugar cane cultivation for over a century. Honouliuli Stream extends (roughly northwest to southeast) through the center of the northern section (between I H-1 and Farrington Highway) of the main project area.

In pre-contact Hawai'i the project area would have been mostly lowland dry shrub and grassland, dominated by species such as *wiliwili* (*Erythrina sandwicensis*), *lama* (*Diospyros ferrea*), sandalwood (*Santalum* sp.), *'a'ali'i* (*Dodonea eriocarpa*), scrub *'ōhi'a* (*Metrosideros collina*) and *pili* grass (*Heteropogon contortus*). Today the non-cultivated portions of the project area are dominated by introduced species such as *kiawe* and *koa haole*. Understory plants include *'ilima ku kula* (*Sida cordifola*), cayenne vervain (*Stachytarpheta urticaefolia*), *ko'oko'olau* (*Bidens pilosa*), and morning glory (*Ipomoea indica*) (Moore and Kennedy 2002:3). The vast majority of the project area consists of plowed fields, with crops of pumpkins, squash, cucumbers, bananas, beans, and other vegetable products.

AR00027600

A total of ten soil series are found in the project area (Figure 4). The Ewa Series consists of well-drained soils in basins and on alluvial fans, developed in alluvium derived from basic igneous rock. They are nearly level to moderately sloping. These soils are used for sugarcane, truck crops, and pasture. The Helemano series consists of well-drained soils on alluvial fans and colluvial slopes on the sides of gulches, which developed in alluvium and colluvium derived from basic igneous rock. They are steep to extremely steep. These soils are used for pasture, woodland, and wildlife habitat. The Honouliuli series consists of well-drained soils on coastal plains; the soils developed in alluvium derived from basic igneous material. They are nearly level and gently sloping. These soils are used for sugarcane, truck crops, orchards, and pasture. The Kaloko Series consists of poorly drained soils on coastal plains. These soils developed in alluvium derived from basic igneous rock; the alluvium has been deposited over marly lagoon deposits. The soils are nearly level. These soils are used for irrigated sugarcane and pasture. The Kawaihapai Series consists of well-drained soils in drainageways and on alluvial fans on the coastal plains. The soils formed in alluvium derived from basic igneous rock in humid uplands. These soils are used for sugarcane, truck crops, and pasture. The Keaau Series consists of poorly drained soils on coastal plains, which developed in alluvium deposited over reef limestone or consolidated coral sand. They are nearly level and gently sloping. These soils are used for sugarcane and pasture. The Kunia Series consists of well-drained soils on upland terraces and fans; the soils developed in old alluvium. They are nearly level to moderately sloping. These soils are used for sugarcane, pineapple, homesites, and military reservations. The Molokai Series consists of well-drained soils on uplands, formed in material weathered from basic igneous rock. They are nearly level to moderately steep. These soils are used for sugarcane, pineapple, pasture, wildlife habitat, and homesites. The Waialua Series consists of moderately well drained soils on alluvial fans; these soils developed in alluvium weathered from basic igneous rock. They are nearly level to steep. These soils are used for sugarcane, truck crops, orchards, and pasture (Foote et al. 1972).

Four sections of the project area were selected for backhoe testing. Honouliuli clay, 0 to 2 percent slopes (HxA) is found adjacent to Old Fort Weaver Road where seven trenches were placed to test for the remains of a nineteenth century Catholic Church (Kapalani Church) and where one trench was placed to test for the remains of a early twentieth century plantation village (Drivers/Stable Village). This soil occurs in the lowlands along the coastal plains. Waialua silty clay, 0 to 3 percent slopes (WkA) is found adjacent (and west) of the HxA soils in the Kapalani Church testing area. This soil is found on smooth coastal plains. Waipahu silty clay, 0 to 2 percent slopes (WzA) is the dominant soil on the top of the scarp. Two areas selected for backhoe testing, the remains of PipeLine Village, and the Honouliuli Taro Lands, had this soil type. This soil is nearly level and occurs on dissected terraces near the ocean. Waipahu silty clay, 2 to 6 percent slopes (WzB) also occurred in the Honouliuli Taro Lands backhoe testing area.

1.3.2 Built Environment

In the post-contact period the project area has been mainly used as pastureland and for sugar cane irrigation and cultivation. Recently (since the 1990 survey of the project) the area has been used for produce farming.

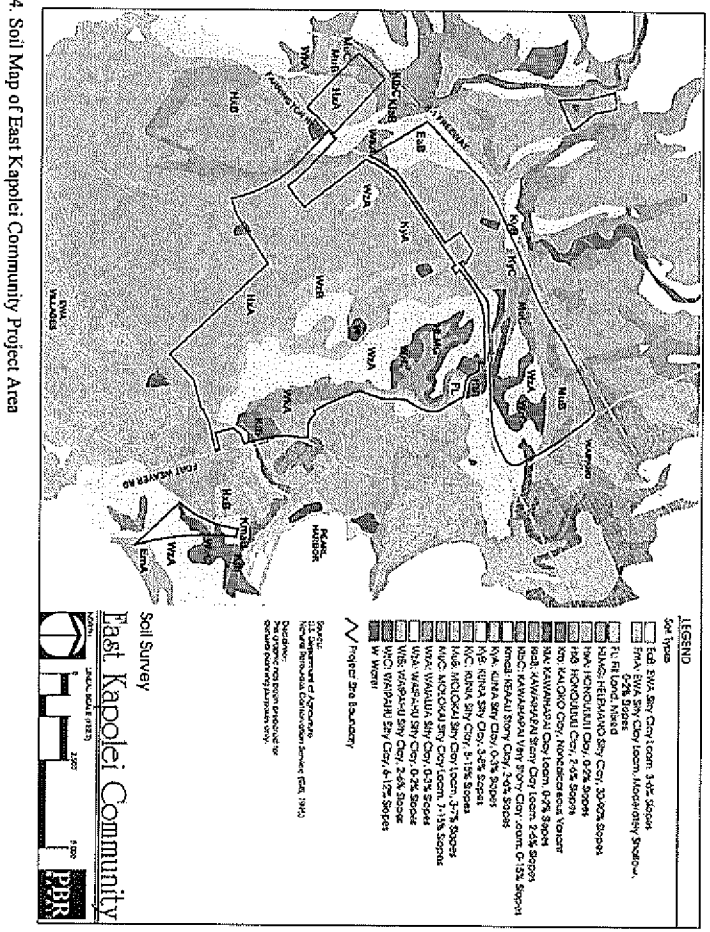

Figure 4. Soil Map of East Kapolei Community Project Area

AR00027601

Section 2 Methods

Background research included a review of previous archaeological studies on file at the State Historic Preservation Division, and a review of geology and cultural history documents at Hamilton Library at the University of Hawai'i, the Hawai'i State Archives, the Hawai'i Public Library, and the Archives of the Bishop Museum. Further research included a study of historic photographs at the Archives of the Bishop Museum and a study of historic maps at the Survey Office of the Department of Accounting and General Services. Information on LCAs was accessed through Waihona 'Āina Corporation's Māhele Data Base (www.waihona.com).

2.1 Field Methods

The pedestrian inspection of the main project area was conducted on November 21 and 22, 2005 with four Cultural Surveys Hawai'i staff archaeologists, Constance R. O'Hare, B.A., Owen O'Leary, M.A., Guadalupe Ochoa, B.A., and Brad Garrett, M.A., under the general direction of Hallett H. Hammatt, Ph.D. On January 13, 2006, the two small non-contiguous parcels of the project were surveyed (Figures 5 and 6). At least 75% of the project area has been denuded of all natural vegetation and has been recently plowed and planted with pumpkins, squash, and other vegetables (Figure 7). There are a few areas marked off for other crops, such as bananas and beans. All areas outside plowed fields were surveyed on foot. In the northern section of the project area (north of Farrington Highway) the northwest corner and a larger area to the east of Honouliuli Gulch was surveyed by pedestrian sweeps. Honouliuli Gulch was surveyed by a team of three archaeologists, one sweep moving downstream on one bank and a second sweep moving upstream on the opposite bank (Figure 8). In the southern section, the non-plowed areas surrounding the underground pipelines were surveyed. Sites previously identified during the 1990 CSH survey (Hammatt and Shideler 1990) of the eastern 546-acre parcel were revisited and additional notes were taken on their construction and their current condition.

All significant historic properties encountered were recorded and documented with a brief written field description, a sketch map, and photographs. Each site was also located using GPS survey technology. In total, in addition to the five previously identified sites found during the CSH 1990 survey (Hammatt and Shideler 1990; see Introduction section), four new features, all found along Honouliuli Gulch, were recorded. All features were initially given CSH temporary numbers (CSH 1-4), and were later given feature designations as part of a previously designated site, 50-80-12-4344, a site number used for sugar cane plantation infrastructure features.

Sub-surface testing was conducted in four specific portions of the project area; areas that could potentially contain buried cultural layers or artifacts. This testing was conducted on November 28, and December 8 and 9, 2005 by CSH archaeologists Constance R. O'Hare, B.A., Owen O'Leary, M.A., Guadalupe Ochoa, B.A., Brad Garrett, M.A., and Jon Tulchin, B.A., under the general direction of Hallett H. Hammatt, Ph.D. Subsurface testing consisted of the excavation of 19 backhoe trenches. These trenches were excavated to a total depth of 2.0-3.0 m. A 70 cm (centimeter) wide bucket was used on the backhoe, and one-bucket width trenches were dug. All excavations were closely monitored by CSH personnel. Trenches were placed to test for subsurface deposits in four specific former habitation loci, as well as to provide adequate coverage of these four areas.

Figure 5. Non-contiguous parcel east of Fort Weaver Road (TMK 9-1-001:002), showing koa haole on western half and low grass on eastern half

Figure 6. Non-contiguous parcel north of the H-1 interstate, showing bulldozed reservoir area

AR00027602

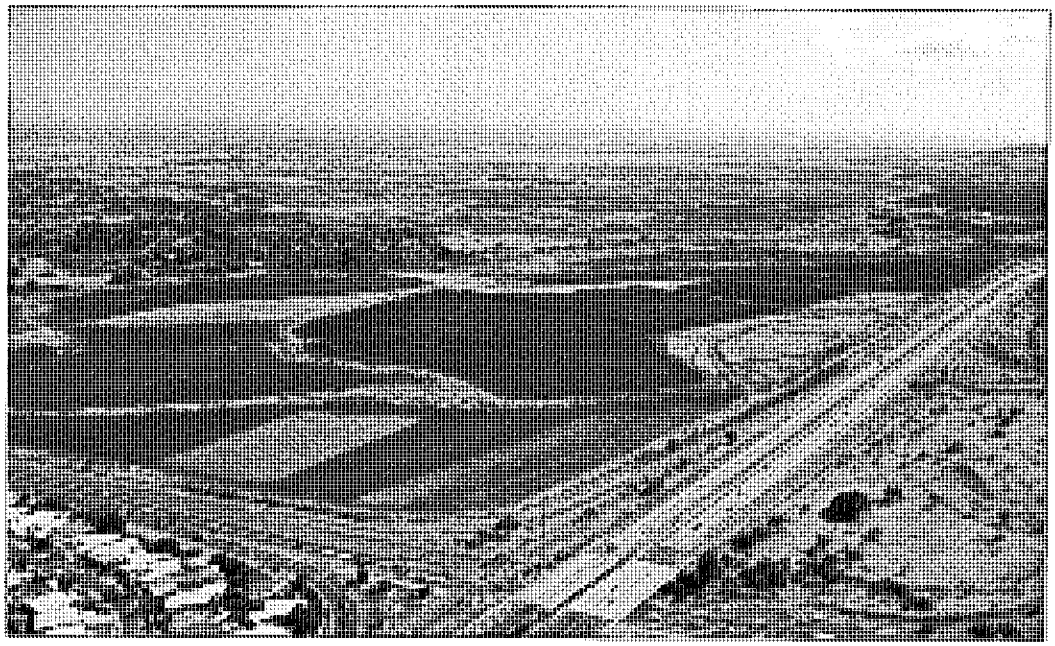

Figure 8. Aerial photograph of northern section of the project area taken near the intersection of H-1 Interstate and Fort Weaver Road; plowed fields in foreground, Honouliuli Gulch in background (shown by the alignment of trees)

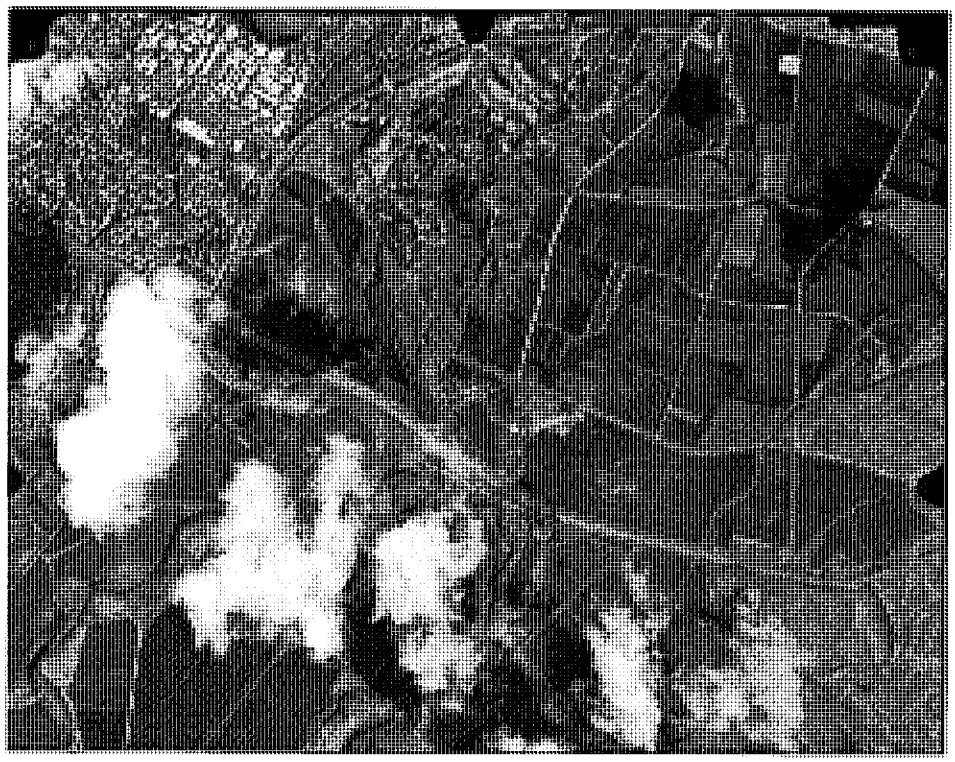

Figure 7. 2000 Aerial photograph of main project area (TMK 9-1-017, 9-1-018), showing plowed fields

AR00027603

The stratigraphy of one profile wall was drawn and photographed; sediments were described for each of the 19 trenches. Sediment descriptions include Munsell color, texture, consistence, structure, plasticity, cementation, origin of sediments, descriptions of inclusions, lower boundary distinctiveness and topography, and other general observations. Fieldwork was conducted under state archaeological fieldwork permit No. 0508 issued by SHPD, per Hawai'i Administrative Rules (HAR) Chapter 13-13-282. The field effort, the surface pedestrian survey (2 days with a crew of 3-4 people), and the subsurface testing with a backhoe required 23 person-days to complete.

2.2 Laboratory Methods

Because no archaeological artifacts were discovered, no laboratory work was undertaken.

2.3 Consultation

As partial fulfillment for the Scope of Work (SOW), consultation with organizations and the community are currently being conducted to identify *kūpuna* and other individuals with knowledge of the history of the project area and its surroundings. The results of these interviews will be presented in a companion report for this project, titled "Cultural Impact Assessment for the East Kapolei Project." The on-going consultation with organizations include the Office of Hawaiian Affairs, the O'ahu Island Burial Council, 'Ahahui Siwila Hawai'i O Kapolei Hawaiian Civic Club, 'Ewa Task Force, 'Ewa Neighborhood Board, Hawaii Plantation Village, and Immaculate Conception Church in 'Ewa. A table of informants that will be contacted is presented below:

Table 1.Contact List of Community Members and Organizations for a Cultural Impact Assessment

Name	Affiliation
Aila, William	Hui Malama
Alexander, Jeff	'Ewa Neighborhood Board Member
Bautista, Gary	'Ewa Neighborhood Board Member (Chair)
Cayan, Coochie	O'ahu Island Burial Council
Eaton, Arline	*Kūpuna* at Iroquois Elementary School
Hirata, Richard	President of Hawaii Plantation Village; he was raised at the 'Ewa Plantation
Kane, Shad	Makakilo, Kapolei, Honokai Hale Neighborhood Board Member
Malama, Tesha	Former 'Ewa Neighborhood Board member
Nāmu'o, Clyde	Administrator at Office of Hawaiian Affairs
Oshiro, Richard	Former 'Ewa Plantation employee
Paishon, Frank	Raised in Tenney Village
Ramos, Rodolfo	Chair of 'Ewa Task Force
Sato, Melvin	Raised in Ewa Plantation "C" Village
Serrao, Mary	President of Pu'uloa Outrigger Canoe Club
Soma, Millie	Raised in 'Ewa Plantation Tenney Village
Soma, Kenneth	Former 'Ewa Plantation Employee and resident
Quintal, Leti	Raised in 'Ewa Plantation Secretary for the Immaculate Conception Church

Section 3 Background Research

3.1 Mythological and Traditional Accounts

The traditions of Honouliuli Ahupua'a have been compiled by several authors, in studies by Sterling and Summers (1978), Hammatt and Folk (1981), Kelly (1991), Charvet-Pond and Davis (1992), Maly (1992), and Tuggle and Tomonari-Tuggle (1997). Some of the traditional themes associated with this area include connections with Kahiki, the traditional homeland of Hawaiians in central Polynesia. There are several versions of the chief Kaha'i leaving from Kalaeloa for a trip to Kahiki; on his return to the Hawaiian Islands he brought back the first breadfruit (Kamakau 1991a:110) and planted it at Pu'uloa, near Pearl Harbor in 'Ewa (Beckwith 1940:97). Several stories associate places in Honouliuli to the gods Kāne and Kanaloa, with the Hawaiian pig god Kamapua'a and the Hina family, and with the sisters of Pele, the Hawaiian volcano goddess, all of who have strong connections with Kahiki (Kamakau 1991a:111; Pukui et al. 1974:200). The locations of traditional places names for Honouliuli are illustrated in Figure 9.

3.1.1 The Naming of 'Ewa and Honouliuli

Honouliuli is the largest *ahupua'a* in the *moku* (district) of 'Ewa. One translation of the name for this district is given as "unequal" (*Saturday Press* Aug. 11, 1883). Others translate the word as "strayed" and associate it with the legends of the gods, Kāne and Kanaloa.

> When Kane and Kanaloa were surveying the islands they came to Oahu and when they reached Red Hill saw below them the broad plains of what is now Ewa. To mark boundaries of the land they would throw a stone and where the stone fell would be the boundary line. When they saw the beautiful land lying below them, it was their thought to include as much of the flat level land as possible. They hurled the stone as far as the Waianae range and it landed somewhere, in the Waimanalo section. When they went to find it, they could not locate the spot where it fell. So Ewa (strayed) became known by the name. The stone that strayed [Told to E.S. by Simeon Nawaa, March 22, 1954; cited in Sterling and Summers 1978:1].

Honouliuli means "dark water," "dark bay," or "blue harbor" and was named for the waters of Pearl Harbor (Jarrett 1930:22), which marks the eastern boundary of the *ahupua'a*. The Hawaiians called Pearl Harbor, Pu'uloa (*lit.* long hill). Another explanation for the names comes from the "Legend of Lepeamoa", the chicken-girl of Pālama. In this legend, Honouliuli is the name of the husband of the chiefess Kapālama and grandfather of Lepeamoa (Thrum 1923:164-184). "Her grandfather gave his name, Honouliuli to a land district west of Honolulu . . ." (Thrum 1923:170). Westervelt (1963:209) gives an almost identical account.

It seems likely the boundaries of the western-most *ahupua'a* of 'Ewa were often contested with Wai'anae people. The 'Ewa people could cite divine sanction that the dividing point was between two hills at Pili o Kahe:

AR00027604

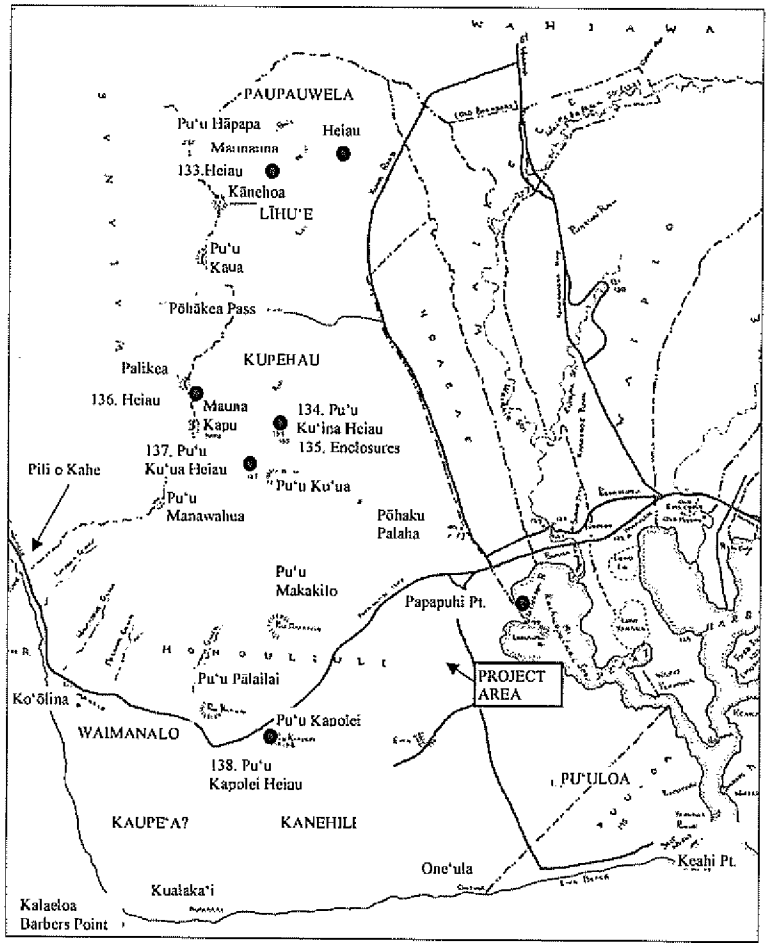

Figure 9. Place Names of Honouliuli (map adapted from Sterling and Summers 1978)

Eventually the stone was found at Pili o Kahe. This is a spot where two small hills of the Wai'anae Range come down parallel on the boundary between Honouliuli and Nānākuli ('Ewa and Wai'anae). The ancient Hawaiians said the hill on the 'Ewa side was the male and the hill on the Wai'anae side was female. The stone was found on the Waianae side hill and the place is known as Pili o Kahe.

