The intention was to just use known travel patterns and markets. I suppose you could apply your future year SE data and fratar the movements, but that would get kinda involved. Your zones would have to match exactly – no block groups or tracts – and the income would have to be stratified in the same way, etc. Not fun.

Dave-

Ok so obviously I got the base year conditions to work for the ARRF model but was curious if there was a recommendation or methodology for performing the task on future scenarios?? I didn't see any mention of it in the documentation so I thought I would ask. Have you guys used it for future analysis for comparisons? Or does FTA anticipate it only being used for base year/opening comparisons? I mean since it pulls the census data directly I assume it cant do future without some sort of factoring,etc/

Thoughts?