> (Pili=cling to, Kahe=flow). The name refers, therefore, to the female or Waianae side hill. And that is where the boundary between the two districts runs [Told to E.S. by Simeon Nawaa, March 22, 1954; cited in Sterling and Summers 1978:1].

3.1.2 Pu'u o Kapolei and the Plains of Kaupa'e

Pu'uokapolei is a prominent hill at the *mauka* edge of the coastal 'Ewa Plains and was the primary landmark for travelers on the trail that ran from Pearl Harbor west to Wai'anae ('T'T 1959:27, 29; Nakuina 1992:54; E.M. Nakuina 1904, in Sterling and Summers 1978:34).

3.1.2.1 Pu'u o Kapolei, Astronomical Marker and Heiau

Pu'u means hill and Kapolei means "beloved Kapo," a reference to the sister of the Hawaiian volcano goddess, Pele. Samuel Kamakau (1976:14) says that ancient Hawaiians used Pu'uokapolei as an astronomical marker to designate the seasons. Samuel Kamakau (1870 *Mo'olelo Hawai'i* Vol. I, Chap. 2, p. 23) relates:

> . . . the people of O'ahu reckoned from the time when the sun set over Pu'uokapolei until it set in the hollow of Mahinaona and called this period Kau [summer], and when it moved south again from Pu'uokapolei and it grew cold and the time came when young sprouts started, the season was called from their germination (*'ōilo*) the season of Ho'oilo [winter, rainy, season].

A *heiau* was once on Pu'uokapolei, but had been destroyed by McAllister's (1933:108) survey of the island in the early 1930s. The hill was used as a point of solar reference or as a place for such observations (Fornander 1919, Vol. VI, Part 2:292). Pu'uokapolei may have been regarded as the gate of the setting sun, just as the eastern gate of Kumukahi in Puna is regarded as the rising sun; both places are associated with the Hawaiian goddess Kapo (Emerson 1915:41). This somewhat contradicts some Hawaiian cosmologies, in which Kū was the god of the rising sun, and Hina, the mother of Kamapua'a was associated with the setting sun. Fornander (Fornander 1919, Vol. VI, Part 2:292) states that Pu'uokapolei may have been a jumping off place (also connected with the setting sun) and associated with the wandering souls who roamed the plains of Kaupe'a and Kāne-hili, *makai* of the hill.

3.1.2.2 Pu'u o Kapolei and the Plains of Kaupe'a and Kāne-hili

Hi'iaka sang this bitter chant addressed to Lohiau and Wahine-oma'o, which uses the association of the Plains of Kaupe'a as a place for the wandering of lost souls:

> *Ku'u aikana i ke awa lau o Pu'uloa,*
> *Mai ke kula o Pe'e-kaua, ke noho oe,*
> *E noho kaua e kui, e lei i ka pua o ke kauno'a,*

AR00027605

I ka pua o ke akuli-kuli, o ka wili-wili;
O ka iho 'na o Kau-pe'e i Kane-hili,
Ua hili au; akahi no ka hili o ka la pomaika'i;
E Lohiau ipo, e Wahine-oma'o,
Hoe 'a mai ka wa'a i a'e aku au.

We meet at Ewa's leaf-shaped lagoon, friends;
Let us sit, if you will on this lea
And bedeck us with wreaths of Kauno'a,
Of akuli-kuli and wili-wili,
My soul went astray in this solitude;
It lost the track for once, in spite of luck,
As I came down the road to Kau-pe'a.
No nightmare dream was that which tricked my soul.
This way, dear friends; turn the canoe this way;
Paddle hither and let me embark
[Emerson 1915:162-163].

Several other Honouliuli places are mentioned in this chant, including Pe'e-kaua, which may be a variation of Kau-pe'e or Kaupe'a, and the plains of Kānehili, the last of which again refers to wandering, as the word *hili* means "to go astray" (Emerson 1915:162). In the chant, Hi'iaka is moving downhill from Kaupe'a, probably the plains adjacent to Pu'uokapolei, toward the coast, the plain of Kānehili.

3.1.2.3 The plains of Kaupe'a and Pu'u Kapolei and the Realm of Homeless Souls

There are several places on the 'Ewa coastal plain that are associated with *ao kuewa*, the realm of the homeless souls. Samuel Kamakau (1991b:47-49) explains the Hawaiian beliefs in the afterlife:

> . . . There were three realms (*ao*) for the spirits of the dead. . . There were, first, the realm of the homeless souls, the *ao kuewa*; second, the realm of the ancestral spirits, the *ao 'aumakua*; and third, the realm of Milu, *ke ao o Milu* . . .
>
> The *ao kuewa*, the realm of homeless souls, was also called the *ao 'auwana*, the realm of wandering souls. When a man who had no rightful place in the *'aumakua* realm (*kanaka kuleana 'ole*) died, his soul would wander about and stray amongst the underbrush on the plain of Kama'oma'o on Maui, or in the *wiliwili* grove of Kaupe'a on Oahu. If his soul came to Leilono [in Halawa, 'Ewa near Red Hill], there he would find the breadfruit tree of Leiwalo, *ka 'ulu o Leiwalo*. If it was not found by an *'aumakua* soul who knew it (*i ma'a mau iaia*), or one who would help it, the soul would leap upon the decayed branch of the breadfruit tree and fall down into endless night, *the pō pau 'olo o Milu*. Or, a soul that had no rightful place in the *'aumakua* realm, or who had no relative or friend (*makamaka*) there who would watch out for it and welcome it, would slip over the flat lands like a

> wind, until it came to a leaping place of souls, a *leina a ka 'uhane*. . . . [Kamakau 1991b:47].
>
> On the plain of Kaupe'a beside Pu'uloa [Pearl Harbor], wandering souls could go to catch moths (*pulelehua*) and spiders (*nanana*). However, wandering souls could not go far in the places mentioned earlier before they would be found catching spiders by 'aumakua souls, and be helped to escape. . . . [Kamakau 1991b:49].

The breadfruit tree Leilono was said to have been located on the 'Ewa-Kona border, above Āliamanu. In another section of his account of the dead, Kamakau calls the plain of wandering souls the "plain at Pu'uokapolei."

> There are many who have died and have returned to say that they had no claim to an 'aumakua [realm] (*kuleana 'ole*). These are the souls, it is said, who only wander upon the plain of Kama'oma'o on Maui or on the plain at Pu'uokapolei on Oahu. Spiders and moths are their food [Kamakau 1991b:29].

This association of Pu'u Kapolei and Kānehili with wandering souls is also illustrated in a lament on the death of Kahahana, the paramount chief of O'ahu, who was killed by his father, Kahekili, after Kahahana became treacherous and killed the high priest Kaopulupulu.

Go carefully lest you fall dead in the sun,	*E newa ai o hea make i ka la,*
The god that dwells on Kapolei hill.	*Akua noho la i Puuokapolei.*
The sun is wailing on account of the women of Kamao,	*E hanehane mai ana ka la i na wahine o Kamao,*
A hiding god, blossoming ohai of the banks,	*Akua pee, pua ohai o ke kaha,*
Contented among the stones-	*I walea wale i ke a-*
Among the breadfruit planted by Kahai.	*I ka ulu kanu a Kahai.*
Thou wast spoken of by the oo-	*Haina oe e ka oo-*
By the bird of Kanehili.	*E ka manu o Kanehili.*

[Fornander 1919, Vol. VI, Part 2:297]

Fornander provides some notes on this lament. The god dwelling at Kapolei is the god Kahahana, stating that this is where his soul has gone. Kamao is one of the names of the door to the underworld. This lament draws an association with wandering souls and the place where the first breadfruit tree was planted by Kahai at Pu'uloa (Fornander 1919, Vol. VI, Part 2:304).

Pukui (1983:180) offers this Hawaiian saying, which places the wandering souls in a *wiliwili* grove at Kaupe'a.

The wiliwili grove of Kaupe'a	Ka wiliwili of Kaupe'a.

In 'Ewa, O'ahu. Said to be where homeless ghosts wander among the trees.
[Pukui 1983:#1666].

Beckwith (1940:154) has stressed that "the worst fate that could befall a soul was to be abandoned by its *'aumakua* and left to stray, a wandering spirit (*kuewa*) in some barren and desolate place." These wandering spirits were often malicious, so the places that they wandered were avoided.

AR00027606

3.1.2.4 The Plain of Pukaua

The Hawaiian language newspaper *Ka Loea Kālai'āina*, (January 13, 1900) relates that near Pu'uokapolei, on the plain of Pukaua, on the *mauka* side of the road, there was a large rock. This legend suggests that the plain around Pu'u o Kapolei was called Pukaua. The legend is as follows:

> If a traveler should go by the government road to Waianae, after leaving the village of gold, Honouliuli, he will first come to the plain of Puu-ainako and when that is passed, Ke-one-ae. Then there is a straight climb up to Puu-o-Kapolei and there look seaward from the government road to a small hill, That is Puu-Kapolei. . . . You go down some small inclines, then to a plain. This plain is Pukaua and on the mauka side of the road, you will see a large rock standing on the plain. . . . There were two supernatural old women or rather peculiar women with strange powers and Puukaua belonged to them. While they were down fishing at Kualaka'i [near Barbers Point] in the evening, they caught these things, *'a'ama* crabs, *pipipi* shellfish, and whatever they could get with their hands. As they were returning to the plain from the shore and thinking of getting home while it was yet dark, they failed for they met a one-eyed person [bad omen]. It became light as they came near to the plain, so that passing people were distinguishable. They were still below the road and became frightened lest they be seen by men. They began to run - running, leaping, falling, sprawling, rising up and running on, without a thought of the *'a'ama* crabs and seaweeds that dropped on the way, so long as they would reach the upper side of the road. They did not go far for by then it was broad daylight. One woman said to the other, "Let us hide lest people see us," and so they hid. Their bodies turned into stone and that is one of the famous things on this plain to this day, the stone body. This is the end of these strange women. When one visits the plain, it will do no harm to glance on the upper side of the road and see them standing on the plain [*Ka Loea Kālai'āina*, January 13, 1900, translation in Sterling and Summers 1978:39].

In another version of this story, the two women met Hi'iaka as she journeyed toward the 'Ewa coast. The women were *mo'o* (supernatural beings) and were afraid that Hi'iaka would kill them, so they changed into their lizard form. One of the lizards hid in a little space on a stone beside the coastal trail, and the other hid nearby (*Ka Hōkū o Hawai'i*, February 15, 1927, translated in Maly 1997:19). From that time on the stone was known as *pe'e-kāua*, meaning "we two hidden." Hi'iaka greeted the two women but did not harm them, and passed on.

When she reached Pu'u o Kapolei, she also greeted two old women who lived at a *'ohai* grove on the hill. These women were named Pu'uokapolei and Nāwaineokama'oma'o (*Ka Hōkū o Hawai'i*, February 22, 1927, translated in Maly 1997:19). As she continued her travels, she looked to the ocean and saw the canoe carrying Lohi'au.

My man on the many harbored sea of Pu'uloa	*Ku'u kāne i ke awa lau o Pu'uloa*
As seen from the plain of Pe'ekāua	*Mai ke kula o Pe'ekāua ke noho*
Let us dwell upon the 'ōhai covered shore	*E noho kāua i ke kaha o ka 'ōhai*

Where the noni blossoms are twisted together	*I ka wiliwili i ka pua o ka lau noni*
Descending along Kānehili	*O ka ihona i Kānehili la*
I am winding along	*Ua hili ho'i au-e*

[*Ka Hōkū o Hawai'i*, February 22, 1927, translated in Maly 1997:20].

3.1.2.5 Pu'u Kapolei and Kamapua'a

Pu'uokapolei's was the home of Kamapua'a's grandmother, Kamaunuaniho, who was one of the three migrants from Kahiki that were ancestors to the people of O'ahu (Fornander 1919, Vol. V, Part 2:318; Kahiolo 1978:81, 107). Kamapua'a, the Hawaiian pig god, once lived in Kaluanui on the windward side, but escaped to 'Ewa when he was pursued by the chief Olopana.

> Kamapua'a subsequently conquered most of the island of O'ahu, and, installing his grandmother [Kamaunuaniho] as queen, took her to Pu'uokapolei, the lesser of the two hillocks forming the southeastern spur of the Wai'anae Mountain Range, and made her establish her court there. This was to compel the people who were to pay tribute to bring all the necessities of life from a distance, to show his absolute power over all [Nakuina 1904:50-51].

Emma Nakuina goes on to note: "A very short time ago [prior to 1904] the foundations of Kamaunuaniho's house could still be seen at Pu'uokapolei." Another account (*Ka Loea Kālai'āina* January 13, 1900, from Sterling and Summers 1978:34) speaks of Kekelcaiku, the older brother of Kamapua'a, who also lived on Pu'uokapolei.

3.1.2.6 The Strife at Honouliuli; Kūali'i unites Hawai'i nei (Mo'olelo o Kūali'i)

The celebrated chief, Kūali'i, is said to have led an army of twelve thousand (*'ekolu mano*) against the chiefs of Ko'olauloa with an army of twelve hundred (*'ekolu lau*) upon the plains of Keahumoa (Fornander 1917 Vol. IV, Part 2:364-401). Perhaps because the odds were so skewed the battle was called off and the *ali'i* of Ko'olau ceded (*ha'awi a'e*) the districts of Ko'olauloa, Ko'olaupoko, Waialua and Wai'anae to Kūali'i. When the *ali'i* of Kaua'i heard of this victory at Honouliuli they gave Kaua'i to Kūali'i as well and thus he became possessed of all the islands (*a lilo a'e la nā moku a pau ia Kūali'i mai Hawai'i a Ni'ihau*). The strife at Honouliuli was the occasion of the recitation of a song for Kūali'i by a certain Kapa'ahulani (*Ka Pule Ana a Kapa'ahulani*). This *mele* compares the king to certain places and objects in the islands, in this instance to the first breadfruit planted by Kahai at Pu'uloa, and a pig and a woman on Pu'u Kapolei, possibly a reference to Kamapua'a and his grandmother.

Not like these art thou, Ku.	*Aole I like Ku.*
Not like the pig	*Aole I like i ka puaa,*
Discerning the progeny of the god;	*I ka weke lao a ke akua,*
[Or] The breadfruit planted by Kahai.	*Ka ulu kanu o Kahai;*
Truly, have you not known	*Oi ole ka oe i ike,*
The woman with the dyed garment,	*Ka wahine pau mao*
On the top of Puuokapolei?	*I ka luna o Puuokapolei-la?*

[Fornander 1917, Vol. IV, Part 2:392-393].

AR00027607

A later section of this *mele* also refers to Pu'u o Kapolei and makes mention of the famous blue poi of Honouliuli.

O Kawelo! Say, Kawelo!	*O Kawelo-e, e Kawelo-e,*
Kawelokiki, the sharp-pointed hill,	*O Kawelaiki puu oioi,*
Hill of Kapolei.	*Puu of Kapolei-e-*
Blue is the poi which appeases [the hunger] of Honouliuli.	*Ulituli ka poi e piha nei-o Honouliuli;*

[Fornander 1917, Vol. IV, Part 2:400-401].

3.1.3 Pearl Harbor (Pu'uloa) and West Loch (Kaihu o pala'ai)

3.1.3.1 The "Silent Fish" of Pearl Harbor

Pearl Harbor was called Pu'uloa or *ke-awa-lau-o-Pu'uloa*, the many harbored-sea of Pu'uloa (Pukui 1983:#1686) by the Hawaiians. An alternate name was Awawa-lei, or "garland (*lei*) of harbors" (Handy and Handy 1972:469). Pukui (1983:#1126] also uses the name *Awalua* for Pearl Harbor, as in the saying "*Huhui na 'ōpua i Awalau*, The clouds met at Pearl Harbor. Said of the mating of two people." Emerson (1915:167) interprets Awalau as "leaf-shaped lagoon."

John Clark (1977:70) says that its English name came from the name Waimomi, or "water of the pearl," an alternate name for the Pearl River (Pearl Harbor). The harbor was named Pearl Harbor after the pearl oysters of the family Pteriidae (mainly *Pinctada radiata*), which were once abundant on the harbor reefs, but were later decimated by over-harvesting. This oyster was supposedly brought from Kahiki, the Hawaiian ancestral lands, by a *mo'o* (lizard or water spirit) named Kane-kua'ana (Handy and Handy 1972:470).

Kanekua'ana was the *kia'i* (food guardian) for 'Ewa. When food was scarce, the descendants of Kanekua'ana built *waihau heiau* (a *heiau* for *mo'o*) for her and lit fires to plead for her blessings. For 'Ewa, the chief *i'a* (marine food) blessing was the famous *pipi*, or pearl oyster. Samuel Kamakau describes the *pipi* of Honouliuli.

> That was the oyster that came in from deep water to the mussel beds near shore, from the channel entrance of Pu'uloa to the rocks along the edges of the fishponds. They grew right on the *nahawele* mussels and thus was this *i'a* obtained. Not six months after the *han* branches [that placed a *kapu* on these waters until the *pipi* should come up] were set up, the *pipi* were found in abundance-enough for all 'Ewa-and fat with flesh. Within the oyster was a jewel (*daimana*) called a pearl (*momi*), beautiful as the eyeball of a fish, white and shining; white as the cuttle fish, and shining with the colors of the rainbow-reds and yellow and blues, and some pinkish white, ranging in size from small to large. They were of great bargaining value (*he waiwai kunuku'ai nui*) in the ancient days, but were just "rubbish" (*'opala*) in 'Ewa [Kamakau 1991b:83].

This oyster, the *pipi*, was sometimes called "the silent fish," or *i'a hamau leo o 'Ewa*, 'Ewa's silent sea creature (Handy and Handy 1972:471), since the collectors were supposed to stay quiet while harvesting the shells, as in the sayings:

> The fish of 'Ewa that silences the voice. *Ka ka'a hāmau leo o 'Ewa.*
> The pearl oyster, which has to be gathered in silence [Pukui 1983:#1331].

> 'Ewa is disturbed by the Moa'e wind. *Haumāele 'Ewa i ka Moa'e.*
> Used about something disturbing, like a violet argument. When the people of 'Ewa went to gather the *pipi* (pearl oyster), they did so in silence, for if they spoke, a Moa'e breeze would suddenly blow across the water, rippling it, and the oysters would disappear [Pukui 1983:5#493].

> Hush, lest the wind rise. *E hāmou o makani mai auane'i.*
> Hold your silence or trouble will come to us. When the people went to gather pearl oysters at Pu'uloa, they did so in silence, for they believed that if they spoke, a gust of wind would ripple the water and the oysters would vanish [Pukui 1983:#274].

> The gesturing fish of 'Ewa. *Ka i'a kuhi lima o 'Ewa.*
> The *pipi*, or pearl oyster. Fishermen did not speak when fishing for them but gestured to each other like deaf-mutes [Pukui 1983:#1357].

Sereno Bishop, an early resident of O'ahu, wrote, of his time in the area around 1836, of the pearl oyster, the *pipi*, and another edible clam, identified by Margaret Titcomb (1979:351) as probably *Lioconcha heiraglyphica.*

> The lochs or lagoons of Pearl River were not then as shoal as now. The subsequent occupation of the uplands by cattle denuded the country of herbage, and caused vast quantities of earth to be washed down by storms into the lagoons, shoaling the water for a long distance seaward. No doubt the area of deepwater and anchorage has been greatly diminished. In the thirties, the small oyster was quite abundant, and common on our table. Small pearls were frequently found in them. No doubt the copious inflow of fresh water favored their presence. I think they have become almost entire extinct, drowned out by the mud. There was also at Pearl River a handsome speckled clam, of a delicate flavor which contained milk white pearls of exquisite luster and perfectly spherical. I think the clam is still found in the Ewa Lochs [Bishop 1901:87].

Older Hawaiians believed that the *pipi* disappeared around the time of the smallpox epidemic of 1850-1853, because Kanekua'ana became displeased at the greed of some *konohiki* (overseer).

> The people of the place believe that the lizard was angry because the konohikis imposed kapus [bans], were cross with the women and seized their catch of oysters. So this "fish" was removed to Tahiti and other lands. When it vanished a white, toothed thing grew everywhere in the sea, of Ewa, which the natives of Ewa had named the pahikaua (sword). It is sharp edged and had come from Kauai-helanai, according to this legend [Manu 1885:50].

Pahikaua is the Hawaiian name for the mussel, *Brachidontes crebristriatus* (Mytilidae), which was also a popular clam eaten by the residents of Pearl Harbor.

AR00027608

A clarification of the story of Kanekua'ana and the pearl oysters of Pearl Harbor is given, in which it seems an overseer had set a ban on the *pipi* for several months a year so that they could increase. A poor widow, a relation of the *mo'o*, took some of the *pipi* and hid them in a basket. The *konohiki* found the hidden shells, and took them from her, emptying them back into the sea, which was proper. However, after this he followed the woman home and also demanded that she pay a stiff fine in cash, which she did not have. The *mo'o* thought this was unjust and the next night she took possession of a neighbor who was a medium.

> . . . After the overseer had gone back to Palea the lizard goddess possessed her aged keeper [a woman of Ewa] and said to those in the house, "I am taking the pipi back to Kahiki and they will not return until all the deseendants of this man are dead. I go to sleep. Do not awaken my medium until she wakes of her own accord." The command was obeyed and she slept four days and four nights before she awoke. During the time that she slept the pearl oysters vanished from the places where they were found in great numbers, as far as the shore . . . .The few found today are merely nothing . . . [*Ka Loea Kālai'āina*, June 3, 1899, translation in Sterling and Summers 1978:49-50].

3.1.3.2 Kāne and Kanaloa and the Fish Ponds of West Loch

According to an account in the Hawaiian newspaper *Ka Loea Kālai'āina* (June 10, 1899), several of the fishponds in the Pu'uloa area were made by the brother gods, Kāne and Kanaloa. A fisherman living in Pu'uloa, named Hanakahi, prayed to unknown gods, until one day two men came to his house. They revealed to him that they were the gods to whom he should pray. Kāne and Kanaloa then built fishponds at Ke'ana-pua'a, but were not satisfied. Then they built the fishpond, Kepo'okala, but were still not satisfied. Finally they made the pond Kapākule, which they stocked with all manner of fish. They gifted all of these fishponds to Hanakahi and his descendants (Handy and Handy 1972:473; *Ka Loea Kālai'āina*, July 8, 1899).

According to Mary Pukui (1943:56-57), who visited Kapākule fishpond when she was young, the pond was built by the legendary little people of Hawai'i, the *menehune*, under the direction of the gods Kāne and Kanaloa. Pukui describes several unique aspects of this pond:

> On the left side of the pond stood the stone called Hina, which represented a goddess of the sea by that by that name. Each time the sea ebbed, the rock became gradually visible, vanishing again under water at high tide. Ku, another stone on the right, was never seen above sea level. This stone represented Ku'ula, Red Ku, a god for fish and fishermen. From one side of the pond a long wall composed of driven stakes of hard wood, ran toward the island [Laulaunui] in the lochs. When the fish swam up the channel and then inside of this wall, they invariably found themselves in the pond. A short distance from the spot where the pond touched the shore was a small koa or altar composed of coral rock. It was here that the first fish caught in the pond was laid as an offering to the gods [Pukui 1943:56].

The fishpond contained many fish, especially the *akule* (scad fish, *Trachurops crumenophthalmus*), thus its name, "the enclosure for *akule* fish" (Pukui 1943:56-57). The pond was destroyed when the channel to Pearl Harbor was dredged in the early twentieth century. The

caretaker of the pond took the stones Kū and Hina to a deep place in the ocean and sunk them so "none would harm or defile them." Cobb (1903:733) says it was used to catch the larger *akule* (goggler), *opelu* (mackeral scad), *weke* (goat fish), *kawakowa* (bonito), and sharks; it was unusual for having walls made of coral. This contradicts much of the legendary material that says that sharks were not killed within Pearl Harbor; however, Kamakau does relate that Kekuamanoha and Kauhiwawaeono, two conspirators against Kamehameha I, lived at Pu'uloa. The chief Kauhiwawaeono was known to murder people and use their bodies as shark bait (Kamakau 1961:182, 232).

Samuel Kamakau adds more information on the pond Kapākule, and a second one called Kepo'okala.

> At Pu'uloa on Oahu were two unusual ponds [fish traps]—Kapakule and Kepoolala. Kapakule was the better one. The rocks of its walls, *kuapa*, could be seen protruding at high tide, but the interlocking stone walls (*pae niho pohaku*) of the other pond were still under water at high tide. . . . It [Kapakule] was said to have been built by the *'e'epa* people [mysterious people] at the command of Kane ma . . .
>
> This is how the fish entered the pond. At high tide many fish would go past the mauka side of the pond, and when they returned they would become frightened by the projecting shadows of the trunks, and would go into the opening. The fish that went along the edge of the sand reached the seaward wall, then turned back toward the middle and entered the *anapuna* (the arched portion of the trap) A man ran out and placed a "cut-off" seine net (*'omuku lau*) in the opening, and the fish shoved and crowded into it. The fish that were caught in the net were dumped out, and those not caught in the net were attacked with sharp sticks and tossed out, or were seized by those who were strong [Kamakau 1976:88].

3.1.3.3 The Story of Kaihuopala'ai Pond, Honouliuli (Ka'ao no Maikohā)

In the Legend of Maikohā (Fornander 1917, Vol. V, Part 2:270-271), a sister of Maikohā, a deified hairy man who became the god of *tapa* makers, named Kaihuopala'ai, journeys to O'ahu:

> Kaihuopala'ai saw a goodly man by the name of Kapapaapuhi who was living at Honouliuli, 'Ewa; she fell in love with him and they were united, so Kaihuopala'ai has remained in 'Ewa to this day. She was changed into that fishpond in which mullet are kept and fattened, and that fish pond is used for that purpose to this day
>
> *'Ike aku la o Kaihuopala'ai i ka maikai o Kapapaapuhi, he kāne e noho ana ma Honouliuli ma 'Ewa. Moe iho la lāua, a noho iho la o Kaihuopala'ai i laila a hiki i kēia lā. 'Oia kēlā loko kai e ho'opuni ia nei i ka 'anae, nona nā i'a he nui loa, a hiki i kēia kākau ana* [Fornander 1919, Vol. V, Part 2:270].

The name of Maikohā's sister, Kaihu o pala'ai, which means "the nose of Pala'ai" (Pukui et al. 1974:68) is also the name the Hawaiians used for the west loch of Pearl Harbor, adjacent to

AR00027609

the current study area. McAllister recorded that other Hawaiians say there never was a fishpond by that name. Beckwith (1918) says that Kaihuopala'ai changed into the fishpond near Kapapapuhi, which means "the eel flats." This is identified on old maps as the point northeast of the current study area (sometimes spelled Kapapa'apuhi) that juts into the loch; early Hawaiian settlement was focused on this area.

There is also a famous *pōhaku*, or rock, associated with the traveling mullet of Pearl Harbor.

> . . . I . . . asked the person sitting on my left, "What place is this?" Answer – "This is Pearl City." It was here that mullets were bred in the ancient times and that flat stone there was called Mullet Rock or Pōhaku Anae. It lies near the beach by Ewa mill [*Ka Nūpepa Kū'oko'a*, Oct. 2, 1908, from Sterling and Summers 1978:53].

3.1.3.4 The Traveling Mullet of Honouliuli (Fish Stories and Superstitions)

The story of Kaihuopala'ai, or Ihuopala'ai, is also associated with the tradition of the *anae-holo*, the traveling mullet of Pearl Harbor (Thrum 1998:270-272):

> The home of the *'anae-holo* is at Honouliuli, Pearl Harbor, at a place called Ihuopala'ai. They make periodical journeys around to the opposite side of the island, starting from Pu'uloa and going to windward, passing successively Kumumanu, Kalihi, Kou, Kālia, Waikīkī, Ka'alāwai, and so on, around to the Ko'olau side, ending at Lā'ie, and then returning by the same course to their starting point [Thrum 1998:271].

In Thrum's account, Ihupala'ai is a male who possesses a Kū'ula or fish god that supplied the large mullet known as "*onae*." His sister lived in Lā'ie, and there came a time when there were no fish to be had. She sent her husband to visit Ihupala'ai, who was kind enough to send the fish following his brother-in-law on his trip back to Lā'ie.

This story is associated with a proverb or poetical saying identified with Honouliuli:

> The fish fetched by the wind. *Ka I'a hali a ka makani*
> The *'anaeholo*, a fish that travels from Honouliuli, where it breeds, to Kaipāpa'u, on the windward side of O'ahu. It then turns about and returns to its original home. It is driven closer to shore when the wind is strong [Pukui 1983:#1330].

Pukui et al. (1974:68) gives the name of the husband in this story as Lā'ie and the name of the wife as Pala'ai, which ties into the name of the west loch of Pearl Harbor, called Ka-ihu o Pala'ai, "the nose of Pala'ai." Another version has a woman named Awawalei (an alternate version for the name of Pearl Harbor), who had a brother named Laniloa (the point on Lā'ie at which the mullet stops its migration and makes its way back to Pearl Harbor), and another brother (a mullet) who lived with an eel named Papa-puhi, which relates to the name of the fishpond in the tale called Kapapapuhi (*Ka Loea Kālai'āina*, Oct. 21, 1899). On historic maps, Kapapapuhi is a point of land that juts into West Loch and was a focus for habitation, taro cultivation, and fishpond maintenance in the early post-Contact (and probably earlier) period.

3.1.3.5 The Caves of Pu'uloa

'Ewa was famous for the many limestone caves formed in the uplifted coral. Some of these caves, called *ka-lua-ōlohe* were inhabited by the *ālohe*, a type of people that looked like other humans but had tails like dogs (Beckwith 1940:343). These people were skilled in wrestling and bone-breaking and often hid along narrow passes to rob travelers; they were also reputed to be cannibals. The famous cannibal king, Kaupe, who lived in Lihu'e in upland Honouliuli, was an *ōlohe*.

There was once a cave named Kapuna on Waipi'o peninsula that was associated with a famous riddle. *No Kapuna kane hale noho ia e ke kai*, or "To Kapuna belongs the house, the sea dwells in it."

> This cave is on the Waipio side and a sea passage separates Waipio and Waikele and Waikele and Honouliuli. The passage is obstructed by three small islands, a middle one and Manana and Laulaunui. These small islands in the middle of the passage to Honouliuli and inside and outside of these small islands is the sea of Kaihuopalaai [Hawaiian name for West Loch] where mullet lived till they whitened with age [*Ka Loea Kālai'āina*, Oct. 7, 1899, translation in Sterling and Summers 1978:24].

Another famous cave of the area was Keanapua'a [in Halawa opposite Waipi'o peninsula], which means "the pig's cave," so named because Kamapua'a once slept there (Pukui et al. 1974:103). This cave was one of the places where the high king of O'ahu, Kahahana, hid after he had killed the priest Kaopulupulu, thus angering the high chief of Maui, Kahekili (Kahahana's father).

> Upon the arrival here at Oahu of Kahekili, Kahahana fled, with his wife Kekuapoi, and friend Alapai, and hid in the shrubbery of the hills. They went to Aliomanu, Moanalua, to a place called Kinimakalehua; them moved along to Keanapuaa and Kepookala, at the lochs of Puuloa, and then from there to upper Waipio; thence to Wahiawa, Helemano, and on to Lihue; thence the came to Poohilo, at Honouliuli, where they first showed themselves to the people and submitted themselves to their care.
>
> Through treachery, Kahahana was induced to leave Po'ohilo, Honouliuli and was killed on the plains of Hō'ae'ae [Thrum 1906:213-214].

The place Pō'o Hilo was somewhere on the border between Honouliuli and Hō'ae'ae (north of the current study area). In the "Legend of the Sacred Spear-point" (Kalākaua 1990:209-225) is a reference to the Hawai'i Island chief, Hilo-a-Lakapu. Following his unsuccessful raid against O'ahu "he was slain at Waimano, and his head was placed upon a pole near Honouliuli for the birds to feed upon"(Kalākaua 1990:224). This place was called Pō'o Hilo, which literally means "the head of Hilo."

The caves of Pu'uloa were sometimes used as burial caves. In 1849, Keali'iahonui, son of Kaua'i's last king, Kaumuali'i, died. He had once been married to the chiefess Kekau'ōnohi, who had stayed with him until 1849. She wanted to bury her ex-husband at sea.

AR00027610

> It seems that by Kekauonohi's orders, the coffin containing her late husband's remains was removed to Puuloa, Ewa, with the view of having it afterwards taken out to sea and there sunk. It was temporarily deposited in a cavern in the coral limestone back of Puuloa, which has long been used for a burial place, and has lately been closed up [Alexander 1907:27].

After some initial objections by the niece of Kealaiʻiahonui, the body was removed from the outer coffin, the rest was sunk, and the coffin was later buried somewhere in Puʻuloa.

3.2 Historic Background

3.2.1 Pre-Contact and Early Post-Contact Period

By ca. A.D. 1320, ʻEwa, along with Kona, and Koʻolaupoko were the dominant polities, ruled by the sons of a chief named Māweke (Cordy 2002:21). ʻEwa at this time included the traditional districts of ʻEwa, Waiʻanae, and Waialua (Fornander 1880:48). Around A.D. 1400, the entire island was ruled by King Laʻakona; chiefs within his line, the Māweke-Kumuhonua line, reigned until about A.D. 1520-1540, with their major royal center in Līhuʻe, in ʻEwa. (Cordy 2002:24). Haka was the last chief of the Māweke-Kumuhonua line; he was slain by his men at the fortress of Waewae near Līhuʻe (Kamakau 1991a:54-54; Fornander 1880:88). Power shifted between the chiefs of different districts from the 1500s until the early 1700s, when Kūaliʻi achieved control of all of Oʻahu by defeating the Kona chiefs, then the ʻEwa chiefs, and then expanding his control on windward Kauaʻi. Peleiholani, the heir of Kūaliʻi, gained control of Oʻahu ca. 1740, and later conquered parts of Molokaʻi. He was ruler of Oʻahu until his death in ca. 1778 when Kahahana, of the ʻEwa line of chiefs was selected as the ruler of Oʻahu (Cordy 2002:24-41).

After Kamehameha's Oʻahu victory, he gave the *ahupuaʻa* of Honouliuli to Kalanimōkū as part of the *panalāʻau*, or conquered lands, with the right to pass the land on to his heirs rather than having it revert to Kamehameha (Kameʻeleihiwa 1992:58, 112). Kalanimōkū subsequently gave the *ahupuaʻa* to his sister, Wahinepiʻo.

Various Hawaiian legends and early historical accounts indicate that the *ahupuaʻa* (land division) of Honouliuli was once widely inhabited by pre-Contact populations, including the Hawaiian *aliʻi* (chiefly class). This would be attributable for the most part to the plentiful marine and estuarine resources available at the coast, along which several sites interpreted as permanent habitations and fishing shrines have been located. Other attractive subsistence-related features of the *ahupuaʻa* include irrigated lowlands suitable for wetland taro cultivation, as well as the lower forest area of the mountain slopes for the procurement of forest resources. Handy and Handy (1972:429) report:

> The lowlands, bisected by ample streams, were ideal terrain for the cultivation of irrigated taro. The hinterland consisted of deep valleys running far back into the Koʻolau range. Between the valleys were ridges, with steep sides, but a very gradual increase of altitude. The lower part of the valley sides were excellent for the cultivation of yams and bananas. Farther inland grew the ʻawa for which the area was famous.

In addition, breadfruit, coconuts, *wauke* (paper mulberry; *Broussonetia papyrifera*), bananas, and *olona* (*Touchardia latifolia*) and other plants were grown in the interior. ʻEwa was known as one of the best areas to grow gourds and was famous for its *manaki*. It was also famous for a rare taro called the *kai o ʻEwa*, which was grown in mounds in marshy locations (Handy and Handy 1972:471). The cultivation of this prized and delicious taro led to the saying:

> He has eaten the Kāī-koi taro of ʻEwa. *Ua ʻai i ke kāī-koi o ʻEwa.*
> Kāī is Oʻahu's best eating taro; one who has eaten it will always like it. Said of a youth of a maiden of ʻEwa, who, like the Kāī taro, is not easily forgotten [Pukui 1983:#2770].

The lochs of Pearl Harbor were ideal for the construction fishponds and fishtraps. Forest resources along the slopes of the Waiʻanae Range probably acted as a viable subsistence alternative during times of famine and/or low rainfall (Handy 1940:211; Handy and Handy 1972:469-470). The upper valley slopes may have also been a resource for sporadic quarrying of basalt used in the manufacturing of stone tools. At least one probable quarrying site (SIHP site 50-80-12-4322) is present in Makaʻīwa Gulch at 152 m (500 ft) above mean sea level (Haminatt, Robins, et al. 1990).

John Papa ʻĪʻī describes a network of Leeward Oʻahu trails (Figure 10), which in historic times encircled and crossed the Waiʻanae Range, allowing passage from Lualualei to Honouliuli by three different trails (ʻĪʻī 1959:96-98). The coastal trail skirted Pearl Harbor, passing by Puʻu o Kapolei; this would have been the nearest of three Honouliuli trails to the current project area. Following ʻĪʻī's description, a portion of this trail network would have passed close to the existing Farrington Highway, near the north border of the project area, as seen in an 1825 map (Figure 11) map of the south coast of Oʻahu by Charles Malden of the British ship the *Blonde*.

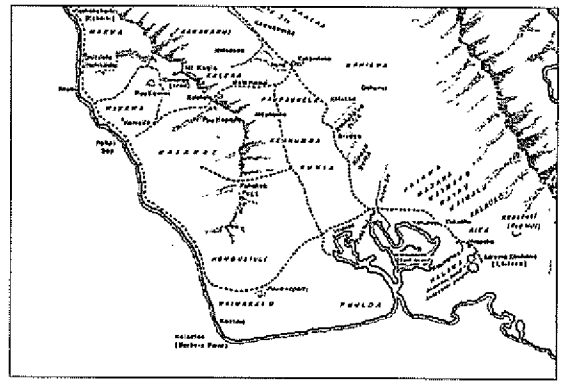

Figure 10. Trails of Leeward Oahu. Map by Paul Rockwood. (ʻĪʻī 1959:96) Mid- to late-1800s

AR00027611

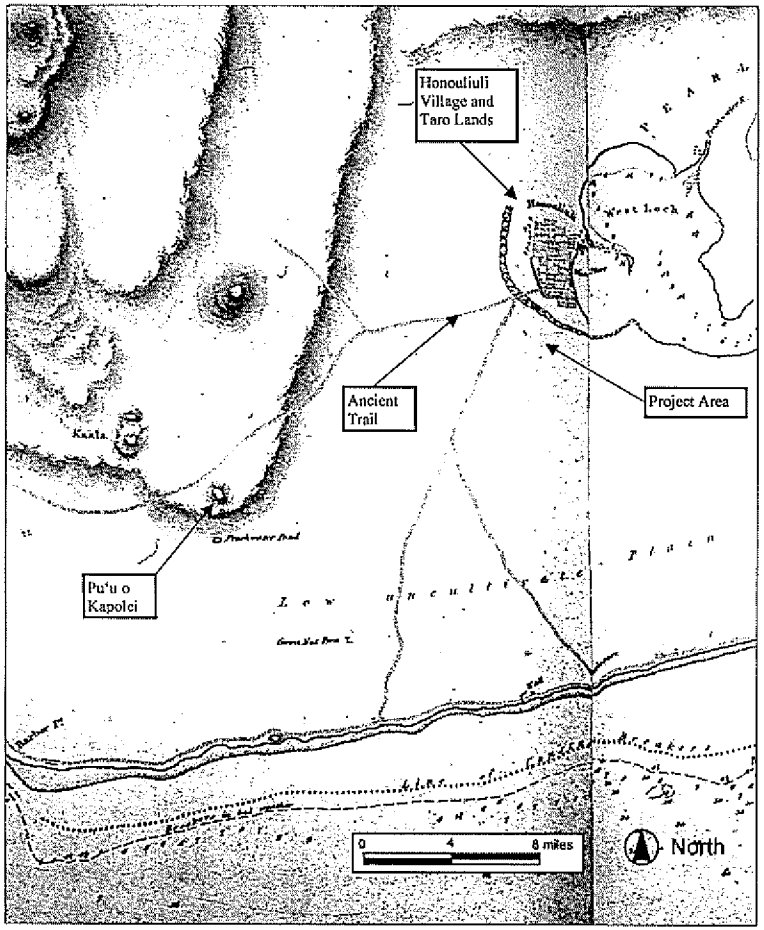

Figure 11. Portion of 1825 Map of the South Coast of Woahoo (O'ahu) and Honolulu by Lieut. C.R. Malden from the British ship the *Blonde*

The trail is described by 'Ī'ī as:

> The trail went down to the stream and up again, then went above the taro patches of Waiau, up to a *makai* field, to Waimano, to Manana, and to Waiawa; then to the stream of Kukehi and up to two other *maika* fields, Puеohulunui and Haupuu. At Puеohulunui was the place where a trail branched off to go Waialua and down to Honouliuli and on to Waianae. As mentioned before, there were three trails to Waianae, one by way of Pu'u o Kapolei, another by way of Pohakea, and the third by way of Kolekole ['Ī'ī 1959:97].

Early historical accounts of the general region typically refer to the more populated areas of the 'Ewa district, where missions and schools were established and subsistence resources were perceived to be greater. However, the presence of archaeological sites along the barren coral plains and coast of southwest Honouliuli Ahupua'a, indicate that prehistoric and early historic populations also adapted to less inviting areas, despite the environmental hardships.

3.2.2 Observations of Early Explorers and Foreign Residents

Captain Vancouver sailed by Kalaeloa (Barbers Point) in 1792, and recorded his impression of the small coastal village of Kualaka'i and the arid Honouliuli coast.

> The point is low flat land, with a reef round it . . . Not far from the S.W. point is a small grove of shabby cocoa-nut trees, and along these shores are a few struggling fishermen's huts [Vancouver 1798, Vol. I:167].
>
> . . . from the commencement of the high land to the westward of Opooroah [Pu'uloa], was composed of one very barren rocky waste, nearly destitute of verdure, cultivation or inhabitants, with little variation all the way to the west point of the island . . . [Vancouver 1798, Vol. II:217].
>
> . . . This tract of land was of some extent but did not seem to be populous, nor to possess any great degree of fertility; although we were told that at a little distance from the sea, the soil is rich, and all necessaries of life are abundantly produced . . . [Vancouver 1798, Vol. III:361-363].

Archibald Campbell, an English seamen who was given some land in Waimano Ahupua'a by King Kamehameha in 1809, described his land around Pearl Harbor:

> In the month of November the king was pleased to grant me about sixty acres of land, situated upon the Wymummee [traditional Hawaiian name for Pearl River], or Pearl-water, an inlet of the sea about twelve miles to the west of Hanaroora [Honolulu]. . . . We passed by footpaths, winding through an extensive and fertile plain, the whole of which is in the highest state of cultivation. Every stream was carefully embanked, to supply water for the taro beds. Where there was not water, the land was under crops of yams and sweet potatoes [Campbell 1967:103-104].

AR00027612

> Pearl and mother of-pearl shells are found here in considerable quantity. Since the king has learned of their value, he has kept the fishing to himself, and employs divers for the purpose [Campbell 1967:114-115].

Subsequent to western contact in the area, the landscape of the 'Ewa plains and Wai'anae slopes was adversely affected by the removal of the sandalwood forest, and the introduction of domesticated animals and new vegetation species. Domesticated animals, including goats, sheep and cattle, were brought to the Hawaiian Islands by Vancouver in the early 1790s, and allowed to graze freely about the land for some time after. It is unclear when the domesticated animals were brought to O'ahu; however, L.A. Henke reports the existence of a longhorn cattle ranch in Wai'anae by at least 1840 (Frierson 1972:10). During this same time, perhaps as early as 1790, exotic vegetation species were introduced to the area. These typically included vegetation best suited to a terrain disturbed by the logging of sandalwood forest and eroded by animal grazing. Within the current project area, the majority of the (non-cultivated) vegetation is comprised of introduced species, mainly grasses.

At contact, the most populous *ahupua'a* on the island was Honouliuli, with the majority of the population centered on Pearl Harbor. In 1832, a missionary census of Honouliuli recorded the population as 1,026. Within four years the population was down to 870 (Schmitt 1973:19, 22). In 1835, there were eight to ten deaths for every birth (Kelly 1991:157-158). Between 1848 and 1853, there was a series of epidemics of measles, influenza, and whooping cough that often wiped out whole villages. In 1853, the population of 'Ewa and Wai'anae combined was 2,451 people. In 1872, it was 1,671 (Schmitt 1968:71). The inland area of 'Ewa was probably abandoned by the mid-nineteenth century, due to population decline and consolidation of the remaining people in the town of Honouliuli (at Papapuhi Point, northeast of the project area). A detailed discussion of the historic population counts in the 'Ewa District has been presented by Charvet-Pond and Davis (1992).

The first mission station in Ewa was established in 1834 at Kalua'aha near Pearl Harbor. Charles Wilkes, of the U.S. Exploring Expedition visited the missionary enclave at Honouliuli town in 1840.

> At Ewa, Mr. Bishop has a large congregation. The village comprises about fifty houses, and the country around is dotted with them. . . . The natives have made some advance in the arts of civilized life; there is a sugar-mill which, in the season, makes two hundred pounds of sugar a day. . . . In 1840, the church contained nine hundred members, seven hundred and sixty of whom belonged to Ewa, the remainder to Waianae; but the Catholics have now established themselves at both these places, and it is understood are drawing off many from their attendance on Mr. Bishop's church [Wilkes 1970:80-81].

The earliest detailed map of the area (Alexander 1873; Figure 12) shows no habitation closer than the western edge of West Loch in the vicinity of Papapuhi Point. A Monsarrat survey map of 1878 documents substantial settlement at the "Honouliuli Taro Land" in the Papapuhi Point area, and it seems clear that in early historic times, this was the focus of the population of Honouliuli. The amenities of the area - including fishponds, taro *lo'i*, abundant shellfish, and salt pans - would have focused population there in pre-Contact times as well.

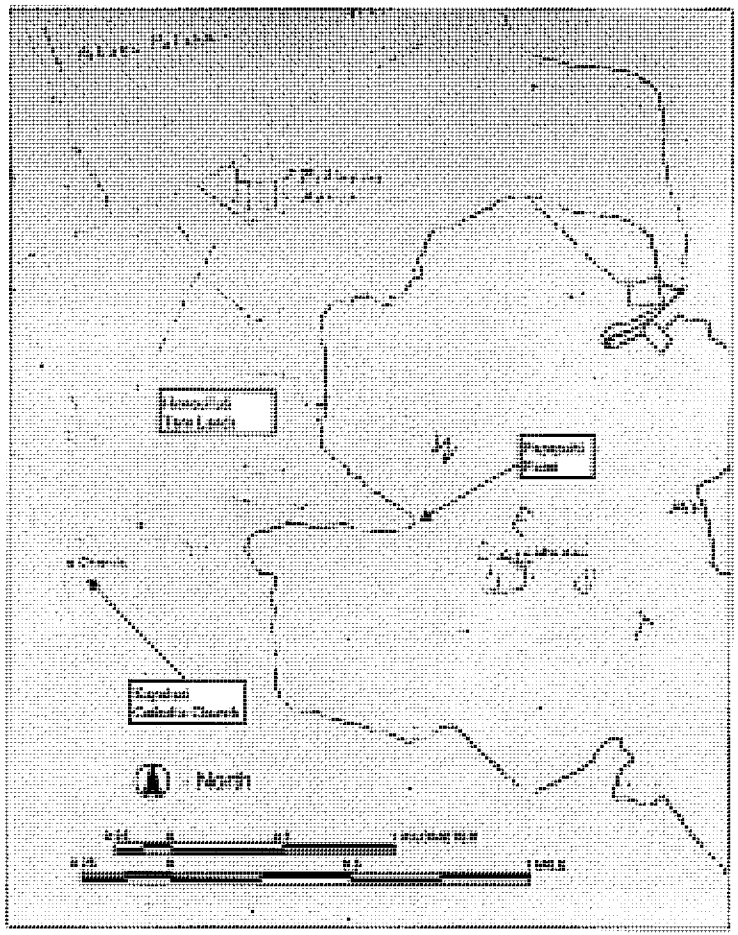

Figure 12. Portion of 1873 W.D. Alexander map of Honouliuli, showing location of Papapuhi Point (habitation symbols are illegible); also note location of Kapalani Catholic Church

AR00027613

3.2.3 Mid-Nineteenth Century and the Māhele

The Organic Acts of 1845 and 1846 initiated the process of the *māhele* - the division of Hawaiian lands, which introduced private property into Hawaiian society. In 1848 the crown and the *ali'i* (chiefly class) received their land titles. The common people received their *kuleana* (individual parcels) in 1850.

During the *Māhele* of 1848, 72 individual land claims in the *ahupua'a* of Honouliuli were registered and awarded by King Kamehameha III (Tuggle and Tomonari-Tuggle 1997:34). The 72 *kuleana* awards were almost all made adjacent to Honouliuli Gulch, which contained fishponds and irrigated taro fields. Kepa Maly (1997, Table 3: 38-42) provides a table recording information on each award, including awardee, *'ili*, and land use of the *'āpana* (lot). A summary of the information on houses, fields, and boundary landmarks noted for each *'ili* is given below in Table 2 and *'ili* locations are shown on Figure 13.

3.2.4 Project Area Māhele Awards

A comparison of project area maps with an 1878 map surveyed by M.D. Monsarrat (Figure 14) clearly show that all or portions of certain land claims belonging to Kelia (LCA 763), Pue (LCA 869), Leleiupa (LCA 1699) and Kua (LCA 5653) lie within the project area. These LCAs were once located on the east side of the main road along Honouliuli town, but now portions lay west of the current alignment of Old Fort Weaver Road. In addition, a portion of the former site of a Catholic church, called Kapalani Catholic Church, also now lies on the west side of the current road alignment, although the church itself was probably covered by the new road itself. This church and associated school house is believed to have been the site of the ministry of a particularly notable person, Kepelino Keauokalani. A brief review of the four known LCAs within the project area follows (see Figure 13 for *'ili* locations):

Kelia's *'Āpana* ('Āp.) 1 (LCA 763)

Kelia's claimed this land situated in the *'ili* of Poohilo and Uani for his houses. His witnesses agreed with his claim, but there was a dispute over whether there were 3 or 4 houses within the parcel. All agreed Kelia has one house there and that his father, Pueeu had two. The west or Wai'anae boundary was described variously as the "*pali* of Makaaku," "a ravine" or "a cliff." The claimant received his house lot from his father Pueeu and "has accepted it ever since 1836."

Pue *'Āpana* 1 and *'Āpana* 2 (LCA 869)

Pue claimed four parcels in the *'ili* of Maui at Honouliuli, 'Ewa. One parcel was a houselot and had two houses on it, one for himself and one for Puali who was his father-in-law. The western side was bounded by the land of Koi, the *luna* (overseer), who gave Pue's family their land in 1842. The other parcel within the project area was *kula*, pasture land to the east of the houselot.

Leleiupa *'Āpana* 1 and *'Āpana* 2 (LCA 1699)

Leleiupa 'Āpana 1 and 2 were claims for two parcels situated in the *'ili* of Maui. 'Āpana 1 was bordered on the west by the land of Koi, the overseer.

Table 2. Summary of land use and boundary landmarks recorded in Honouliuli LCA awards

'Ili	Land Use and Boundary Landmarks
Hiwalalo	*kou* trees
Ka'aumakua	houselots, *kalo* (taro) patches; *kula* (pasture/dryland agriculture), two fishponds called Mokumeha; landmarks - *kula ālialia* (salt plains), land division wall, Pānūhāhā *loko* (fishpond), Kalahu fishpond, Naholowaa pond, Honouliuli Stream (called stream of Makai'i), or *'aka'akai* (bulrush growth) of Kamo'okahi
Kailuopala'ai	*mo'i* (arable land in a long strip); on lot bounded by *'auwai* (irrigation ditch) called Panaenui
Ka'ilikahi	houselot and *kalo* patches; landmarks – highway, Kauhipuna cliff, *kapulapa* (*pamay*) thickets, meeting house
Kamilomilo	houselot and *kalo* patches
Kamoku	fenced *mo'o kalo*, *lo'i* (irrigated fields) *kalo*, houselot; landmarks – Kauhipuna pali
Kamo'okahi	bulrushes
Kapāpahi	houselots, *kalo* patches; bounded by ponds of Healani
Kapapapūhi	houselots, vineyard, *kula*, pond, trails, hog pens, and salt beds
Ka'ula'ula	*mo'o* next to Kaufaula (cliff) with a houselot and a wall
Loloulu	*kalo* patches, 1/3 of a fishpond (in land of Kahakuli'ili'i), hala grove, pig pens, breadfruit, bulrushes
Maka'u	houselot and *kalo* patches
Maui	*kalo* patches, *kula*, houselots, bounded by *pā'āina a ke Aupini* (land division wall of the government)
Mokumeha	2 fishponds, salt beds (western one called Kohumakahou)
Niuke'e	*kalo* patches, *kula*, potato field, houselots; landmarks - *loko kalo* (taro/ fishpond) of Nihola, Loko'eli pond, Kehewanakawalu pond, Kalokoiki pond, *pali* of Kihewamakawela; Ka'akau *pali*; Ka'akau community, meeting house, prison plot, cattle fences
Pulapola	*kalo* patches; houselots, school house, prison plot; some bounded by *pā'āina a ke Aupini*, or high road from the sea, or Catholic Chapel yard
Pō'ohilo	*kula*, *kalo* patches, *loko kalo*, houselots; landmarks - *pā'āina*, Ka'aimanō fishpond, *kula* of Kahakai, *loko kalo* of Kalokoloa, Aimea Pond, Waianu pond, Kahui pond, Ka'aimano fishpond, *pupuhi* cave (wet cave?), prison plot, Makaakua pali, Puehuehu Stream, Puehuehu road
Pua'alu'u	*lo'i*, houselot

AR00027615

Kua (LCA 5623)

Kua claimed two taro patches and a *kula* land called Kahui in the '*ili* of Maui. Of note was the sworn testimony of Maakuia on the Land Court Application for Mahina (LCA 749), which stated that the western boundary of Mahina's land was [Kaulaula] Pali, which had a wall on its top.

3.2.5 The Catholic Church

There are two land applications that make reference to a Catholic Church near the town of Honouliuli. Kaohai in April of 1850 (LCA 5670B) claimed a house site in the '*ili* of Polapola "adjoining the Catholic Chapel yard." Hilinae (LCA 1720) in November of 1847 made a houselot claim in the '*ili* of Polapola bounded on the west by the Kapalani Church. Little is known about the Kapalani Roman Catholic Church. It is clearly annotated on Monsarrat's 1878 map (see Figure 14) and is the lone "church" pictured on an 1873 map of the Honouliuli district by Alexander (Figure 15). Even the name is uncertain, as Kapalani probably means "the Frenchmen's" church. Efforts to found a Catholic Mission in Hawai'i were initially met with hostility until the issuing of an edict of toleration in 1839. The establishment of the Catholic Mission in Hawai'i in May of 1849 initiated an active period of building churches and schools. The Kapalani church (and school house) cited in the Land Court Application of Hilinae in November of 1847 must have been constructed within the previous seven years. Father Raymond Delande was pastor of the Leeward District of the church from 1857-1885 and, operating out of Honouliuli, he covered an area extending as far as Makaha and Waialua. "Up to 1877, he had baptized 600 children and adults, all living along the SW coast of Oahu" (Schoofs 1978:110).

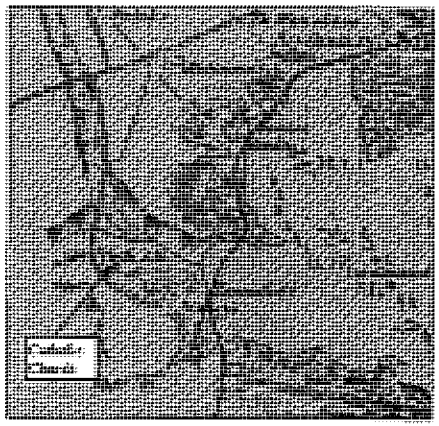

Figure 15. Portion of 1881 Hawai'i Government Survey Map (Alexander) showing location of the Catholic Church

Of particular interest is the association with this church of Kahoali'ikumaieiwakamoku Kepelino (Zepherino) Keauokalani, whose name means "to-be-the-chief-of-the-nine-districts" (Beckwith 1978:4). His father was Namiki, of the lineage of the high priest Pa'ao and his mother, Kahiwa Kaneikopulei, was a daughter of Kamehameha I. They had two children, the son Kepelino, and a daughter named Puahau. Namiki was the "old savage" whose narratives were collected by Jules Remy as "Contributions of a Venerable Savage to the Ancient History of the Hawaiian Islands" during his travels in the islands between 1851 and 1855. In a note on a section concerning the priest Pā'ao, the author talks about Namiki's son, who he met in 1853.

> The old historian Namiki, an intelligent man, and well versed in the secrets of Hawaiian antiquity, has left precious unedited documents, which have fallen into our hands. His son, Kuikauai, a school-master at Kailua, one of the true historico-sacerdotal race, has given us a genealogy of his ancestors which ascends without break to Paao [Remy 1857, in Nordhoff 1974:253].

The family was of Kailua, Kona, Hawai'i and converted to Catholicism very quickly after the arrival of Fathers Walsh and Ernest Herutel of the Catholic Mission to Kona in 1840. His parents sent him to Catholic school in Honolulu in 1845 to become a teacher. Father Ernest writes:

> Father Martial writes me about our little Zepherin, telling me that he has been received as teacher but that because they have no school to give him as yet, he has not received his diploma. Father Desire wants to keep him to send to the High School; but when will you have a High School? Perhaps not so soon. I think therefore that Zepherin would be more useful here as we lack teachers [cited in Beckwith 1978:4].

As noted above, Remy claims that at some point, Kepelino was a school teacher in Kailua; although Remy is believed to have met Kepelino in 1853, his teaching position at Kailua could have dated to an earlier period, possibly around 1845, when Father Ernst suggested that he return to the island of Hawai'i from Honolulu. At some point he attended the Catholic High School at Ahuimanu (established in 1846), where he is said "to have acquired English, French, Latin, and Greek" (Beckwith 1978:5). In 1847, at the age of 17, he was sent briefly with Father Ernest to Tahiti to help establish a Catholic mission. He developed a reputation for his pranks and was sent back to his parents (Beckwith 1978:5).

Controversial letters under the name of Z. Kahoali'i, addressed from the town of Honouliuli on O'ahu, were published in Catholic newspapers from 1860-1869. A letter in the Public Instruction Correspondence filed and dated 11/26/1851, written by a school teacher name Naheona to the Minister of Public Education, state his reasons for the rejection of a teacher "Kepilina" and accuses Kepilina of "dancing and thieving while employed as teacher of Honouliuli School and of general improper conduct." The letter also mentions "Catholic priests in the area who have been among the people for a while who do not recommend retaining Kepilina" (In Silva 1987:A8). It seems quite probable that Kepelino lived at Honouliuli from 1851 into the 1870s and that as a devout Catholic and teacher that he taught at the school house next to Kapalani Church.

Detailed biographic information on Kepelino is not readily available, which is probably due in part to the fact that he was "controversial" for the Catholics and for the government. He went on

AR00027616

to become Queen Emma's secretary (by at least 1874) and was one of the most important documenters about Hawaiian beliefs and traditions. He supported Queen Emma as the heir of King Lunalilo over David Kalākaua, and wrote letters to the king of Italy and the queen of England, asking for warships to support Queen Emma's cause. In 1874, the newly elected King Kālakaua had him tried for high treason and sentenced him to hanging, but the sentence was commuted and he was released from prison in 1876; he died in 1878 (Day 1984:77).

"The Honouliuli church . . . had by the 1880s outlived its usefulness and become dilapidated. It was therefore abandoned and replaced by a simple structure close, too close to the mill" [at 'Ewa Village, south of the project area] (Schoofs 1978:111). However, "in 1891 Honouliuli was still important enough to acquire its own Catholic cemetery" (Schoofs 1978:110). Whether this cemetery or any other Catholic cemetery was on the grounds of the Kapalani Church in unknown. In the late 1920s, Bishop Alencastre exchanged land at Honouliuli with Campbell Estate for land at 'Ewa Village to establish a new church.

3.2.6 Honouliuli Māhele Awards to *Ali'i*

In 1855 the Land Commission awarded all of the unclaimed lands in Honouliuli, 43,250 acres, to Miriam Ke'ahikuni Kekau'ōnohi (Royal Patent #6971 in 1877; Parcel #1069 in the Land Court office), a granddaughter of Kamehameha I, and the heir of Kalanimōkū, who had been given the land by Kamehameha after the conquest of O'ahu (Indices of Awards 1929; Kame'eleihiwa 1992). Kekau'ōnohi was also awarded the *ahupua'a* of Pu'uloa, but she sold this land in 1849 to Isaac Montgomery, a British lawyer.

Kekau'ōnohi was one of Liholiho's (Kamehameha II's) wives, and after his death, she lived with her half-brother, Luanu'u Kahalai'a, who was governor of Kaua'i (Hammatt and Shideler 1990:19-20:20). Subsequently, Kekau'ōnohi ran away with Queen Ka'ahumanu's stepson, Keli'iahonui, and then became the wife of Chief Levi Ha'alelea. Upon her death on June 2, 1851, all her property was passed on to her husband and his heirs. A lawsuit (Civil Court Case No. 348) was brought by Ha'alelea in 1858, to reclaim the fishing rights of the Pu'uloa fisheries from Isaac Montgomery, and the court ruled in Ha'alaea's favor. In 1863, the owners of the *kuleana* lands deeded their lands back to Ha'alelea to pay off debts owed to him (Frierson 1972:12). In 1864, Ha'alelea died, and his second wife, Anadelia Amoe, transferred ownership of the land to her sister's husband John Coney (Yoklavich et al 1995:16).

3.2.7 Early Ranching in on the 'Ewa Plain

John Coney rented the land to James Dowsett and John Meek in 1871, who used the land for cattle grazing. In 1877, the land, except for the *'ili* of Pu'uloa, was sold to James Campbell. He drove off 32,237 head of stock belonging to Dowsett and Meek and to James Robinson and constructed a fence around the outer boundary of his property (Bordner and Silva 1983:C-12). He let the land rest for one year and then began to restock the ranch, so that he had a head of 5,500 head after a few years (Dillingham 1885, cited in Frierson 1972:14)

In 1880-81, the Honouliuli ranch was described as:

> . . . Acreage, 43,250, all in pasture, but possessing fertile soils suitable for agriculture; affords grazing for such valuable stock. The length of this estate is no less than 18 miles. It extends to within less than a mile of the sea coast, to the westward of the Pearl River inlet. . . . There are valuable fisheries attached to this estate . . . . [Bowser 1880:489].
>
> From Mr. Campbell's veranda, looking eastward, you have one of the most splendid sights imaginable. Below the house there are two lochs, or lagoons, covered with water fowl, and celebrated for their plentiful supply of fish, chiefly mullet. . . . Besides Mr. Campbell's residence, which is pleasantly situated and surrounded with ornamental and shade trees, there are at Honouliuli two churches and a school house, with a little village of native huts [Bowser 1880:495].

Most of Campbell's lands in Honouliuli were used exclusively for cattle ranching. At that time, one planter remarked "the country was so dry and full of bottomless cracks and fissures that water would all be lost and irrigation impracticable" (Ewa Plantation Co. 1923:6-7). In 1879, Campbell brought in a well-driller from California to search the 'Ewa plains for water, and the well, drilled to a depth of 240 feet near Campbell's home in 'Ewa, resulted in ". . . a sheet of pure water flowing like a dome of glass from all sides of the well casing" (The Legacy of James Campbell n.d., cited in Pagliaro 1987:3). Following this discovery, plantation developers and ranchers drilled numerous wells in search of the valuable resource. A Hawai'i Visitor Bureau, marker, located in the southwestern portion of the project area, bears the inscription "Site of First Artesian Well in the Hawaiian Islands drilled by James Ashley for James Campbell owner of Honouliuli Ranch brought in on Sept. 22, 1879." Kuykendall (1967:III, 67) states that this well was "near Campbell's ranch house" but Campbell's ranch house, which is shown on Monsarrat's 1878 map, was located outside the project area.

3.2.8 History of the Ewa Sugar Plantation

3.2.8.1 General History of the Plantation

In 1886, Campbell and B. F. Dillingham put together the "Great Land Colonization Scheme," which was an attempt to sell Honouliuli land to homesteaders (Thrum 1886:74). This homestead idea failed, but with the water problem solved by the drilling of artesian wells, Dillingham decided that the area could be used instead for large-scale cultivation (Pagliaro 1987:4). During the last decade of the nineteenth century, the railroad would reach from Honolulu to Pearl City in 1890, to Wai'anae in 1895, to Waialua Plantation in 1898, and to Kahuku in 1899 (Kuykendall 1967:100). This railroad line eventually ran across the center of the 'Ewa Plain at the lower boundary of the sugar fields.

To attract business to his new railroad system, Dillingham subleased all land below 200 ft to William Castle, who in turn sublet the area to the newly-formed Ewa Plantation Company (Frierson 1972:15). Dillingham's Honouliuli lands above 200 ft that were suitable for sugar cane cultivation were sublet to the Oahu Sugar Company (Figure 16). Throughout this time, and continuing into modern times, cattle ranching continued in the area, and Honouliuli Ranch - established by Dillingham was - the "fattening" area for the other ranches (Frierson 1972:15).

AR00027617

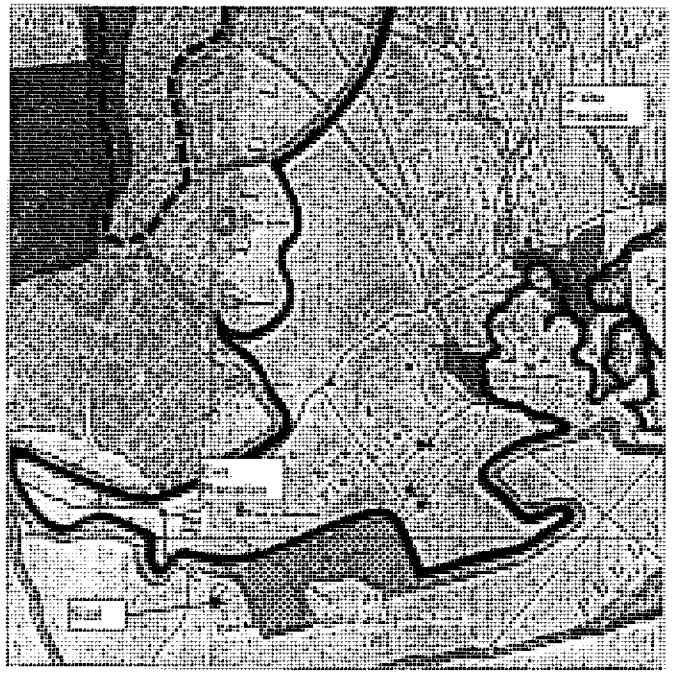

Figure 16. 1902 map showing relationship of Ewa Plantation and the Oahu Sugar Co. plantation; also note location of sisal growing area

Ewa Plantation Company (Figure 17) was incorporated in 1890 for sugar cane cultivation. The first crop, 2,849 tons of sugar, was harvested in 1892 at the Ewa Plantation. Ewa was the first all-artesian plantation, and it gave an impressive demonstration of the part artesian wells were to play in the later history of the Hawaiian sugar industry (Kuykendall 1967:69). As a means to generate soil deposition on the coral plain and increase arable land in the lowlands, the Ewa Plantation Company installed ditches running from the lower slopes of the mountain range to the lowlands. When the rainy season began, they plowed ground perpendicular to the slope so that soil would be carried down the drainage ditches into the lower coral plain. After a few years, about 373 acres of coral wasteland were reclaimed in this manner (Immisch 1964). It is uncertain if there was also a deliberate effort to induce erosion on the scarp (called Evans Bluff by the Campbell Estate), near the eastern boundary of the project area, but it would have been easy to do and probably very effective. By the 1920s, Ewa Plantation was generating large profits and was the "richest sugar plantation in the world" (*Paradise of the Pacific*, Dec. 1902:19-22, cited in Kelly 1985:171).

Just north of 'Ewa Plantation was the equally sprawling O'ahu Sugar Company which "covered some 20 square miles . . . ranging in elevation from 10 feet at the Waipio Peninsula . . . to 700 feet at the Waiahole Ditch" (Condé and Best 1973:313) (see Figure 16). The Oahu Sugar

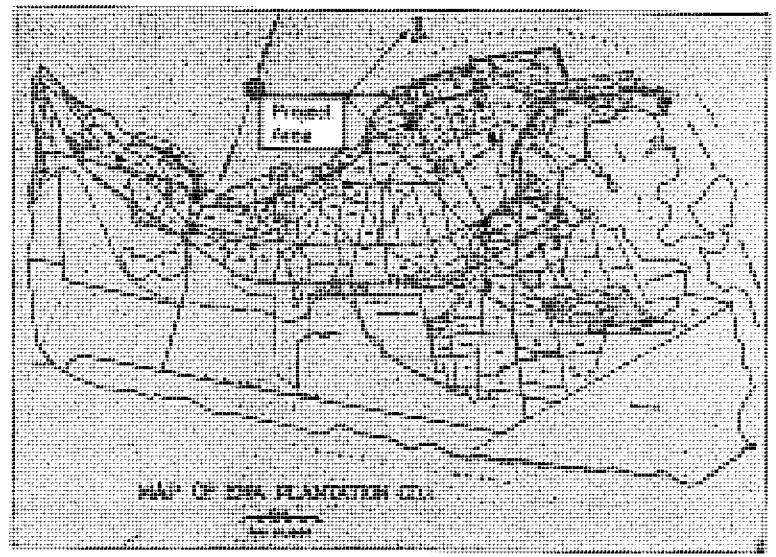

Figure 17. 1939 map of the Ewa Plantation Co. lands, showing project area

AR00027618

Company was incorporated in 1897. Prior to commercial sugar cultivation, the lands occupied by the Oahu Sugar Company were described as being "of near desert proportion until water was supplied from drilled artesian wells and the Waiahole Water project" (Condé and Best 1973:313). The Oahu Sugar Company took control of the Ewa Plantation lands in 1970 and continued operations until 1995, when they decided to shut down sugar cane production in the combined plantation area (Dorrance and Morgan 2000:45, 50).

3.2.8.2 History of PipeLine Village

During the twentieth century, the Ewa Plantation would continue to grow and, by the 1930s, would encompass much of the eastern half of Honouliuli Ahupua'a. This growth impelled the creation of plantation villages to house the growing immigrant labor force working the fields. In the decade of the 1890s, the plantation built 72 houses, cottages or dwellings; in the first decade of this century, 536; in the second decade, 132; in the 1920s, 285; in the 1930s, 168; and, in the 1940s, only 35. Censuses of the Ewa Plantation population record 4,967 persons in 1928, 4,477 in 1929, and 4,100 in 1932. After the outbreak of World War II, which siphoned off much of the plantation's manpower, along with the changeover to almost complete reliance on mechanical harvesting in 1938, there was little need for the large multi-racial (Japanese, Chinese, Okinawan, Korean, Portuguese, Spanish, Hawaiian, Filipino, European) labor force that had characterized most of the early history of the plantation.

It is to be noted that in the history of construction, buildings were moved, demolished, and replaced all the time. As early as 1899, the plantation moved "the lower camp of thirty houses [believed to be duplexes built in 1890] to a position on the bluffs nearby . . . principally for sanitary reasons" (Ewa Plantation Company Annual Report for 1890).

The original location of these thirty houses is unknown. They probably were not in the area later known as "Lower Camp" and may have been in the Honouliuli Taro lands. It is also unknown where they moved to "on the bluffs," but it seems probable that they were moved to what became the west central portion of PipeLine Village near the present water pumping station in that vicinity. A 1908/1913 U.S. Army Fire Control map shows 47 houses in the area of PipeLine Village (Figure 18).

PipeLine Village was a major plantation community that lay in the central southern portion of the present project area and is shown in detail in a 1928 USGS map (Figure 19), which documents the location of about 160 houses, a church and a school. This was probably the great extent of PipeLine Village. An entry in the 1931 Annual Report of Ewa Plantation Company records that "The PipeLine Village of 162 cottages built in 1906" was dismantled and that "other cottages near [near the factory, south of the project area] were erected using the reclaimed lumber from the PipeLine Villages. Photos (Bishop Museum Visual Collection) dated 1906 (Figure 20) show what appears to be brand new single family residences at PipeLine Village, but the Annual Report for 1906 documents the construction of only 47 houses and many of there were probably not built in PipeLine Village. Photos dated 1907 (Figure 21) show houses at PipeLine village with very well established garden and tall banana, papaya, and many mango trees, suggesting that they are significantly older. Another photo dated January 1910 (Figure 22) shows a line of ten new cottages with the caption "Pipe Line Village (Family houses built

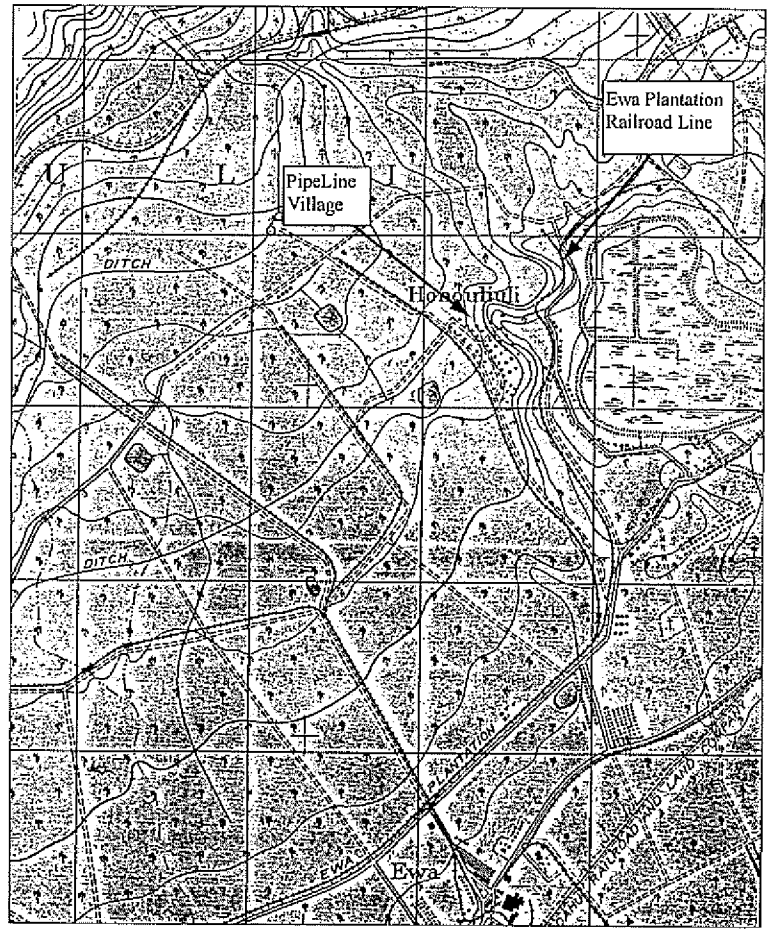

Figure 18. Portion of an 1908/1913 U.S. Army Fire Control map, showing 47 houses in PipeLine Village; map also shows the alignment for the Ewa Plantation railway

during 1909)." A 1907 photo (Figure 23) shows blocks of houses separated by wooden fences, and a *forno*, a brick Portuguese bread oven in the center. One hundred and twenty-nine cottages were built for married laborers in that year and they include the majority of the houses at PipeLine Village. In 1911 "60 new houses, principally for Spanish and Portuguese workmen with families" were erected. Thus, it seems highly probable that PipeLine village was largely constructed between 1906 and 1911, but may have incorporated a number of relocated structures dating to 1890. The demolition of 1931 was probably quite thorough, and not a trace of the structures was found on later maps.

3.2.8.3 History of Stable Village and Drivers Village

The Ewa Plantation housing located in the southeastern corner of the project area, just north of the present Hale o Ulu School, is not well-documented. It appears that there were at least two small villages located here: "Stable Village" and "Drivers Village." The Ewa Plantation Company Annual Report for 1931 states that "The Drivers Village, located near the main stable was in such a bad location that it was decided to move all the fourteen cottages down to 'B' village near the factory." Drivers Village doubtlessly corresponds to the site of the 14 houses shown on the 1927/1928 map (see Figure 19), with Stable Village probably referring to the structures just to the south across the street. The date of construction of these villages is unknown. No houses are shown in this area on the 1908/1913 Fire Control map (see Figure 18). The villages were probably built in that flurry of construction in the first decade of this century. All of the structures of Stable Village and Drivers Village are shown on the War Department Map of 1943, but this map may be another example of a lack of military intelligence regarding the Pearl Harbor area; records indicate that the houses were probably all demolished around 1931.

3.2.8.4 Other Enterprises in Campbell Lands

As noted above, part of Mr. Campbell's lands were also used to grow rice. By 1885, 200 acres in Honouliuli were used for rice and 50 acres were used to grow bananas (article in *Pacific Commercial Advertiser*, August 15, 1885, summarized in Silva 1987:A-12). These rice fields were planted in former taro fields or in undeveloped swamps, such as those near the project area in the former Honouliuli Taro lands. The rice fields in 1882 were described by Frank Damon, during a tour of the area.

> . . . Towards evening we reached Honouliuli, where the whole valley is leased to rice planters . . . This was one of the largest rice plantations we visited. Sometimes two or three men only, have a few fields which they cultivate for themselves, and we often too came upon houses where there were eight or ten men working their own land. But the larger plantations are owned by merchants in Honolulu, who have a manager acting for them. . . . [Damon 1882:37].

In 1890, Dillingham leased all land below 200 ft to William Castle, who used most of the land for sugar cane, but also leased some lands for rice cultivation, pasture, wood lots, bee-keeping, garden crops, and quarries. Some land above 650 ft was also leased for the cultivation of canaigre, which may be a word used for pineapple (Frierson 1972:15-16).

AR00027621

An additional agricultural trial was conducted in the Honouliuli area for the cultivation of sisal, a plant used to make fibers for rope and other material. Some sisal was planted before 1898 and production continued until the 1920s (Frierson 1972:16). This was grown mainly on the coastal plain of Honouliuli in Kānehili, just *mauka* of Kualaka'i Beach (now Nimitz Beach). An article in the *Paradise of the Pacific* in 1902 described this venture in glowing terms.

> . . . The venture was made and a tract of land containing a large percentage of disintegrated coral, in the neighborhood of Ewa Plantation, where nothing else would grow, was chosen for the planting. . . . The Hawaiian Fiber Co., which Mr. Turner organized, and of which he is now manager, has 755 acres under fence, two and a half miles of which is stone wall with good gates at convenient places. . . . In a large field containing 130 acres, mauka of the Oahu Railway & Land Co. track, the first harvest is to be gathered in a few months. . . . Out of this section of 130 acres the company has figured on securing 50 tons of clean fiber, for which it is offered eight cents per pound in Honolulu or nine cents per pound in San Francisco . . . . [*Paradise of the Pacific* March 1902:17].

Although many of the fishponds at Pearl Harbor deteriorated from lack of care and lack of people to maintain them in the early nineteenth century, there was some action to reclaim these areas in the later part of the century. Some were converted to rice fields, but others were maintained as fish ponds or duck ponds. Records of the Minister of Public Instruction (1848) show that some ponds were maintained by local teachers and students, with the funds generated used for the upkeep of the school system. Some ponds as early as 1848 were also maintained by prisoners, possibly from the women's prison located at Honouliuli. In 1852, however, Levi Ha'alelea reasserted his claims to these neglected lands, when he claimed all of the mullet from this area be reserved to him (Hawaii Kingdom files, cited in Silva 1987:A-7 to A-9). During James Campbell's tenure of the land, fish ponds and Pu'uloa fishing rights were leased out to various entrepreneurs (Kelly 1985:175).

Into the early twentieth century, some Hawaiian families continued to live in Honouliuli and preserve the traditional lifestyle, including at the fishing village of Kualaka'i. One resident, Mrs. Eli Williamson, recalled:

> In the Honouliuli area the train stopped among the *kiawe* (algaraboa) trees and *molina* (sisal) thickets. We disembarked with the assorted food bundles and water containers. Some of the Kualaka'i *'ohana* (family) met us to help carry the *'ukana* (bundles) along a sandstone pathway through the *kiawe* and *molina*. The distance to the frame house near the shore seemed long. When we departed our *'ukana* contained fresh lobsters, *limu* (algae), fish and *i'a malo'o* (dried fish) . . . [Williamson in Kelly 1985:160].

3.2.9 The Military and Modern Developments

In 1891, Russian explorer Otto Von Kotzebue tried to observe Pearl River, but his group could not obtain a canoe. What he was told, however, led him to speculate on the possible importance of Pearl Harbor to the future.

> In the mouth of this river are several islands; it is so deep, that the greatest ship of the line can lie at anchor a few fathoms from the shore; and so broad, that a hundred vessels can conveniently find room in it. The entrance into the Pearl Rivers is in the same situation as the harbour of Hana-ruru; but the windings between the reefs are, however, said to render a passage more difficult. If this place were in the hands of the Europeans, they would certainly employ means to make this harbour the finest in the world [Von Kotzebue 1821:338-348].

The early missionary Levi Chamberlain was able to take an outrigger canoe trip to Pearl River, and noted the difficulty of access for larger ships.

> Kawaa took passage in our canoe to go down the harbor to a place where oysters are abundant to give orders to his people to gather a mess. The sail down the harbor was delightful . . . The passage down the creek for a number of miles was very pleasant till we got down near the reef and our course altered. We then could sail no longer as the wind was against us. The sail was lowered the mast taken down and secured across the outrigger and the rowers plied their paddles [Journal of Levi Chamberlain 1822-1849, Hawaiian Mission Schools, Storage Case 4, p. 899, from Sterling and Summers 1978:51].

The first foreign attempt to survey Pearl Harbor was made in 1840 during the U.S. Exploring Expedition, led by Charles Wilkes.

> In this district is a large inlet of the sea, into which the river Ewa empties; at the entrance of this inlet is the village of Laeloa (at Kalaeloa Point): the shore is known by the name of Pearl River or harbour, from the circumstance that the pearl oyster is found here; and it is the only place in these islands where it occurs.
>
> The inlet has somewhat the appearance of a lagoon that has been partly filled up by alluvial deposits. At the request of the king, we made a survey of it: the depth of water at its mouth was found to be only fifteen feet; but after passing this coral bar, which is four hundred feet wide, the depth of water becomes ample for large ships, and the basin is sufficiently extensive to accommodate any number of vessels. If the water upon the bar should be deepened, which I doubt not can be effected, it would afford the best and most capacious harbour in the Pacific. . . . [Wilkes 1970:79].

Although Wilkes was impressed by the harbor, he was not at this time thinking of how this survey could benefit the American government in the future. In fact, Wilkes (1970:79) concluded, "As yet there is no necessity for such an operation, for the port of Honolulu is sufficient for all the present wants of the islands, and the trade that frequents them."

This had changed in less than 30 years, however. The U.S. military had tried to make a coaling station on Midway Island in 1869 by blasting through the coral reef to make a harbor; this plan failed. In 1873, General Schofield presented a confidential report to the U.S Secretary of War, recommending that Pearl Harbor should be available to the U.S. Navy. Schofield wrote:

AR00027622

> In case it should become the policy of the Government of the United States to obtain the possession of this harbor for naval purposes, jurisdiction over all the waters of Pearl River with the adjacent shores to the distance of 4 miles from any anchorage should be ceded to the United States by the Hawaiian Government. . . .
>
> The cession of Pearl River could probably be obtained by the United States in consideration of the repeal of the duty of Sandwich Island sugar. Indeed, the sugar –planters are so anxious for a reciprocity treaty, or so anxious rather for free trade in sugar with the United States, that many of them openly proclaim themselves in favor of annexation of these islands of the United States [Sen. Ex. Docs, 52nd Cong. 2nd Sess. No. 77, pp. 150-154, reproduced in Judd 1971:Appendix 3].

This reciprocity treaty was concluded in 1876 with the provision that Hawai'i would not "lease or relinquish sovereignty to another country or any harbor, etc." In 1887, the treaty was renewed and amended and allowed the United States the "exclusive right to enter the harbor of Pearl River, in the Island of Oahu, to establish and to maintain there a coaling and repair station for the use of vessels of the United States" (Judd 1971:128).

After annexation of the islands to the United States in 1899, development began in order to make a Pacific base that could be used as a staging area for the Spanish-American War (Coletta 1985:433). Dredging of the harbor began in 1901, and additional dredging to deepen and widen the channel was conducted in 1908 and again in the 1920s. Money for the funding of the construction of dry docks and other support facilities was approved in 1908. In 1931 the Navy built an ammunition depot at West Loch on a 213-acre parcel that it had bought from the Campbell Estate. Construction of a new depot in Lualualei Valley and at West Loch Harbor began in 1931.

In the early 1930s, the U.S. Navy leased 700 acres of the Campbell Estate to build Ewa Field, a base with a mooring mast for Navy dirigibles. Although the mast was completed, the program was abandoned before the *Akron*, the designated airship for the mast, was built. In 1937, 18 miles of roads were built in the coastal Honouliuli area, and in 1939-1940 the U.S. bought 3,500 acres of land in this area (Landrum et al 1997:62-67), to build several other military camps and installations, including Barbers Point Naval Air Station, at the site of the old mooring mast.

On December 7, 1941 the Japanese Navy launched the devastating surprise attack on the United States base at Pearl Harbor and other military facilities. Although the major battle damage to the US Pacific Fleet was at its base at Ford Island in the Middle Loch of Pearl Harbor, Honouliuli did not escape unscathed.

> The Waipahu and Ewa sugar plantation, next to Pearl Harbor and the town of Wahiawa, adjoining Schofield Barracks, saw more action than did Honolulu.
>
> At Waipahu, machine gun bullets, shrapnel, and shells started two cane fires, riddled the sugar mill, hit the plantation hospital in four places, went through the roof of the company store, exploding in an electric supply warehouse, and narrowly missed many houses. In nearly all of the fields of tall cane, many of which contained terrified women and children, shells buried themselves-dozens of

> them in some concentrated areas-blasting holes in the ground the size of barrels, and flattening cane for several square yards.
>
> At Ewa, after bombing the nearby Marine airfield [at Barbers Point], enemy planes machine-gunned the plantation's main street, the mill and power plant and some 30 houses and started two cane fires [Allen 1999:20].

The attack had consequences not only for the military, but also for the civilians, mostly Japanese, who lived around West Loch.

> Two permanent local evacuations were ordered in the first month of the war, partly to remove civilians from areas which might be dangerous in event of further attack and partly to protect installations from possible sabotage or espionage activities. On a Thursday less than two weeks after the bombing, farmers adjacent to West Loch at Pearl Harbor were ordered to leave their farms by sundown. The order was modified to allow two days to prepare and the men were permitted to return to their farms during daylight until livestock could be moved and crops harvested. The displaced farmers, who had only recently been established at West Loch by the Farm Security Administration were forced to seek temporary housing with friends and relatives at Ewa plantation. Since they had invested in the enterprises practically all of their life's savings and considerable money borrowed from the FSA as well, several suffered heavy losses [Allen 1999:122].

Section 4 Previous Archaeological Research

4.1 Early Archaeological Surveys

All archaeological projects conducted in Honouliuli and Pu'uloa are listed in Table 1. Two archaeological features, a boundary *pōhaku* or rock and a *hōlua*, or sledding site, are recorded only in the Boundary Commission Reports establishing the division lines between the *ahupua'a* of Honouliuli and Hō'ae'ae (to the east). The surveyor wrote of the southern point of this boundary:

> In regard to Hoaeae . . . the point of commencement is Pōhaku Palahalaha, a well known rock, now marked by an arrow and the name "Honouliuli" on one side and "Hoaeae" on the other, which I have made the initial point of the survey . . . [Boundary Commission Vol. 1:243].

This rock is shown on the Sterling and Summer map (see Figure 9) as Pōhaku Palaha. In another boundary survey, the *pōhaku* is called a "large, flat rock" (Boundary Commission Vol. 1:249), which may indicate the origin of the name from the Hawaiian word *pālaha*, which means "flattened, wide" (Pukui and Elbert 1986:307). As the surveyor continued to walk the Honouliuli/Hō'ae'ae boundary, he marked the northern point of the division as:

> The Kamaaaina took me to the corner of Pauhala (?)-Hoaeae and Honouliuli – there is an ancient holua or sleding [*sic*] place near this – which is agreed for the ancient corner. . . [Boundary Commission Vol. 1:243].

The earliest attempt to record archaeological remains in Honouliuli Ahupua'a was made by Thrum (1906:46). He reported the existence of a *heiau* located on Pu'uokapolei, west of the present study area. In a second monograph on *heiau*, Thrum (1917) called this *heiau* Palole'i (Kapolei). Emory mapped and photographed these structures in 1933 (field notes), but they were dismantled and destroyed sometime before McAllister's survey of the islands in the 1930s. According to legend, Pu'u Kapolei was the location on which Kamapua'a, the pig-god, resided with his grandmother, Kamaunuahihio (McAllister 1933:108).

In his surface survey of the 1930s, archaeologist J. Gilbert McAllister recorded the specific locations of important sites, and the general locations of less important sites (at least at Honouliuli). McAllister recorded seven specific sites at Honouliuli (numbered 133-139; McAllister 1933:107-108) (see Figure 9), and these became the first seven sites in the Bishop Museum's Site Numbering System (OA-B6-1 through OA-B6-7).

The first six sites are in the upland section of Honouliuli, *mauka* of the 'Ewa coral plain and Pu'u o Kapolei. Site 133 is a possible *heiau*, a small enclosure at the foot of Pu'u Kānehoa. It was still standing during McAllister's day, and local residents informed him of its sacred nature. Site 134 is Pu'u Kuina Heiau, located in a gulch at the foot of Mauna Kapu. Only traces of a large terrace remained. Site 135 is a series of enclosures *makai* of Pu'u Kuina Heiau. McAllister believed that the walls marked *kuleana* lots. Site 136 is a small platform near Mauna Kapu, a sacred site, possibly an altar. Site 137 is Pu'u Ku'ua Heiau, plotted on a ridge near Pu'u Ku'ua; it

had been modified for use as a cattle pen; some areas had been cleared for pineapple cultivation or planted with ironwoods. Site 138 is Pu'u Kapolei Heiau, which had been on the *makai* side of the hill before it was destroyed. The stones of the structure had been crushed in a nearby rock crusher. McAllister was also told that there was once a cave on the hill, in which Kamapua'a and his grandmother lived (McAllister 1933:107-108).

The remaining eight sites recorded by McAllister are adjacent to Pearl Harbor or the coast. Site 139 is Kalanamaihiki Ko'a (fishing shrine) at Kapapapuhi Point (north of the current study area). McAllister described it as "two large rough stones about 2.5 feet in size, with six or seven smooth stones averaging 1 foot in size in a small pile adjoining the larger stones." Site 140 is a 4-5 acre fishpond on Laulaunui Island in West Loch, opposite Kapapapuhi Point. McAllister recorded the entire West Loch of Pearl Harbor as Site 141, Kaihuopala'ai. Although some versions of the legend of the traveling mullet (see Section 3.1, Mythological and Traditional Accounts) say that there was a fishpond called Kaihuopala'ai, McAllister recorded that local informants said there was never a fishpond by that name here; rather it was the name for the loch. Site 142 is Kapamuku, or Pamoku fishpond, a 3-acre fishpond, located south of the current study area, opposite the tip of Waipi'o peninsula. Site 143 is 'Oki'okiolepe fishpond, south of Loko Pamoku. The walls of this 6-acre fishpond were made of coral.

McAllister records Site 144 as the location of fish traps and a fishing shrine described by Stokes in his study of the fishtraps of Pearl Harbor. This is the location of the fishtraps Kapäkule (Päkule) and Kepo'okala, as described by Samuel Kamakau (1976:88). McAllister listed Site 145 as Pu'uloa, a legendary site where the first breadfruit was planted. It is not known whether Pu'uloa referred to is the '*ili* of Pu'uloa or the harbor of Pu'uloa, or an area within the '*ili* near the harbor. Site 146 covers the entire 'Ewa coral plain. This includes historic features, such as cattle walls and the walls near the Pu'uloa Salt Works, pre-Contact sites such as habitation,

agricultural, and fishpond sites recorded by early European explorers, and paleontological sites, where in recent years many fossil bird bones have been discovered (McAllister 1933:108-110).

Between McAllister's 1930s study and the flurry of work that began in 1969, there are only a few sporadic pieces of research, which are not well documented. In 1933, Dr. Kenneth P. Emory recorded a well-preserved house site and a possible *heiau* (later destroyed by sugar cane cultivation) in the western part of the coral plains (Sinoto 1976:1). In 1959, William Kikuchi removed a number of burials from a burial cave site (Bishop Museum Site OA-B6-10) at the Standard Oil Refinery, which was subsequently destroyed (Barrera 1975:1). Kikuchi recovered 12-16 incomplete primary and/or secondary burials cached in a sinkhole or crevice exposed during construction activities near the big bend in Malakole Road (Kikuchi 1959; Davis 1990b: 146, 147). In 1960, Yoshi Sinoto and Elspeth Sterling visited a house site (BPBM. Site OA-B6-8) within 'Ēkaha Nui Gulch. "Around this elevation (1200 feet), along the sides of the stream, were seen remains of many terraces and some house sites" (Sterling and Summers 1978:37). In 1962, Lloyd Soehren recorded another secondary human burial in a sinkhole at the Barbers Point Naval Air Station (Davis 1990a:147). In 1966, Lloyd Soehren carried out salvage excavations at a possible fishing shrine (BPBM. Site # 50-OA-B6-13). The site was reported as destroyed by construction (Barrera 1975:1), but Davis relocated the shrine and performed additional excavations in 1982 (Davis 1990a;148).

4.2 Previous Archaeological Work near Honouliuli town

Beginning in the late 1970s, archaeological research has been conducted in Honouliuli in the general vicinity of the present study area (Figure 24). Work has been focused on the West Loch Estates (east of the current project area), Pearl Harbor Naval Magazine (NAVMAG) – West Loch (east of the current project area), the 'Ewa Gentry project (south of the current study area), and 'Ewa Villages (south of the project area).

4.2.1 West Loch Estates

An archaeological reconnaissance survey (Rosendahl 1987c) was conducted in association with the development of the 232-acre "West Loch Estates" Residential Increments I and II (golf course and parks) project, which lies to the east of the present study area, in the section of the Honouliuli Taro lands adjacent to Pearl Harbor. This project covered portions of the old town of Honouliuli, the focus of population in the early historic period (and possibly earlier). This study identified a modern cemetery (Site 3319) with a remnant pre-Contact deposit, two historic sites of minimal integrity with some possible pre-Contact deposits (Site 3318 and 3320) at Kapapapuhi Point, a significant pre-Contact deposit with trash pits, fire pits and at least one human burial (Site 3321), a buried fishpond (Site 3322), an historic fishpond (Site 3323) built in the 1890s during the construction of the OR& L railroad, and a buried pond field system (Site 3324) (Rosendahl 1987c:7, 9). It was noted that some artifacts "indicate the possibility of pre-1900 occupation" (Rosendahl. 1987c:8). As noted in the final reconnaissance survey report (Dicks et al. 1987:28) for the surface and subsurface reconnaissance survey, an effort was also made to relocate McAllister's Site 139, Kalanamaihiki Ko'a (fishing shrine). The archaeologists

AR00027626

Figure 24. U.S. Geological Survey topographic map, showing previous archaeological project areas near the current study area

found a small boathouse and dock in the area and concluded that the shrine had been destroyed since McAllister's survey in the 1930s.

A total of 21 radiocarbon dates were determined; at Site 3321, the cultural deposit, the age of a lower cultural deposit was dated to A.D. 540-880, while an upper deposit was dated to A.D. 1327-1640. For the buried fishpond (Site 3322), ages ranged from A.D. 70-610 in the lowest layer to A.D. 1160-1410 in the upper layer. For the buried pond field systems (Site 3324), ages ranged from B.C. 400-A.D. 240 (interpreted as the original surface of the upper valley) in the lowest layers to A.D. 1430-1952 in the upper layers of upper valley area and A.D. 1020-1280 in lower valley area. In summary, the authors (Dicks et al. 1987:78-79) concluded that agricultural use of the Honouliuli Stream floodplain for pondfield cultivation of taro may have begun in the lower valley segment as early as A.D. 1000, while cultivation of the upper valley pondfields may have begun as early as the thirteenth and fourteenth centuries. Site 3321in the upper valley may have been a habitation locus established as early as the mid-sixth to mid-ninth century (Wolforth et al. 1998).

In 1989, a burial was found on Ho'ae'ae Point (formerly called Papapuhi Point), when someone was digging under a mango tree on a residential property. There is no follow-up report (Bath 1989) to whether the bones were left in place or disinterred. The burial was given the site designation 50-80-13-4816.

4.2.2 NAVMAG – West Loch

In 1978, Sinoto conducted an archaeological reconnaissance survey on a 32-acre portion of NAVMAG-West Loch. A sinkhole 200 m inland and northwest of 'Oki'okiolepe Fishpond was found, containing ten human burials (Site 50-80-13-2310). Historic artifacts were found in the pit, enough to determine that the pit was probably used by the Chinese in the historic period as a family crypt (Sinoto 1978a).

Davis and Burtchard (1991) conducted an archaeological inventory survey of a 36-acre lot for a proposed housing area in the Pu'uloa portion of NAVMAG-West Loch in 1991. No archaeological sites were found. They concluded that extensive alteration to the landscape due to military land disturbance had erased all surface traces of pre-Contact habitation.

In 1992, a crew from Archaeological Consultants of Hawai'i, Inc. (ARCH) conducted an archaeological inventory survey with subsurface testing, and later data recovery at the proposed Pu'uloa Golf Course (Kennedy et al. 1992). A total of 72 sites were identified, 47 from the pre-Contact/early historic period and 25 sites associated with ranching, military training, and modern quarrying. Radiocarbon dates of these habitation, agricultural, and ceremonial sites indicate that traditional Hawaiian use extended from A.D. 1090 to 1695.

An overview survey of the NAVMAG Lualualei was completed by Ogden Environmental and Energy Services in 1977 (Landrum et al. 1977). A total of ten sites had been previously recorded in the West Loch project area, three in the Honouliuli section, one within Pearl Harbor (Site 140, Laulaunui Island), five on Waipi'o peninsula, one in both (salt works), and one encompassing all lands (Pearl Harbor Navy Base). In Honouliuli, the sites were Site 141, Kaihuopala'ai (West Loch), Site 142, Loko Pamoku or Kapamuku, Site 143, 'Oki'okiolepe Fishpond, and salt works at Honouliuli (no site designation). NAVMAG-West Loch is considered part of the Pearl Harbor Navy Base (Site 50-80-13-9992) due to its importance during World War II. The site was listed

AR00027627

as a National Historic Landmark in 1966, on the National Register of Historic Places (NRHP) in 1966, on the State Inventory of Historic Places (SIHP), in 1971, and on the State Register of Historic Places in 1971 (Landrum et al. 1977:160).

In 1996, a crew from Paul H. Rosendahl, Ph.D., Inc. (PHRI) completed a Phase I archaeological reconnaissance survey of the 1,483 acres of land at the U.S. Naval Magazine – West Loch Branch (Jensen and Head 1997). This survey covered the southern section of Waipi'o peninsula on the east side of West Loch, Laulaunui Island, the Naval Reservation on the west side of West Loch, and the West Loch Outleased Cultivated Lands, which included the National Wildlife Refuge. Only 25% of the outleased lands were actually surveyed. The PHRI crew found that most of the outleased area had been bulldozed for sugarcane cultivation. Only a small strip adjacent to West Loch was unmodified. In the West Loch Outleased Lands, eight features were recorded; all but one was associated with military use of the area. The seven military sites consisted of six concrete slabs (Sites 50-80-13-5040, 5080, 5081, 5133, 5134), a metal container (5080), and a pressure tank (5133). The one non-military site (4971) was a cave with a partially blocked (blocked with roof fall) entrance that the crew members believed should be investigated in the future to see if it at one time was used as a pre-Contact or historic burial site (Jensen and Head 1997:85).

In 1996, a field reconnaissance of Laulaunui Island and fishpond was conducted by the State Historic Preservation Division (Corbin et al. 1996) to determine if restoration of the fishpond was possible and if the site would be a good candidate to be used as an educational tool. The crew simply walked to the island from the West Loch Waterfront Park; water depth varied from one to four ft. Five concrete structures, probably built by the military, were observed. The fishpond was surrounded by mangroves and was silted in; portions of a coral wall (about 500 ft long) around the pond were still intact, and a concrete gate allowed water to circulate into the pond.

4.2.3 'Ewa Villages

In 1990, Cultural Surveys Hawaii conducted an archaeological reconnaissance survey of a 616-acre area, which included three extant plantation villages, (Renton, Tenney, and Varona Village), the sites of three former plantation villages (C Village, Mill Village, Middle Village), and other sites associated with the 'Ewa Plantation infrastructure (Hammatt, Shideler, et al. 1990:i). The survey found no evidence of any pre-Contact activity within the project area and recommended further documentation of some of the ruined plantation structure sites.

In 1996, Scientific Consultant Services (Spear 1996) conducted an archaeological survey in an area west of the Tenney and Varona plantation villages and north of the Honouliuli Treatment Plant. No archaeological sites were identified.

4.2.4 'Ewa Gentry Project

In the initial reconnaissance (Kennedy 1988a) of the 1,016 acre 'Ewa Gentry project area, no surface evidence of potentially significant pre-Contact remains was found. The old OR&L railroad bed/right of way (Site 50-80-12-9714) did form a portion of the *mauka* boundary. According to historic maps, a Filipino Camp for sugarcane workers once existed near the

intersection of the OR&L bed and a cane road near Ft. Weaver Road, but the archaeologists could find no surface remains for this camp.

A subsequent subsurface exploration was undertaken. Eighteen backhoe trenches were excavated; however, "no evidence of past in situ cultural activity was found anywhere in the Ewa Gentry project area" (Davis 1988).

An inventory survey was conducted in 1993 by Aki Sinoto Consulting (ASC) (Pantaleo and Sinoto 1993) for the 'Ewa Gentry Off-Site Drainage System. This proposed drainage project area is a narrow strip that extends along the western boundary NAVMAG West Loch, and is adjacent to the southern non-contiguous parcel (TMK 9-1-010:002) for the current study. An 1897 map of Pearl Harbor indicated that the OR&L railroad, salt pans, and a fishpond were within this project area; only the railroad bed was found during the ASC survey. Iron flumes and concrete culverts (one with an inscribed date of July 1935) used for sugarcane irrigation were found bulldozed to the edge of the sugar cane fields near the dropoff to the shoreline of Pearl Harbor. These were not considered historically significant due to the absence of structural and locational integrity. No further archaeological work was recommended for this project prior to commencement of construction of the drainage system.

In 2003, Pacific Legacy (McIntosh and Cleghorn 2003) conducted an archaeological survey of the proposed 'Ewa Gentry Makai Development project area, which is adjacent to the southern (*makai*) boundary of the 'Ewa Gentry project area for the 1988 surface and subsurface inventory surveys (Kennedy 1988a; Davis 1988).

4.2.5 Previous Archaeology in the Current Project Area

As noted previously, and as discussed in more detail in the next section, a 546-acre portion of the current project area (the southeastern section) was previously surveyed in 1990 by a crew from Cultural Surveys Hawai'i. In 2005, a field assessment was conducted over the entire current project area by archaeologists from the firm Archaeological Consultants of the Pacific, Inc. (Elison and Kouneski 2005). The archaeologists found one "stone-faced hill" in the northern section of the project area (north of Farrington Highway), but did not describe it further. The report presents recommendations for field work in the different sections of the project area, concluding that the majority of the project area is farm land and did not need to be surveyed. Only the area around Honouliuli Gulch, and other areas of natural vegetation in the northern section needed to be surveyed.

4.3 Background Summary and Predictive Model

4.3.1 Honouliuli Settlement Patterns

The *ahupua'a* of Honouliuli is the largest traditional land unit on the island of O'ahu. Honouliuli includes all the land from the western boundary of Pearl Harbor (West Loch) westward to the 'Ewa/Wai'anae District Boundary with the exception of the west side of the harbor entrance, which is in the *ahupua'a* of Pu'uloa (the 'Ewa Beach/Iroquois Point area). This comprises approximately 12 miles of open coastline from One'ula westward to Pili O Kahe. The *ahupua'a* extends *mauka* (almost pie-shaped) from West Loch nearly to Schofield Barracks, and

AR00027628

the western boundary is the Wai'anae Mountain crest running *makai* to the east ridge of Nānākuli Valley.

Not only is there a long coastline fronting the normally calm waters of leeward O'ahu, but there are also four miles of waterfront along West Loch. The land immediately *mauka* of the Pacific coast consists of a flat karstic raised limestone reef forming a level nearly featureless "desert" plain marked in pre-Contact times (previous to alluviation caused by sugar cultivation) by a thin or non-existent soil mantle. The microtopography is notable in containing countless sinkholes in some areas caused by chemical weathering (dissolution) of the limestone shelf.

Along the eastern flank of the Wai'anae Mountains, numerous gulches have contributed to the alluvial deposits over the coastal limestone shelf. The largest of the gulches is Honouliuli Gulch, which drains into West Loch. The gulches are generally steep-sided in the uplands and generally of a high gradient until they emerge onto the flat 'Ewa plain. The alluvium they have carried has spread out in delta fashion over the *mauka* portions of the plain, which comprises a dramatic depositional environment at the stream gradient change. These gulches are generally dry, but during seasonal Kona storms carry immense quantities of runoff onto the plain and into the ocean. As typical drainages in arid slopes they are either raging uncontrollably, or are dry and, as such, do not form stable water sources for traditional agriculture in their upper reaches. The Honouliuli gulches generally do not have valleys suitable for extensive irrigated agriculture; however, this lack is more than compensated for by the rich watered lowlands near West Loch.

Honouliuli Ahupua'a, as a traditional land unit, had abundant and varied resources available for exploitation by early Hawaiians. The "karstic desert" and marginal characterization of the limestone plain, which is the most readily visible terrain, does not do justice to the *ahupua'a* as a whole. The richness of this land unit is marked by the following available resources:

1) 12 miles of coastline with continuous shallow fringing reef, which offered rich marine resources.

2) Four miles of frontage on the waters of West Loch, which offered extensive fisheries (mullet, *awa*, shellfish), as well as frontage suitable for development of fishponds.

3) The lower portion of Honouliuli Valley in the 'Ewa plain offered rich level alluvial soils with plentiful water for irrigation from the stream as well as abundant springs. This land would have stretched well up the valley.

4) A broad limestone plain, which because of innumerable limestone sinkholes, offered a nesting home for a large population of avifauna. This resource may have been one of the early attractions to human settlement.

5) An extensive upland forest zone extending as much as 12 miles inland from the edge to the coastal plain. As Handy and Handy (1972:469) have pointed out, the forest was much more distant from the lowlands here than it was on the windward side, but on the leeward side was more extensive. Much of the upper reaches of the *ahupua'a* would have had species-diverse forest with *kukui*, *'ōhia*, sandalwood, *hau*, *ti*, banana, etc.

Within this natural setting, archaeological and traditional sources show a general pattern of three main areas of settlement within the *ahupua'a*: a coastal zone, the Honouliuli taro lands, and inland settlement at Pu'u Ku'ua.

4.3.2 The Coastal Zone - Kalaeloa (Barbers Point), Ko'ōlina (West Beach)

Kalaeloa (Barbers Point)

Archaeological research at Barbers Point has focused on the areas in and around the newly constructed Deep Draft Harbor (Barrera 1975; Davis and Griffin, 1978; Hammatt and Folk, 1981, McDermott et al. 2000). Series of small clustered shelters, enclosures and platforms show limited but recurrent use at the shoreline zone for marine-oriented exploitation. This settlement covers much of the shoreline with more concentrated features around small marshes and wet sinks. Immediately behind the shoreline, under a linear dune deposit, is a buried cultural layer believed to contain some of the earliest habitation evidence in the area.

The attraction of the area to early Hawaiians was the plentiful and easily exploited bird population. Particular evidence for taking of petrels occurs at Site -2763 (Hammatt and Folk, 197:213). Initial heavy exploitation of nesting seabirds and other species in conjunction with habitat destruction probably led to early extinction. There is some indication of limited agriculture in mulched sinkholes and limited soil areas. Considering rainfall, this activity would have been limited, but probably involved tree crops and roots (sweet potatoes). The archaeological content of the sites indicates a major focus on marine resources.

Davis and Griffin (1978) distinguish functional classes of sites, based on surface area size and argues that the Barbers Point settlement consists of functionally integrated multi-household residence groups. Density contours of midden (by weight) and artifacts (by numbers) plotted for residence sites by Hammatt and Folk (1981) generally indicate narrowly defined spatial foci of discard, possibly indicating continuous use, or at least with no refurbishing or additions to the structures through time (Hammatt and Folk 1981). The focus is small habitation sites, typically lacking the full range of features found in large permanent residence complexes such as high platforms, complex enclosures, and ceremonial sites.

Ko'ōlina (West Beach)

There are three available studies on the Ko'ōlina project area (Davis et a. 1986a; Davis et al. 1986b; and Davis and Haun 1987).

Davis documents around 180 component features at 48 sites and site complexes consisting of habitation sites, gardening areas, and human burials. Chronologically the occupation covers the entire span of Hawaiian settlement, in what Davis and Haun describe as "one of the longest local sequences in Hawaiian prehistory" (Davis and Haun 1987:37). The earliest part of the sequence relates to the discovery of an inland marsh, and early dates were also obtained for the beachfront site and an inland rock shelter.

4.3.3 Honouliuli Taro Lands

Centered around the west side of Pearl Harbor at Honouliuli Stream and its broad outlet into the West Loch are the rich irrigated lands of the *'ili* of Honouliuli, which give the *ahupua'a* its name. The major archaeological reference to this area is Dicks, Haun, and Rosendahl (1987) who

AR00027629

documented remnants of a once-widespread wetland system (*lo'i* and fishponds) as well as dryland cultivation of the adjacent slopes. The current study area is within this environmental zone.

The area bordering West Loch was clearly a major focus of population within the Hawaiian Islands, and this was a logical response to the abundance of fish and shellfish resources in close proximity to a wide expanse of well-irrigated bottomland suitable for wetland taro cultivation. The earliest detailed map (Malden 1825) shows all the roads of southwest O'ahu coalescing and descending the *pali* (cliff) as they funnel into the locality (i.e. Honouliuli Village). Dicks et al. (1987:78-79) conclude, on the basis of 19 carbon isotope dates and 3 volcanic glass dates that "Agricultural use of the area spans over 1,000 years." Undoubtedly, Honouliuli was a locus of habitation for thousands of Hawaiians. Pre-Contact population estimates are a matter of some debate but it is worth pointing out that in the earliest mission census (Schmitt 1973:19) 1831-1832, the land (*'āina*) of Honouliuli contained 1026 men, women, and children. It is not clear whether this population relates to Honouliuli Village or the entire *ahupua'a*, but the village probably contained the vast majority of the district's population. The nature of the reported population structure for Honouliuli (less than 20% children under 12 years of age) and the fact that the population decreased more than 15% in the next 4 years (Schmitt 1973:22) suggests that the prehistoric population of Honouliuli Village may well have been significantly greater than it was in 1831-1832. A conservative estimate would be that tens of thousands of Hawaiians lived and died at Honouliuli Village.

4.3.4 Pu'uku'ua: Inland Settlement

Documentation of inland settlement in Honouliuli Ahupua'a is more problematic in that there are relatively few documented archaeological sources. However, it is probable that the area around Pu'uku'ua, on the east side of the Wai'anae Ridge seven miles inland of the coast, was a Hawaiian place of some importance.

In 1899, Hawaiian Newspaper *Ka Loea Kālai'āina* relates a story of Pu'uku'ua as "a place where chiefs lived in ancient times" and a "battle field," "thickly populated." The article summarizes:

> There were two important things concerning this place. (1) This place was entirely deserted and left uninhabited and it seems that this happened before the coming of righteousness to Hawai'i Nei. Not an inhabitant is left. (2) The descendants of the people of this place were so mixed that they were all of one class. Here the gods became tired and returned to Kahiki [*Ka Loea Kālai'āina*, July 8, 1899, translated in Sterling and Summers 1978:33].

McAllister recorded three sites in this area, two *heiau* (134, 137) (Pu'u Kuina and Pu'uku'ua, both destroyed) and a series of enclosures in Kukuilua which he called "kuleana sites" (McAllister 1933). On the opposite side of the Wai'anae range, along the trail to Pōhākea Pass, Cordy (2002:36) states "Kākuihihewa was said to have built (or rebuilt) Nōi'ula, a *pō'okanaka heiau* (1,300 sq. m.) in Hālona in upper Lualualei, along the trail to Pōhākea Pass leading into 'Ewa, ca. A.D. 1640-1660" (Cordy 2002:36). There is no direct archaeological evidence available to the authors' knowledge that intensive Hawaiian settlement occurred here, but it is considered as a place of high probability, based on the above indications. John Papa 'Ī'ī (1959)

described a journey that Liholiho took which led him and an entourage through inland Honouliuli and over Pōhākea Pass. Geographically, the area receives sufficient quantities of water and would have had abundant locally available forest resources.

4.3.5 Summary

On the basis of archaeological studies, informed by historic records, the following may be concluded:

1) There are three areas of Hawaiian settlement in the *ahupua'a*; two are well-documented and one is problematic:
   a. the extensive limestone plain with recurrent use habitations for fishermen and gatherers and sometime gardeners;
   b. the rich cultivated lands of Honouliuli 'ili for extensive wetland taro and clearly the *ahupua'a* population center; and,
   c. the uplands around Pu'uku'ua associated with *kauwā* residence but probably used for agriculture and forest resources.

2) Honouliuli is designed as a unit to contain all the geographic elements of a typical Hawaiian valley *ahupua'a*, except they are arranged geomorphically in an atypical relationship. The *ahupua'a* is not organized around a single drainage network but shares the west portions of Waikele drainage in its upper reaches. A typical and highly advantageous characteristic for human subsistence is included in a vast coastline and fringing reef, an extensive limestone plain which would support only limited agriculture but would be excellent for bird catching in early times, and a huge expanse of sloping forest land. The richest forest land for foraging for wood, birds, feathers, etc. would have been the east slope of the Wai'anae Range. The surveys by Bordner (1983) and Hammatt and Shideler (1999) at Waimānalo Gulch indicated no evidence of Hawaiian occupation, but the gulch has been impacted in modern times (Bordner 1983).

3) The *makai* slope was not a major thoroughfare. We can see some very limited evidence of part-time agriculture in and around gulches and two foci of sparse habitation. The first is limited to *makai* portions of gulches and lava flats. This habitation is considered a *mauka* component or continuing of the Ko'olina coastal settlement rather than an independent focus. The second focus, separated from the first by a barren zone, is generally above the 800-foot elevation. This *mauka* habitation which could have been supported by seasonal dry land planting and forest foraging may be the lower portion of a thinly scattered, but widespread zone of settlement which stretches eastward and northeast along the east Wai'anae Range slopes and may increase in intensity along the more watered lands forming the *mauka* western boundary of Honouliuli.

4) There is to date no archaeological evidence of high status residence in Honouliuli. Large residential structures are not present along the Pacific shoreline where they would be expected. The late prehistoric occurrence of chiefs' houses is not apparent, perhaps because the ocean shoreline, although rich in marine resources, is uninviting for sport and

AR00027630

unsuitable for fishponds. The chiefly focus of 'Ewa District was Waipi'o. Whatever activities of this class occurred in Honouliuli would have been in or near the rich lands fronting West Loch (the *'ili* of Honouliuli). Concerning status associations with Honouliuli, it is interesting to note the connection of the Pu'uku'ua settlement with slaves (*kauwā*), the lowest class of Hawaiians (Sterling and Summers 1978:33).

5) The focus of population and agriculture within the *ahupua'a* of Honouliuli was the *'ili* of Honouliuli. There is good reason to assume, given the lack of intensive agricultural resources in other prehistoric times, all other habitation zones were economically and socially co-dependent.

Section 5 Results of Fieldwork

5.1 1990 Survey Findings of the West Loch Bluffs Project Area

In 1990, the southeastern portion of the project area (a 546-acre parcel south of Farrington Highway then called West Loch Bluffs) was surveyed by CSH members (Hammatt and Shideler 1990). Five sites were recorded and given SIHP permanent site numbers (Figures 25-29). In addition, four areas of historical importance were researched. For the recent survey, these five previously identified sites were revisited and notes were made on their current condition. In addition, during the recent inventory survey, backhoe testing was conducted in the four areas identified in the 1990 CSH report as possibly containing important historical deposits or artifacts. Table 4 summarizes the findings of the 1990 survey and Figure 25 shows the location of sites and historically documented areas from the 1990 CSH survey.

Table 4. Sites Previously Identified during the 1990 CSH survey

SIHP 50-80-12-	Description	Function	Age
4344	Plantation infrastructure; 3 pipe features (destroyed sometime between 1990 and 2005)	Sugar cane cultivation and irrigation	Ewa and Oahu Plantation operated from 1890 to 1995
4345	Stone-faced Berm	Ewa Plantation Railroad Berm	The Ewa Plantation Railroad operated from 1890 to 1947
4346	Stone-lined Well & Associated Features	Pumping Station (Northern)	Pre-1928 to present
4347	Stone-lined Well & Associated Features	Pumping Station (Central)	Pre-1928 to present
4348	Stone-lined Well & Associated Features	Pumping Station (Southern)	ca. 1928 to present
No SIHP numbers were assigned to the next four areas since there were no surface remains			
	Land Court Awards (LCAs) in Honouliuli Taro Lands	Habitation and Agriculture	Documented in 1848; surviving to at least 1890 (founding of Ewa Plantation)
	Kapalani Catholic Church	Church, School, Residence; possibly cemetery	Built between 1840 and 1847 and destroyed between 1885 and 1890
	PipeLine Village	Plantation Camp for Portuguese and Puerto Rican workers; also a school and church	Some houses possibly built in 1890; main construction phase of 162 houses from 1906 to 1911; demolished in 1931
	Drivers and Stable Villages	Plantation Camp	Drivers Village probably built between 1900 and 1910; it was moved to a new location (outside the project area) in 1931; Stable Village seems to have consisted of only four houses

AR00027632

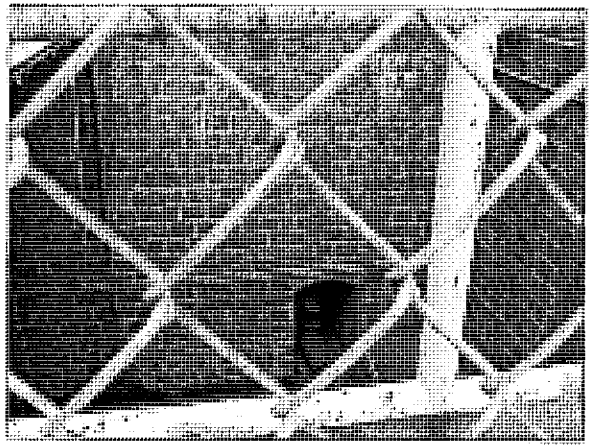

Figure 28. Site 50-80-12-4347, well wall of central pumping station, view to the north

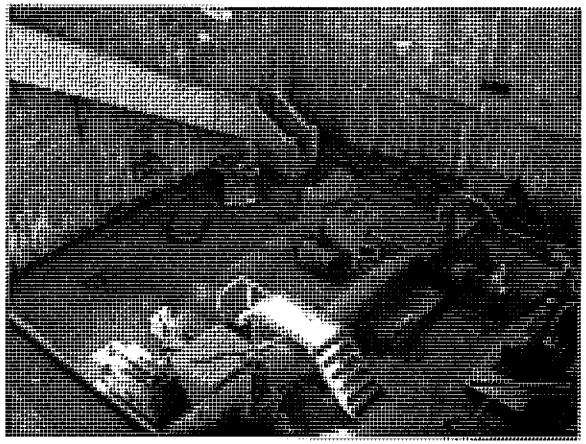

Figure 29. Site 50-80-12-4348, interior well of southern pumping station, view to the west

5.1.1 Sites Recorded during the 1990 Survey

There are three pumping stations within the project area, all which feature rectangular stone faced pits 9 m deep. The northern two (but not the southern one) appear on the 1927/28 USGS map. The southern one was built before 1946. A photo (Bishop Museum Visual Collection) dated 1923 shows what appears to be a brand new "Riedlier Steam Pump Driven by Triple Expansion Corlis Engine" in one of these large stone-faced rectangular wells.

An important part of life within the camps of the project area was the Ewa Plantation Company Railroad, which operated from 1890-1947. Near its peak in 1931, the Plantation Railway system included 18.95 miles of 36" gauge permanent track, 8 miles of portable track, seven oil-burning Baldwin locomotives, and 705 cars (Conde and Best 1974:283). Permanent rail lines ran from the southwest to the northeast up through the middle of the project area along the present can-haul road alignment and also near the eastern margin of the project area. In 1947, the rails were sold for scrap.

During the subsequent decades of the twentieth century, sugar cane operations in 'Ewa phased out and, more recently, former cane lands have been rezoned for residential development. Structures in the area of the former plantation villages have fallen into disrepair or have been demolished. However, portions of the area - including Varona Village, Tenney Village, and Renton Village - have been designated the 'Ewa Villages Historic District (State site 50-80-12-9786), which has been nominated for National Historic Landmark status. Additionally, the still-extant OR&L rail line through Honouliuli has been placed on the National Register of Historic Places (Site 50-80-12-9714).

5.1.1.1 Ewa Plantation Infrastructure (Site 50-80-12-4344)

In the immediate vicinity of the site of Drivers and Stable Villages, the 1990 CSH survey found three iron pipe features, including a tall metal post and two welded pipe constructions. These were collectively given SIHP number 50-80-12-4344, because they were tangible features, which by appearance and location, appeared to be more than 50 years old. The significance of these constructions is thought to exist only in so far as further determination of their age and function elucidate out record of Ewa Plantation life. During the recent CSH 2005 inventory survey, these features could not be refound; the area of their former location had been bulldozed and they had been destroyed.

5.1.1.2 Ewa Plantation Railroad (Site 50-80-12-4345)

The Ewa Plantation Co. ran a private railroad for the primary purpose of hauling cane; it included nearly 30 miles of permanent track. The railroad operated from 1890 to 1947, but most of the permanent track was in place by 1910 (Conde and Best 1973:280). It has been the policy of the Historic Sites section of the SHPD to encourage the retention of particularly good section of railroad berm. While many kilometers of permanent track ran through the project area, a particularly good example is only to be found in the northeastern portion of the project area in the mouth of the dry stream valley, in the traditional *'ili* of Maui. This stretch of the Ewa Plantation Railway was given SIHP number 50-80-12-4345. The railroad berm on either side of the valley access road features well-preserved facings commonly 2 m high. It is recommended that if the railroad berm in this area can be incorporated into development plans and preserved,

AR00027633

that this be done. If development plans require the demolition of a portion of this stretch of railroad berm then mitigation should be worked out with the State Historic Preservation Office in advance.

5.1.1.3 Ewa Plantation Pumping Stations (Sites 50-80-12–4346, -4347, and- 4348)

There are three pumping stations within the project area, all of which feature a deep rectangular basalt block, faced wall. The northern two (Sites -4346 and –4347) are thought to pre-date 1928 and the southern well (Site –4348) is thought to date to shortly thereafter. All three are still extant in the project area. The wells are very impressive structures and are of particular importance to the history of 'Ewa. It is recommended that these wells be preserved. If these wells are deemed a hazard or these area are required by development plants, it might be possible to fill, mark, and cover the wells. All three of the site designations for these wells include adjacent structures. In the case of the northernmost (Site –4346) and the southernmost (Site –4348) wells, the adjacent structure is limited to a single pump house, which has an exterior or corrugated sheet metal panel construction. Evaluation of possible historic significance of these structures is beyond our area of expertise, and it is recommended that issues of significance and proper historic documentation be resolved with the SHPD office in advance of any development of these areas to avoid adverse impacts.

The case of the Central Pump house (Site –4347) is more complicated, in that there are eight features related to the well. In addition, there are a number of small architectural and/or industrial features in the immediate vicinity of the well. In some cases, the age and exact function of these features in unclear. We recommend preservation of at least portions of this site. The significance of the area of Site –4347 would be evaluated after an assessment of the significance of its architectural features and the assessment of the significance of the Ewa Village area. If development of this area is desired, mitigation should be discussed with the SHPD Office.

5.1.2 Historically Documented Areas Identified during the West Loch Bluffs Project

Background research for the West Loch Bluffs report (Hammatt and Shideler 1990) also highlighted four other areas of concern:

5.1.2.1 Hawaiian Land Court Awards in the Honouliuli Taro Lands

An area along the northern portion of Old Fort Weaver Road that was once called the '*ili* of Maui. It contained house sites and taro patches tended by native Hawaiians, according to 1848 Māhele LCA testimony.

A house site (belonging to Pue) is shown on Monsarrat's map of 1878, and the presence of several more house sites in this area is clearly indicated in land records circa 1848. It seems very likely that any stones from pre-contact or early historic foundations would have been removed to facilitate cane cultivation and possibly for used in the construction of the adjacent Ewa Plantation railway berm. Is seems highly probably that plowing associated with pre-drip irrigation cane cultivation has badly disturbed sediments to a depth of nearly a meter (36 inches). However, it was thought possible that slope wash from induced erosion had sealed and protected these deposits and had thus insulated these deposits from the impact of subsequent plowing.

There many be intact gravels or other cultural deposits associated with this area. Thus it was recommended in the 1990 survey report that subsurface testing take place in this area before development.

5.1.2.2 Kapalani Catholic Church

There is an area along the southern portion of Old Fort Weaver Road that once had a Roman Catholic Church, shown on the Monsarrat map of 1878 as a fenced area enclosing three structures believed to include a church, a school, and a residence. This church (Kapalani Church) was built between 1840 and 1847 and is believed to have been destroyed between 1885 and 1890. From old survey maps, it appears that part or all of the site of the church structure is directly under Old Fort Weaver Road. However, this area is still of archaeological concern for its association with an important person in the history of Hawai'i and because there may be associated historic graves.

It seems highly probable that the Honouliuli Roman Catholic church site within the project area was a major focus of the life of Kahoaliikunaiewakamoku Kepelino (Zepherino) Keauokalani, who is best known by the name Kepelino. Kepelino was a major historian and the author of four fascicles that appeared from 1858-1860, called Hooiliili Hawaii "Hawaiian Collection" and his Mo'olelo Hawaii "Traditions of Hawaii" in 1868 (Valeri 1985:xxv-xxvi). He is of particular importance because he came from a family of high priests, he was a grandson of Kamehameha, he was Queens Emma's secretary, and he was the only major Hawaiian historic of the time who was not a pupil of the Lahainaluna School. Letters to Catholic newspapers dated 1860-1869, under the name Z. Kahoali'i place him in Honouliuli, and it seems probable that he lived in Honouliuli from 1851 into the 1870s. As he was known as an ardent Catholic and a school teacher, it seems likely that he taught for many years at the school within the Roman Catholic Church compound at Honouliuli (now covered by Old Fort Weaver Road).

Another issue regarding the Roman Catholic Church site area is that of graves. A history of the Roman Catholic Church in Hawai'i (Schoofs 1978:110) reports that, after the abandonment of the church, "in 1891 Honouliuli was still important enough to acquire its own Catholic cemetery." We know of only on Roman Catholic Church property in Honouliuli, and that is the church property within and adjacent to the project area. It is possible, therefore, that this cemetery was adjacent or on these church grounds. While the site of the Honouliuli church has been under sugar cane cultivation for many decades, the 36-inch plow zone many not have disturbed any historic interments, if present. Because no trace of this church was found on the surface during the CSH 1990 survey, no site number was given, however, additional background research into this church and subsurface backhoe testing before any development was recommended (Hammatt and Shideler 1990:55).

5.1.2.3 Ewa Plantation PipeLine Village

PipeLine Village was a substantial community including 162 houses (some duplexes), a school, and a church. PipeLine Village was also known as Spanish Camp because its residents were largely of Puerto Rican and Portuguese ancestry. Most of the structures in PipeLine Village are believed to have been built between 1906 and 1911, but it seems highly probably that there were a few older structures, possibly including some of the oldest structures of Ewa Plantation, dating to 1890. The village is believed to have been completely demolished in 1931.

AR00027634

All of the many photos of PipeLine Village houses (Figure 30, Figure 31, Figure 32, and Figure 33) show house foundations consisting of wood posts resting on small light colored blocks (tofu block construction). Thus, there would be virtually no trace of a building footprint after the building was dismantled. The only archaeological remains associated with this village that would be likely to survive 60 years of subsequent cane cultivation would probably be related to the privies, which were typically detached outhouses. If these were pit privies, there should be more than 160 discernible pits with associated durable artifacts, which might include bottles, coins, and personal effects. Some plantation privies had detachable compartments, which would be periodically emptied. If this type of privy was utilized, there would probably be no trace left. It is believed that refuse collection was highly organized by the plantation from early times and this disposal was outside of the present project area. There could however, be small trash pits.

The Ewa Plantation Company Annual Report for 1923 states that "coral roads were laid through villages" and it may well be that the grid of streets shown on the 1928 USGS map could be determined on the ground once the cane was cleared. There are also photos of Portuguese bread ovens (*forno*), which appear to be constructed of brick and plaster, but these were probably all demolished and completely removed. There may have been building slabs or other more durable features to the schoolhouse and church, but there are believed to have been bulldozed as well. It is anticipated that with the possible exception of privy pits and associated artifacts, that the thoroughness of demolition, the light nature of construction, and the sixty years of continuous cane cultivation would have removed almost all other traces of PipeLine Village.

Subsurface reconnaissance of the site of PipeLine Village was recommend in this area for the purpose of gaining further data regarding the layout of the village and for the recovery of artifacts, which might be useful in the study of ethnicity and the interpretation of Ewa Plantation village life. In the absence of any identifiable intact surface cultural features, no site number during the 1990 CSH survey was given to the former site of PipeLine Village.

5.1.2.4 Drivers and Stable Villages

Drivers Village and Stable Village were small communities previously located in the southeastern corner of the project area. Little is known about these villages. A 1931 Ewa Plantation Report states "The Drivers Village, located near the main stables was in such a bad location that it was decided to move all the fourteen cottages . . ." It seems highly probable that Drivers Village consisted of the fourteen structures shown on the 1928 map, that it was constructed between 1900 and 1910 and that it was moved in 1931. Stable Village seems to refer to the few structures just across the street to the south. As with PipeLine Village, the 1990 CSH report recommended reconnaissance after the removal of sugar cane and subsurface testing for the purpose of gaining further data regarding the layout of the village and the recovery of artifacts, which might be useful in the study of ethnicity and in the interpretation of Ewa Plantation village life. No site number were assigned to these village in the absence of any tangible clearly-related remains.

5.2 2005 Surface Inventory Survey Findings

A surface pedestrian survey was conducted in the main project area on November 21 and 22, 2005 and January 13, 2006. Approximately 75% of the project area consists of plowed fields with low vegetation (pumpkins, squash and other ground vegetables). All roads surrounding these plowed fields were surveyed by car or by foot. In the southwestern section of the project area (south of Farrington Highway), only a linear corridor along an irrigation ditch had some (natural) weedy vegetation. This area was surveyed by foot. The southeastern section of the project area is a 546-acre parcel that was previously surveyed by CSH in 1990. Those areas with previously identified sites and areas selected for backhoe testing were revisited and additional notes were taken on the present condition of sites and areas. In the northern section of the project area (between I H-1 and Farrington Highway), larger sections of the project area were traversed on foot. Both banks of the Honouliuli Gulch were surveyed, the entire project area east of the gulch was surveyed, and a small weedy area in the northwestern corner of the project area was surveyed. The remaining portions of the main project area are plowed fields planted in crops or land covered with farm buildings.

Two non-contiguous parcels were surveyed by foot on January 13, 2006. The southern parcel (TMK 9-1-010:002) consisted of a triangular area bounded by a residential area, the West Loch Estates, on the west and Plantation Road on the west and south. The east side is bounded by the proposed Ewa Gentry Drainage Ditch, which was surveyed in 1993 (Sinoto and Pantaleo 1993). It is bisected by Arizona Road. The section south of Arizona Road is plowed fields; the northern section is covered with low grass and *koa haole* trees; the ground is extremely hummocky, as if it has been recently bulldozed (see Figure 5). Based on historic maps, Sinoto and Pantaleo (1993) thought they might find the remains of a portion of the OR&L track and sugar cane irrigation flumes in their project area. They found part of the OR&L roadbed berm, and also found the remains of metal flumes and concrete culverts, but these had been bulldozed into piles near the West Loch shoreline. These remains were not considered significant due to the absence of structural and locational integrity. During the recent CSH survey of the area, only a few concrete culverts, bulldozed into a ditch along the western border of the parcel, were found. The northern non-contiguous parcel (TMK 9-2-001:001) surrounds a reservoir north of the H-1 Interstate. This area has also been extensively bulldozed; the reservoir has been filled (is level with the surrounding ground) and a berm has been constructed around the former rim. There were no structural remains found in this area.

Four new features were recently identified in the project area. All four were found in the northern portion of the main project area along Honouliuli Gulch (Figure 34 and Figure 35). During the 1990 inventory survey of the West Loch Bluffs (southeastern 546-acre parcel), three sugar cane plantation infrastructure features (three pipe features) were grouped into Site 50-80-12-4344. Since all four new features found during the recent 2005 inventory survey are also related to sugar cane plantation infrastructure, these features have been subsumed into the same site designation. In this portion of the project area, Honouliuli Stream extends generally from the northwest to the southeast, but one portion is oriented east-west.

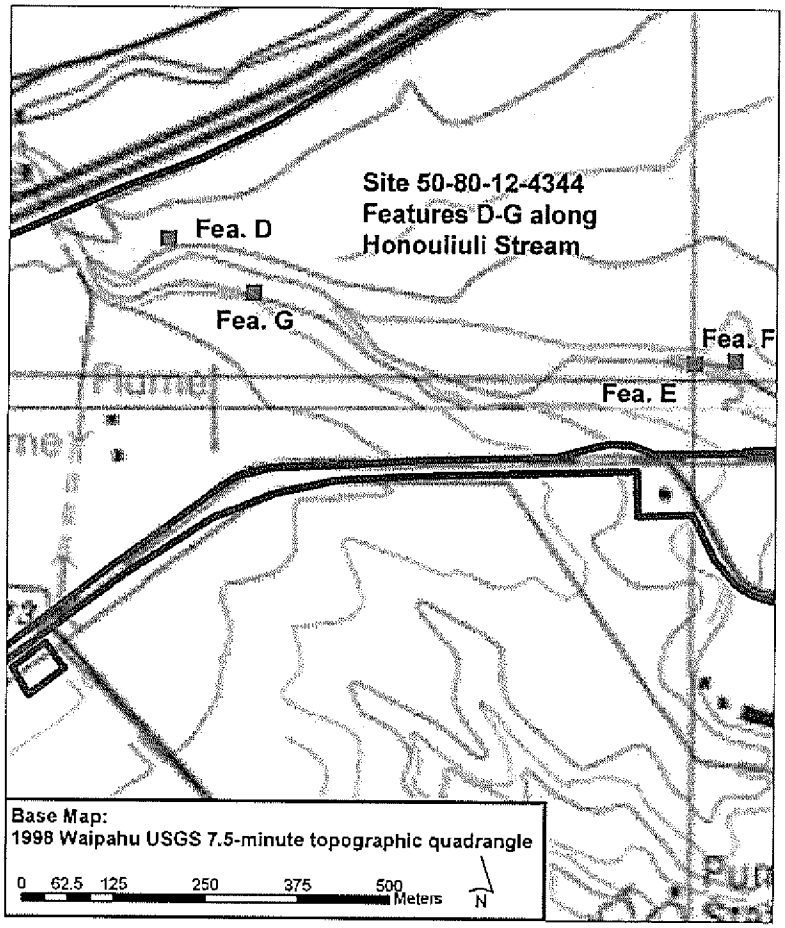

Figure 34. US Geological Survey map, showing location of Features D-F of Site 50-80-12-4344 along Honouliuli Stream

Figure 35. Typical vegetation in Honouliuli Gulch, view to the south

AR00027637

Site 50-80-12-4344, Features D-G

Feature D is a linear wall built against (parallel) to the east (or north) bank of Honouliuli Gulch (Figure 36 and Figure 37). It is 16 m long, 90 cm wide, 1.1 m high, and is oriented at a 77/277° angle. The wall is at the rim of the gulch. It is constructed of subangular basalt cobbles and boulders, 30-60 cm in diameter, stacked five to six courses high. One side abuts the gulch rim and the other side is faced; in some cases, the rocks have been split with metal tools, so that the outer side has a vertical face. Based on the location and construction, the wall functioned for erosion control.

Feature E is a linear wall on the west (or south) bank of Honouliuli Stream (Figure 38 and Figure 39). It is built perpendicular to the orientation of the gulch and is built on a slightly sloping terrace area near the top rim of the gulch. The wall is 4.5 m high, 55 cm wide, and 50 cm high. It is a core-filled wall, with basalt boulders 30-60 cm in diameter on the sides, and smaller cobbles in the interior. The function is unknown, but core-filled walls are usually historic in age. Its location near Honouliuli Gulch suggests it functioned for water or erosion control.

Feature F is a stone-faced berm on the west (south) bank of Honouliuli Stream at the top of the gulch rim (Figure 40 and Figure 41). It is constructed perpendicular to the orientation of the stream. The berm is faced with stones (some cut with metal tools to make a vertical face) on the northern side, stacked 6 to 8 courses high. The wall is not vertical, but slopes outward at the base. The construction is somewhat unusual in that the largest stones (up to 70 cm in diameter) are placed in the middle courses, not at the base, as is usual. The top of the berm is not particularly even and slopes down towards the gulch. The construction of this berm suggests it was constructed as some type of loading area, so that some type of vehicle could be parked or structure could be constructed on top of the berm, possible for loading or storing sugar cane or water.

Feature G consists of a concrete ditch and a concrete masonry catchment basement on the west (or south) bank of Honouliuli Gulch (Figure 42 and Figure 43). A metal pipe at the base of the flume and basin extends underground towards Honouliuli Gulch down a 45° slope at a due north/south orientation. The ditch is rectangular and 5.5 m long, 40 cm wide and 30 cm deep. The top of the ditch is covered with concrete slab lids, 90 cm long, 40 cm wide and 7 cm thick. The ditch itself is made with separate Waialua-type modal concrete units, which were made at the Ewa Plantation for their irrigation projects. The basin is C-shaped, constructed of rocks and mortar. The basin is 1.35 m long north/south, 1.3 m wide, 90 cm deep, with walls 28 cm thick. The outer side has an inset area that may once have had some type of sign or plaque. The ditch was used for irrigation or water control by the Ewa Plantation Company.

5.3 2005 Backhoe Test Excavations Findings

Backhoe testing was conducted in four selected portions of the project area on November 28 and December 7 and 8, 2005. A total of 19 trenches were excavated in the project area in four specific areas (Figure 44 and Figure 45), the Honouliuli Taro Lands (5 trenches) adjacent to the northern portion of Old Fort Weaver Road, the probable location of the Kapalani Catholic Church (7 trenches) adjacent to the southern portion of Old Fort Weaver Road, the former site of Drivers and Stable Villages (1 trench) near the southeastern corner of the project area, and the former site of PipeLine Village (6 trenches) in the south-central section of the project area.

5.3.1 Roman Catholic Churchyard

Seven trenches (BHT 1-6, BHT 19) were excavated around the probable site of the Roman Catholic churchyard. As noted previously, a comparison of modern and nineteenth century maps indicates that the church building itself was once located under the present alignment of Old Fort Weaver Road. Only a small portion of the churchyard extended on the west side of the present road. There are fenced-in fields in this portion of the project area where staked beans are planted. There is only a small portion of open ground between this fenced-in area and a tall berm along the road. The seven trenches were placed around the sides of the fenced field and between the fields and the road berm. No shaped stones, mortar, cultural layers, or artifacts were found in any of the seven trenches.

Trenches 1-3, on the north side of the bean field, had complex stratigraphies with several silty loam or silty clay layers, probably deposited during flooding episodes. An old roadbed was present as the upper stratum of Trenches 4, 5, 6, and 19 (along the east side of the field adjacent to Old Fort Weaver Road). This is probably the old alignment of Fort Weaver Road, thus the yard of the Roman Catholic Road was probably located east of our trench placement. Either it was located under the present alignment of Old Fort Weaver Road, under the shoulder of the road, or under the earth berm adjacent to the road shoulder. Trench 4 had modern black plastic fragments (used for weed control in the gardens) at a depth of 210 cm. Another trench (Trench 3) had coral cobbles or boulders at depths of 150 cmbs, indicating a significant amount of soil disturbance in these trenches adjacent to the road.

Stratigraphic profiles for these seven trenches are illustrated in Figure 46 to Figure 52, with the stratigraphic soil descriptions following.

5.3.2 Honouliuli Taro Land Trenches

Five trenches (BHT 7-11) were excavated in the Honouliuli Taro Lands area. This portion of the project area was thickly vegetated with low (ca. 1 m tall) *koa haole* trees and larger '*opiuma* (*Pithecellobium dulce*) trees. The area available for backhoe testing was circumscribed by the presence of these larger trees; trenches could only be placed in areas where the smaller *koa haole* trees could be knocked down with the backhoe. There was also a large pit in the southwestern section of this area used for flood control. This area is adjacent and east of the Ewa Plantation Railroad berm (Site 50-80-12-4345).

No shaped stones, cultural layers, '*auwai* (irrigation ditches used in wetland cultivation) organic soils (soils once used for wetland agriculture), walls, habitation platforms, boundary walls or alignments, or artifacts were found in any of the five trenches; however, many of the trenches did contain fragments of limestone mortar, asphalt, and slag to a depth of 1.7 m below surface. One *Tellina* sp. bivalve shell was found at a depth of 150 cmbs, but it was adjacent to a fragment of slag at 170 cmbs, and thus was deposited in modern times (or is in a disturbed stratum). Only one stratum of soil was found in each of the five trenches; some trenches had trash deposits. The disturbed nature of the top stratum may be related to the nearby railroad berm. Stones and even soil may have been moved and excavated from this area to build the earth and rock berm for the railway bed. The presence of limestone mortar, slag, asphalt, and charcoal lenses found in several trenches may also be associated with this berm construction and use.

The stratigraphic profiles (Figure 53 to Figure 57) and soil descriptions for the five trenches follows.

II	88-110 cmbs	Brown (10YR4/3) silty clay loam; moderate, medium subangular blocky structure; very hard when dry, slightly sticky and slightly plastic consistence; terrestrial origin; abrupt, smooth boundary;
III	110-240+ cmbs	Very dark gray (10YR3/1) clay loam; strong, coarse, angular blocky structure; extremely hard when moist, slightly sticky and slightly plastic consistence; terrestrial origin; excavation arbitrarily terminated at 240 cmbs.

5.3.3 Drivers and Stable Villages

One trench (BHT-12) was excavated in the Drivers/Stable Villages area. In the last ten years, this area has been very susceptible to floods, so much so that when water would come into this area it would wash soil onto Old Fort Weaver Road. To control these floods, the majority of this area had been bulldozed, excavated, and filled with gravel. Only a small portion of this area near the extreme southeastern corner of the project area still had some vegetation and was thought to have been undisturbed by this excavation and filling. The one trench (BHT-12) excavated in this area had two strata, separated by an asphalt layer, possibly an old roadbed. It is unlikely that this road was built for the Drivers/Stable Village, since the name "Stable" suggests that horses and mules were still the predominant method of hauling and travel in this period, not car or tractors. There were no other artifacts or material from the villages indicated by this trench excavation. The stratigraphic profile (Figure 58) and soil descriptions for Trench 12 are presented below:

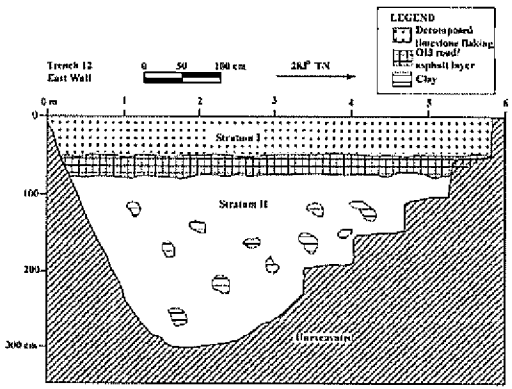

Figure 58. Backhoe Trench 12, east wall profile

Backhoe Trench 12
Stratum-Depth

I	0-50 cmbs	Very dark brown (7.5YR5/3) silt loam; moderate, medium, subangular blocky structure; slightly hard when moist, non-sticky and non-plastic consistence; terrestrial origin; with many small fragments of decomposed limestone; abrupt, smooth, boundary; old road/asphalt bed at 50-70 cmbs;
II	70-300+ cmbs	Dark brown (7.5YR3/4) silty clay loam; strong, medium blocky structure; friable when moist, slightly sticky and plastic consistence; strong cementation; terrestrial origin; soil intermixed with 50% pockets of clay; excavation arbitrarily terminated at 300 cmbs.

AR00027647

5.3.4 PipeLine Village

Six trenches (BHT-13-18) were excavated in the former location of PipeLine Village. The first trench was placed in the area thought to be the former location of the church shown on the 1927 USGS map (see Figure 19). This section of the project area is flat, open, plowed fields planted in pumpkins and squash. Trenches were placed on roads along the sides and between the plowed fields. The surface and the plow zone had a dense concentration of concrete fragments (less than 20 cm in diameter), especially near the southern section of the project area (near where the church may have been). Two to three strata were found in the six trenches. The concrete fragments were only found on the ground surface or within the loose soil, the top 20 cm of the plow zone. None were found any deeper. No privy pits were found, no food remains, no historic artifacts, and no firepits or other habitation features were found. In conclusion, it seems that when the houses of PipeLine Village were moved in 1931, little remained behind. The concrete fragments are probably fragments of the blocks on which the wooden houses rested, or are part of some of the coral/gravel roads between the house roads. The stratigraphic profiles for these six trenches (Figure 59 to Figure 64) are presented below, with the soil descriptions following.

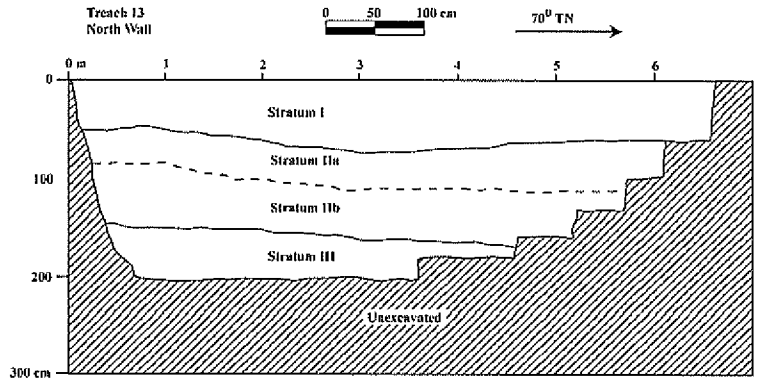

Figure 59. Backhoe Trench 13, north wall profile

Backhoe Trench 13
Stratum-Depth

I	0-60 cmbs	Dark yellowish brown (10YR3/4) silty clay loam; moderate, medium, subangular blocky structure; friable when moist, sticky and moderately non-plastic consistence; terrestrial origin; cobble-size concrete fragments found only on the surface and the upper 20 cm of loose soil; abrupt, smooth, boundary;
IIA	60-100 cmbs	Strong brown (7.5YR4/6) sandy loam; moderate, fine, subangular blocky structure; firm when moist, slightly sticky and slightly plastic consistence; terrestrial origin, diffuse, irregular boundary;
IIB	100-150 cmbs	Brown (7.5YR4/3) sandy loam; strong, medium blocky structure; friable when moist, non-sticky and non-plastic consistence; 60% gravel; terrestrial origin; clear, wavy boundary;
III	150-200+cmbs	Brown (7.5YR4/2) clay; weak, very fine prismatic structure; friable when moist, sticky and very plastic consistence; terrestrial origin; excavation arbitrarily terminated at 200 cmbs.

Backhoe Trench 18
Stratum-Depth

I	0-70 cmbs	Dark yellowish brown (10YR3/4) silty clay loam; moderate, medium, subangular blocky structure; friable when moist, sticky and moderately non-plastic consistence; terrestrial origin; cobble-size concrete fragments found only on the surface and the upper 20 cm of loose soil; abrupt, smooth, boundary;
IIA	70-183 cmbs	Strong brown (7.5YR4/6) sandy loam; moderate, fine, subangular blocky structure; firm when moist, slightly sticky and slightly plastic consistence; terrestrial origin, diffuse, irregular boundary;
III	183-250+cmbs	Brown (7.5YR4/2) clay; weak, very fine prismatic structure; friable when moist, sticky and very plastic consistence; terrestrial origin; excavation arbitrarily terminated at 250 cmbs.

Section 6 Project Summary and Mitigatiou Recommendations

During a 1990 inventory survey of the southeastern portion of the current project area (West Loch Bluffs area), five sites, a railroad berm (Site 50-80-12-4345), three pumping station (Sites 50-80-12-4346, -4347, and -4348), and three features related to plantation infrastructure (Site 50-80-12-4344) were recorded and assigned SIHP permanent site numbers. During this survey, four historic documented areas of Hawaiian and later immigrant residence were also identified: the former sites of Honouliuli Taro Lands, Kapalani Church, PipeLine Village, and Drivers/Stable Village. Further work, especially subsurface testing, was recommended for these four areas.

During the recent 2005 surface survey of non-plowed areas of the 1594-acre East Kapolei project area, four new features related to sugar cane cultivation or irrigation were recorded. These four features (Features D-G) were subsumed under the previous site number, Site 50-80-12-4344, used for scattered plantation infrastructure features.

A total of 19 trenches were excavated in the four areas of historic habitation and/or agriculture identified in the 1990 CSH survey to determine if there were any subsurface remains of: (1) nineteenth century (or earlier) habitation and agricultural lots in the Honouliuli Taro Lands; (2) structures or burials associated with the nineteenth century Kapalani Catholic Church; (3) structures or historic domestic artifacts associated with the early twentieth century Drivers and Stable Village; and, (4) structures or historic domestic artifacts or pit/privy features associated with the early twentieth century PipeLine Village. No cultural deposits, no privy pits, no burials, and no artifacts or any type were found or recovered from the 19 trenches. It seems that sugarcane cultivation, irrigation, flood control, railroad construction, later road construction, the demolition and movement of workers camps, and other factors have obliterated all, or almost all, traces of these former traditional Hawaiian habitation and agricultural lands and the later sugar cane plantation workers camps, churches, and schools.

6.1 Significance Assessments

Sites are evaluated for significance according to the broad criteria established for the National and State Registers. The five criteria are:

A	Site reflects major trends or events in the history of the state or nation.
B	Site is associated with the lives of persons significant in our past.
C	Site is an excellent example of a site type.
D	Site may be likely to yield information important in prehistory or history.
E	Site has cultural significance; probable religious structures and/or burials present.

During the 1990 survey of the West Loch Bluffs project area (southeastern section of the current project area) five sites were identified and given SIHP site designations. All five sites were determined as significant under criteria C and D. The three features (Features A-C) of Site

AR00027651

50-80-12-4344 (plantation infrastructure) were not recommended for any further work or for preservation. Sites 50-80-12-4345 (railroad berm), and Sites 70-12-4346, -4347, and -4348 (three pumping stations) were all recommended for preservation.

During the recent 2005 survey of the East Kapolei project area, four additional plantation infrastructure features adjacent to Honouliuli Gulch were identified. These features (Features D-G) were added to the Site –4344 description. The significance and recommendation for this site remains the same (no further work and no preservation); they have all had adequate documentation and do not need to be preserved.

The four areas of historic interest identified in the 1990 West Loch Bluffs survey (Honouliuli Taro lands, Kapalani Catholic Church, PipeLine Village, and Drivers/Stable Village) were not given site designations in the 1990 report since there were no surface remains. In the recent 2005 subsurface inventory of these four areas, no trace of any remains (charcoal, food remains, structural remains, cultural layers, firepits, artifacts, burials, etc.) associated with these four former habitation areas could be found. Therefore, again, these four areas are not assigned permanent state site numbers.

6.2 Mitigation Recommendations

Five sites have been previously identified in the project area during a 1990 CSH survey. Four new features were found for one of these sites during the current 2005 survey. No subsurface remains were found within 19 trenches during the recent backhoe testing of four habitation loci (Honouliuli Taro Lands, Kapalani Catholic Church, PipeLine Village, Drivers/Stable Village) (see Figure 44 for location of four habitation loci). However, it is possible that some traces of these habitation areas remain in subsurface deposits in areas not covered by the test trenches. Thus, an on-call/on-site monitoring program is recommended for these four specific areas during any future development. A summary of findings and recommendations for the project area is presented in Table 5; areas of concern for mitigation recommendations are shown on Figure 65.

Table 5. Significance and Mitigation Recommendations

Site (50-80-12)	Description	Significance	Further Work	Mitigation Recommendation
-4344 Fea. A-C	3 pipe features	C, D	None. Features were destroyed sometime between the 1990 and 2005 survey	None
-4344 Fea. D-G	Sugar cane cultivation/ irrigation features	C, D	None. The features were adequately recorded during the 2005 survey.	No preservation
-4345	Ewa Plantation Railroad Berm	C, D	Architectural Evaluation	Preservation
-4346	Northern Pumping Station	C, D	Architectural Evaluation	Preservation
-4347	Central Pumping Station	C, D	Architectural Evaluation	Preservation
-4348	Southern Pumping Station	C, D	Architectural Evaluation	Preservation
Honouliuli Taro Lands	Nineteenth century (and earlier) Hawaiian Habitation/Agricultural Area	None	No surface or subsurface remains were found during a recent 2005 inventory survey. No additional testing is necessary.	On-call/on-site archaeological monitoring during future development of the area
Kapalani Church	Nineteenth century Hawaiian Catholic Church, schoolhouse, and possible cemetery area	None	No surface or subsurface remains were found. No additional inventory survey is necessary.	On-call/on-site archaeological monitoring during future development of the area
PipeLine Village	Early twentieth century immigrant plantation habitation camp	None	No surface or subsurface remains were found. No additional inventory survey is necessary.	On-call/on-site archaeological monitoring during future development of the area
Drivers/Stable Villages	Early twentieth century immigrant plantation habitation camps	None	No surface or subsurface remains were found. No additional inventory survey is necessary.	On-call/on-site archaeological monitoring during future development of the area
